
"When you're finished with baby, maybe you can tell me what I can do about my extra pounds."

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

he established his practice in Stanton which he continued throughout his life.

He was mayor of Stanton for about 15 years and served as County Coroner for 35 years and health officer for 47 years. A Life Member of the American Trapshooting Association, Doctor Lilly and his son twice won the national father-and-son clay target championships.

He was a Life Member of MSMS and was once president of the Ionia-Montcalm Medical Society.

J. R. McBride, M.D., Lapeer

John R. McBride, M.D., a former president of the Lapeer County Medical Society, died March 28. He was 64.

Doctor McBride was graduated from the University of Iowa Medical School in 1929 and came to Michigan in 1930. He was affiliated with the Lapeer County General Hospital in Lapeer and the McLaren General Hospital in Flint. In addition to serving as president and vice-president he also served as secretary of the Lapeer County Medical Society.

From 1942 to 1945 he served in the medical military service. He was a member of the American Legion and Phi Beta Pi fraternity.

H. C. Wass, M.D., Port Huron

Henry C. Wass, M.D., Port Huron general practitioner, died March 23 at the age of 71. Doctor Wass was a former president of the St. Clair County Medical Society.

Doctor Wass was graduated from the University of Michigan Medical School in 1927. He held a B.S. degree from Michigan State University.

In 1927 and 1928 he served in the medical branch of the U.S. Navy.

He was affiliated with Mercy Hospital in Port Huron and St. Clair Hospital.

R. J. St. Louis, M.D., Detroit

Rene J. St. Louis, M.D., Detroit general practitioner, died March 11 at the age of 80.

He was a city councilman in River Rouge from 1931-1933, was honorary fire chief of the River Rouge fire department, and served as health officer of the River Rouge Health Department.

Doctor St. Louis, who was born in Sandwich, Ontario, received his M.D. degree from the Detroit College of Medicine and Surgery in 1910. He served his internship at Harper Hospital, then entered practice in Midland. After serving in the medical military service during World War I, he began practice in River Rouge.

He was affiliated with Delray Hospital and Wyandotte General Hospital.

Doctor St. Louis was a Life Member of MSMS and a member of Nu Sigma Nu medical fraternity.

PLAINWELL SANITARIUM, INC.

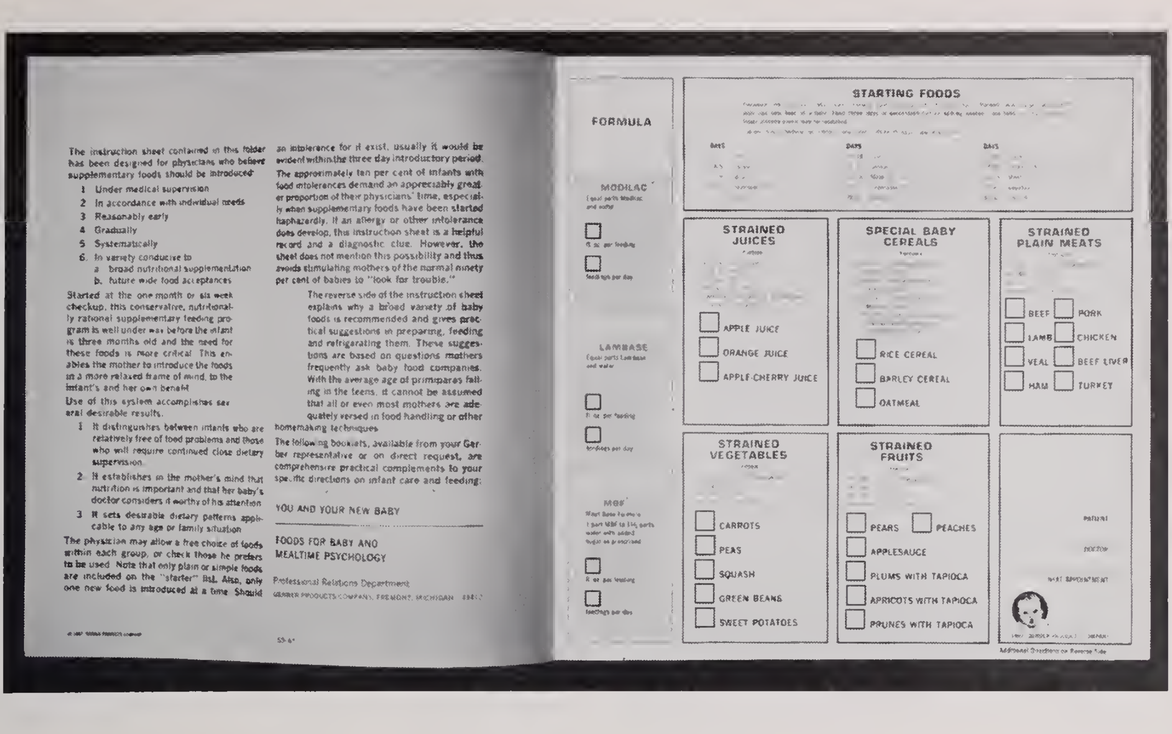
Plainwell, Michigan — MU 5-8441

Edwin M. Williamson, M.D.
M. Leroy Barry, M.D.

Dan W. Everett, M.D.
Wilbur R. King, Ph.D.

The Plainwell Sanitarium is a private psychiatric hospital licensed by the Michigan Department of Mental Health, and member of the American Hospital Association, Michigan Hospital Association, and National Association of Private Psychiatric Hospitals. Our extensive diagnostic treatment services include the following:

- Organic and psychological therapy for the psychiatrically and emotionally disturbed of all ages.
- Diagnostic evaluation of neurological disorders.
- Rehabilitative services for geriatric and convalescent patients.
- Medico-Legal counsel.
- Diagnostic and psychological evaluation and hospitalization, if indicated, of juveniles for Probate and Juvenile Courts.



The instruction sheet contained in this folder has been designed for physicians who believe supplementary foods should be introduced

1. Under medical supervision
2. In accordance with individual needs
3. Reasonably early
4. Gradually
5. Systematically
6. In variety conducive to
   a. broad nutritional supplementation
   b. future wide food acceptances

Started at the one month or six week checkup, this conservative, nutritionally rational supplementary feeding program is well under way before the infant is three months old and the need for these foods is more critical. This enables the mother to introduce the foods in a more relaxed frame of mind, to the infant's and her own benefit.

Use of this system accomplishes several desirable results.

1. It distinguishes between infants who are relatively free of food problems and those who will require continued close dietary supervision.
2. It establishes in the mother's mind that nutrition is important and that her baby's doctor considers it worthy of his attention.
3. It sets desirable dietary patterns applicable to any age or family situation.

The physician may allow a free choice of foods within each group, or check those he prefers to be used. Note that only plain or simple foods are included on the "starter" list. Also, only one new food is introduced at a time. Should an intolerance for it exist, usually it would be evident within the three day introductory period.

The approximately ten per cent of infants with food intolerances demand an appreciably greater proportion of their physicians' time, especially when supplementary foods have been started haphazardly. If an allergy or other intolerance does develop, this instruction sheet is a helpful record and a diagnostic clue. However, the sheet does not mention this possibility and thus avoids stimulating mothers of the normal ninety per cent of babies to "look for trouble."

The reverse side of the instruction sheet explains why a broad variety of baby foods is recommended and gives practical suggestions in preparing, feeding and refrigerating them. These suggestions are based on questions mothers frequently ask baby food companies. With the average age of primiparas falling in the teens, it cannot be assumed that all or even most mothers are adequately versed in food handling or other homemaking techniques.

The following booklets, available from your Gerber representative or on direct request, are comprehensive practical complements to your specific directions on infant care and feeding:

Checklist for Planned "Starting" Nutrition

A new Gerber service for physicians
The starting foods instruction sheet was designed to help assure your professional supervision and control of the introduction of supplementary infant foods. An adequate variety of *plain* foods is listed to provide latitude in prescribing for individual requirements. It is a timesaver for the selection of foods and their sequential introduction. Your rationale is explained to the mother.

Use it as a checklist
Your √ designates the use of one plain food at a time. Portions are listed and increased gradually until the food is well accepted. Should an intolerance develop, it would be evidenced in the "diary" of food experience. Diagnostic clues would be pinpointed. An alternate food could be selected.

A built-in plan of rotation
This schedule, starting with plain strained juices, provides for adding single foods in succession—one-grain cereals, strained plain meats, strained plain vegetables, strained fruits. Initiated at the one-month or six-week checkup, the system is programmed for up to forty-five days. By then, the infant will be introduced to a variety of at least fifteen foods which you have selected from the list of twenty-five.

Start as early as you wish
The system can be started at the initial checkup. Space is provided for you to indicate your choice of formula. Simply enter the amount per feeding and the number of feedings per day in the appropriate square. For normal infants, you may select the Gerber Baby Formula . . . Modilac,™ premodified milk with a near-ideal distribution of calories that has demonstrated superior growth and development.* For newborns where there is a family history of allergy or other reason to avoid milk, MBF™ (Meat Base Formula) or Lambase® can be checked.

Feeding facts your mothers should know
No starter food system is complete or workable without the understanding and cooperation of the mother. We provide for that, too. On the reverse side of the "checking" sheet, mothers are informed why the infant's diet should be based on the four basic food groups; why she should take time to teach her baby to adjust to new foods; why it is important to observe simple precautions such as transferring food from the original container if some is to be refrigerated until another feeding.

This system is yours
Your requests gave us the idea for this system. All we did was make it as flexible and easy-to-use as possible. Your Gerber Medical Service Representative will be pleased to show it to you. We invite you to inspect it closely . . . and start using it in your practice.

Michigan
State
Medical
Society

Marjorie Peebles-Meyers, M.D., Detroit,
has been named one of the "Ten Top Working Women" in Detroit. Each Spring the community salutes ten women for outstanding professional contributions and community service. Doctor Meyers is a Delegate to the MSMS House of Delegates and an Alternate Delegate to the AMA House of Delegates.

John Stirling Meyer, M.D., Birmingham,
will administer a grant of $75,600 from the U.S. Public Health Service to the Wayne State University School of Medicine for continuing the neurology training program. He is professor and chairman of neurology at WSU.

Karl S. Klicka, M.D., Wayne,
Executive Director of the People's Community Hospital Authority, was elected secretary of the new Michigan Association of Hospital Authorities.

Joseph R. Montante, M.D., Orchard Lake,
has been named Republican party organization director in the 19th Congressional District. He is a precinct captain in West Bloomfield Township Republican Party.

Allen B. Moore, M.D., Essexville,
has been appointed by Governor Romney to the eight-member Saginaw Valley College Board of Control. Doctor Moore also was head of the Easter Seal campaign conducted by the Bay County Society for Crippled Children and Adults.

Lionel F. Swan, M.D., Detroit,
president of the National Medical Association, met recently with President Johnson and presidential assistants to explain the role of the newly formed NMA foundation. The foundation's over-all program, aimed toward comprehensive care of the urban poor, includes a nationwide program of recruitment to health professions which offers financial support to deserving young people. The program is being conducted by NMA with the cooperation of the departments of Health, Education and Welfare, and Housing and Urban Development.

Otto K. Engelke, M.D., Ann Arbor,
has been appointed to the AMA Council on Environmental Health and also to the Ad Hoc Committee to Study the Modus Operandi of the Scientific Section.

Geoffrey L. Brinkman, M.D., Detroit,
will direct studies of the aging process that occurs in lungs under a $16,600 grant by tht Michigan Tuberculosis and Respiratory Disease Association to the Department of Pathology at Harper Hospital, Detroit.

William H. Knisely, Ph.D., East Lansing,
has been appointed by the Surgeon-General to the National Advisory Council on Education for Health Professions of the U.S. Public Health Service.

James C. Breneman, M.D., Galesburg,
was presented a 15-year service pin by the local draft board for work as a medical adviser. Also cited was Edmund Talanda, M.D., Kalamazoo, for five years of service to the board.

Albert D. Ruedemann, M.D., Detroit,
professor and chairman of ophthalmology in the Kresge Eye Institute, WSU, will direct the new Children's Fund, established through a $16,059 gift from the estate of Edna F. Selberg. The money will be used to purchase equipment and provide free eye services to children from the Midwest and parts of Canada.

James T. Howell, M.D., Detroit,
executive director of Henry Ford Hospital, has been elected to a three-year term as a hospital representative on the Michigan Blue Cross Board of Trustees.

John Kitchel, M.D., Grand Haven,
representing the Michigan United Conservation Clubs, was chairman of an afternoon session at the conference on "Informed Forces for Environmental Quality" held at Green Bay.

V. K. Volk, M.D., Saginaw,
was honored for more than 30 years as Saginaw County health commissioner in an informal ceremony at which his portrait and a commemorative plaque were placed in the County Health Center. He retired as health officer last year but continues as medical superintendent of Saginaw County Hospital.

Governor Names, Senate Confirms So Rice in Charge

R. Gerald Rice, M.D., who had been acting head of the Michigan Department of Public Health since the retirement of Albert E. Heustis, M.D., last October, is now in charge of the department as the director. He recently was named by Governor Romney, and the Senate then confirmed the appointment.

Doctor Rice has been associate director of the department and chief of its bureau of maternal and child health since May, 1966. He previously served two and a half years as director of the Michigan Crippled Children's Commission before that agency became part of the health department under a state government reorganization plan. A naturalized American citizen, Doctor Rice received his medical degree from McGill University in 1940 and earned an advanced degree in public health at Harvard University in 1949.

Before coming to Michigan, he had been with the Pennsylvania Health Department.

SB 1079 Sent to Governor; Should Help Attract MDs

Senate Bill 1079, authorizing the Michigan Board of Basic Science Examiners to waive their test for applicants who have passed a satisfactory set of basic science examinations through the National Board of Medical Examiners, has cleared the legislative process and has been sent to the Governor for signature. The bill, if signed, will take effect immediately.

Waiver of basic science examinations can also be granted to osteopathic or chiropractic applicants for Michigan license, if the Basic Science Board feels that the National Boards of these two groups are equivalent to the Michigan Basic Science examination.

SB 1079 has been supported by the Michigan State Medical Society, the Michigan Department of Licensing and Regulation, the Board of Registration in Medicine, and the osteopathic spokesmen. The bill's passage should at least partially remove the artificial hurdle to physician recruitment created by the basic science examination requirement.

A SECOND LEGISLATIVE proposal to completely repeal the Michigan Basic Science Act, however, has again failed to pass.

A NEW MICHIGAN STATUTE for the purpose of licensing clinical laboratories was moved closer to passage on April 30, when the Senate Health, Social Services and Retirement Committee recommended the measure to the Senate for passage.

HB 2378, drafted with major assistance from the Michigan State Medical Society, survived scrutiny in the two committees of the House of Representatives and was passed by that body in early March. At the time of this publication the bill faces only one remaining hurdle, final Senate approval, before being submitted to the Governor.

HEAVILY SUPPORTED BY MSMS, both Senate Bill 925 and Senate Bill 416 have completed the legislative process and been sent to the Governor. This pair of bills makes possible modernization of the State's school code provisions regarding the teaching of "family living" (sex education). SB 925 was chiefly sponsored by the Michigan Youth Commission, which drew upon medical experts in its deliberations; SB 416 was introduced by Sen. Roger Craig (D-Dearborn) and endorsed as a desirable companion to round out the provisions of the Youth's Commission bill.

Blue Shield Describes Variable Fee Program

BY MICHIGAN BLUE SHIELD

Michigan Blue Shield recently explained details of its new "Michigan Variable Fee" (MVF) programs, designed to broaden existing health care protection benefits for its 4,325,000 members, more than half the population of the State.

The new programs offer "the finest medical-surgical cost protection available anywhere," John C. McCabe, Michigan Blue Shield president, said, "and come as close to the ideal of total financial health coverage as we can within practical realities."

Mr. McCabe said the new programs will, in general:

1. Provide for a more realistic and up-to-date payment method which eliminates present fixed payment schedules which are tied to subscribers' income, with one designed to pay physicians reasonable and customary fees, which traditionally have varied by locality, the nature of the services and the training and experience of the physician. There is no income differential.

O-RAMA
FOR THE UNITED FOUNDATION
UNITED HEALTH ORGANIZATION
H TESTS
HEALTH-O-RAM

Official starter for the Health-O-Rama (co-sponsored by MSMS) held at Northland recently was eight-year-old Denise McDonald, of Madison Heights. Typical of the many who helped through Torch Drive health agencies, Denise was joined by local medical dignitaries, community leaders, and United Foundation representatives at a ribbon-cutting ceremony. The Health Careers Mobile was one of the featured exhibits.

2. Provide new benefits and include others which were previously available only at extra cost under M-75, Blue Shield's previous "standard" protection.

3. Strike out various medical "exclusions" which have been traditional in health care coverage in Blue Shield and commercial carriers. Mr. McCabe indicated that the new MVF programs, while having similar payment mechanisms, will be available in several forms, with different benefit scope to meet differences in group and subscriber needs.

More than 1,700,000 subscribers, most of whom are covered by collective bargaining agreements negotiated between the automotive industry and United Auto Workers Union, negotiated last fall, will receive the new program this October. Drug benefits under the new prescription drug program will be effective in the auto industry in the fall of 1969.

Some 97,000 subscribers, primarily in the steel and rubber industries, have already been enrolled in separately negotiated forms of the variable fee program.

Certain new benefits, however, will be added to all of the new MVF programs. These include unlimited medical care in the hospital in most instances; radiation therapy for benign as well as malignant conditions; unlimited medical consultations in the hospital; more liberal cosmetic surgery and other surgical benefits such as sterilization, when medically necessary, and care by more than one physician in a hospitalized case, when medically necessary.

Benjamin Jeffries, M.D., right, receives from Robert F. Diefenbach, Detroit, newly-elected president of the Michigan Epilepsy Center and Association, a Certicate of Meritorious Community Service. Doctor Jeffries had five years as MEC-A president.

Mr. McCabe said that while many of the contractual limits have been removed from the programs, coverage benefits will only be provided for services which are medically necessary within acceptable standards of medical practice.

Of special significance, Mr. McCabe said, is the fact that, for the first time, benefits for home and office medical care will be provided, on an optional basis, offering a less costly alternate to hospitalization.

McCabe also announced that a prescription drug program, jointly underwritten by Blue Shield and Blue Cross, its sister corporation, is in the final stages of development and will broaden protection "to an even greater extent."

All groups and all holders of individual certificates will receive direct notification of transfer dates as well as specific benefit provisions.

McCabe said that there will be an eventual cost adjustment which will depend upon claims experience and, therefore, no overall estimate of its amount is now possible.

Supreme Court Says Staff Wrong To Cut Privileges

(The following item is from the AMA CITATION publication compiled by the AMA Legal Staff)

The reduction of a physician's staff privileges by the executive committee of a public hospital was invalid, the Michigan Supreme Court ruled. The bylaw under which the committee acted violated due process, because it attempted to confer arbitrary power on the committee with respect to the reduction of staff privileges. The bylaw provided that the committee could reduce a physician's staff privileges if, in its opinion, it appeared that the reduction would be "to the best interest of the hospital and its patients."

The committee notified the physician that it had concluded that his handling of a certain case had been inadequate, inappropriate, and improper, and prohibited him from using narcotic drugs beyond 48 hours without the written approval of the department chief.

The physician's license to practice in the state included the right to practice in public hospitals, the court pointed out. Due process required the committee to act on the basis of reasonable standards in restricting his staff privileges. Since the bylaw contained no requirements as to the physician's knowledge, skill, character or conduct, it attempted to confer on the committee the arbitrary power to reduce privileges according to its whim or caprice, subject only to appeal to the staff and ultimately to the board, whose powers of review were equally arbitrary.

After the physician filed this suit, the list of staff appointments for the following year was announced. The physician was not reappointed. The trial court denied his motion to amend his complaint so as to raise the issue of the validity of the failure to reappoint him. That issue remains to be disposed of.—*Milford* v. *People's Community Hospital Authority*, 155 N.W.2d 835 (Mich., Feb. 9, 1968)

The decision of the intermediate appellate court was reported in THE CITATION, Vol. 14, No. 3, p. 42.

HARMON

TREMAIN

Harmon to Join MDPH; Cross Names Tremain

Effective June 1, Edwin L. Harmon, M.D., will retire as Michigan Blue Cross medical director and join the Michigan Department of Public Health as consultant to the Bureau of Medical Services.

R. Gerald Rice, M.D., Director of the Department of Public Health declares, "We're fortunate this nationally-renowned health care expert is available to us as a consultant. Doctor Harmon is remarkably equipped to help delineate the standards for services in hospitals."

Harold L. Tremain, M.D., assistant medical director at Michigan Hospital Service, will be promoted to fill the Blue Cross vacancy. His assistant will be M. J. Armstrong, M.D., Birmingham, who joined Blue Cross in April.

U-M NAMES LAPIDES TO HEAD UROLOGY

Jack Lapides, M.D., professor of surgery, has been appointed head of the section of urology in the Department of Surgery, University of Michigan Medical School.

Doctor Lapides was graduated from the U-M Medical School in 1941 and stayed for his internship and residency. He has been a member of the faculty since 1948.

Appoint Moses New Editor

John W. Moses, M.D., Detroit, began duties May 1 as the new Scientific Editor of *Michigan Medicine.*

He was elected by The MSMS Council at its April meeting, upon the recommendation of the Publication Committee, to fill the vacancy created by the resignation of George H. Lowrey, M.D., of Ann Arbor.

Doctor Moses, who is director of medical education of Mt. Carmel Hospital, is active in the Wayne County Medical Society and is a delegate to the MSMS House of Delegates.

The Council praised Doctor Lowrey for his fine service. He became Scientific Editor in April, 1966.

(Further details will appear in the June issue.)

Health Congress Soon in U.P.

The Third Annual Upper Michigan Health Congress will be held at Houghton, May 22-23, sponsored by the Michigan Health Council, Technological University, Michigan State Medical Society, Michigan Foundation for Medical and Health Education, and nearly 100 other member organizations of the Council.

A highlight will be the Michigan Week banquet at Michigan Tech, May 22 with Win Schuler, Marshall, General Chairman of the 1968 Michigan Week, as banquet chairman; Hugh W. Brenneman, MSMS Executive Director, as toastmaster; and Bennett J. McCarthy, Vice-President of Michigan Hospital Service, as speaker. The Michigan Blue Cross-Blue Shield will sponsor the banquet, featuring coho salmon.

"All science begins and ends with medicine" is the line in a Health Careers Mobile exhibit that holds the attention of two Detroit teenagers. The poster is part of the University of Michigan Medical School exhibit. The Health Careers Mobile has been at the Detroit inner-city high schools and now is looping around the state, under the active sponsorship of the Michigan Health Council and MSMS, to interest young people in possible Careers in the Medical field.

ADD: IN MEMORIAM

In addition to the names reported in the May "In Memoriam" the following news has reached the MSMS office. Details will follow in the June *Michigan Medicine*:

Van D. Barnes, M.D., Livonia, died April 7.

John R. McBride, M.D., Lapeer, died March 28.

ON AMA PROGRAM

Paul W. Gikas, M.D., and Melvin Selzer, M.D., both of Ann Arbor, will speak at an AMA session on Auto Accident Injuries during the 117th Annual Convention June 16-20 in San Francisco.

Wayne Installs Danforth; Fryfogle President-Elect

"I hereby pledge to wear its mantle with dignity and dedicate myself to support traditional ideals flexibly enough to progress wisely, to strive for unity of thought and purpose, to provide sanctuary of counsel to all in need, and to perpetuate the image of trust to the community we serve," said James C. Danforth, Jr., M.D., upon taking office as president of the Wayne County Medical Society during its annual meeting May 6.

Michigan Medicine will carry the full text of Doctor Danforth's inaugural address in a future issue.

James D. Fryfogle, M.D., was announced as president-elect during the meeting.

George L. Reno, M.D., took over as the new secretary.

Immediate Past President Frank B. Bicknell, M.D., was elected to a five-year term as trustee, and Brock E. Brush, M.D., and Ralph R. Cooper, M.D., were re-elected as trustees.

There will be several new faces on the Council of WCMS during the coming year. Louis R. Zako, M.D., was elected as secretary to the General Practice Section; Donald I. Bryan, M.D., new secretary to the Medical Section; and Raymond J. Barrett, M.D., new secretary of the Surgical Section. Returning to the Council are Leon Rottenberg, M.D., (chairman, General Practice Section), Fred W. Whitehouse, M.D., (chairman, Medical Section), and William J. Yott, M.D., (chairman, Surgical Section).

Other new members of the Council are Clayton M. Shors, M.D., Gerald H. Mandell, M.D., Frederick Weissman, M.D., and Richard L. Lamont, M.D., all of whom are serving as Geographical Representatives.

FOUR MD GRADS HONORED BY WSU

Four WSU alumni received the coveted Distinguished Service Citations at the WSU School of Medicine Reunion May 15. They are all professors and chairmen of departments of their respective medical schools, They are Fred Harbert, M.D., otolaryngology, Jefferson Medical College; Jules H. Masserman, M.D., psychiatry, Northwestern University School of Medicine; Edwin T. Nishimuru, M.D., pathology, University of Hawaii School of Medicine; and Peter J. Talso, M.D., medicine, Loyola-Stritch School of Medicine.

These physicians were honored for "distinguishing themselves, their school and their university."

A special Centennial Award was presented to Duncan J. McColl, M.D., of Port Huron, who was born near Glachan, Ontario, November 24, 1868, the year of the University's founding. Doctor McColl entered the Detroit College of Medicine, a forerunner to the School of Medicine, in 1889 and graduated in 1893.

(More details will appear in future issues of *Michigan Medicine*.)

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

PARKE-DAVIS 015R67

LACTINEX®

TABLETS & GRANULES

- **to help restore and stabilize the intestinal flora**
- **for fever blisters and canker sores of herpetic origin**

LACTINEX contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

First introduced to help restore the flora of the intestinal tract in infants and adults,[1,2,3,4] LACTINEX has also been shown to be useful in the treatment of fever blisters and canker sores of herpetic origin.[5,6,7,8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

b.i.d.

If your objective in the use of a broad-spectrum antibiotic is prolonged action, with high blood levels, consider DECLOMYCIN 300 mg b.i.d.

The maintenance dosage of DECLOMYCIN 300 mg can be kept at this convenient schedule because of its unusually high effective blood and tissue levels.

In clinical practice, blood levels produced by a therapeutic dose of DECLOMYCIN are high, prolonged, and effective, because of high serum binding and slow renal clearance.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle

Prescribing information on next page.

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE
b.i.d.

DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines when the offending organisms are tetracycline-sensitive.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should. avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects—Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

In the treatment of syphilis a dosage schedule of a total of 12 to 18 Gm given in equally divided doses over a period of 10 to 15 days should be followed. Close follow-up observation of the patient is recommended, including appropriate laboratory tests, since demethylchlortetracycline has not had adequate evaluation in all stages of syphilis. Spinal fluid examination should be included as part of this follow-up.

Acute gonococcal anterior urethritis in males has been treated effectively with a single dose of 600-900 mg of DECLOMYCIN Demethylchlortetracycline. Individuals unable to tolerate large single doses due to gastrointestinal side effects may be treated with 150 mg every 6 hours for a minimum of 4 doses or 300 mg every 12 hours for a minimum of 2 doses. Females should be treated with a dosage of 150 mg every 6 hours or 300 mg every 12 hours until a cure is effected.

Primary Atypical Pneumonia (Eaton Agent): The average adult daily dosage is 900 mg in 3 divided doses for six days.

BY BRADLEY M. HARRIS, M.D.

MSMS PRESIDENT'S MESSAGE

About Our Image . . .

How important is image?

Image is important it seems to me if doctors are really concerned about the opinions of their patients, about the comments of editors and educators, and about the attitudes voiced by legislators and other professionals.

Image is important as doctors perform well, obtain respect, and achieve economic security and self fulfillment.

* * *

You might ask, "what do you mean by image?"

There is a simple definition: Image is a mental-emotional picture held by our many publics in health, government, education, communications, etc.

These impressions of doctors are gained every day, every hour in so many ways.

* * *

Can the image be changed?

Certainly. And the impressions are changed almost every hour for the better . . . or the worse.

May I be so bold as to write about some of the factors that effect your image — so you might be able to evaluate your weak points and build upon your strengths?

Our image, I believe, relates to . . .

A man's knowledge, his professional abilities, his management skills, his ability to budget his time;

A person's appearance, voice, handshake, eyes, smile;

A doctor's civic contributions, business practices, family relationships;

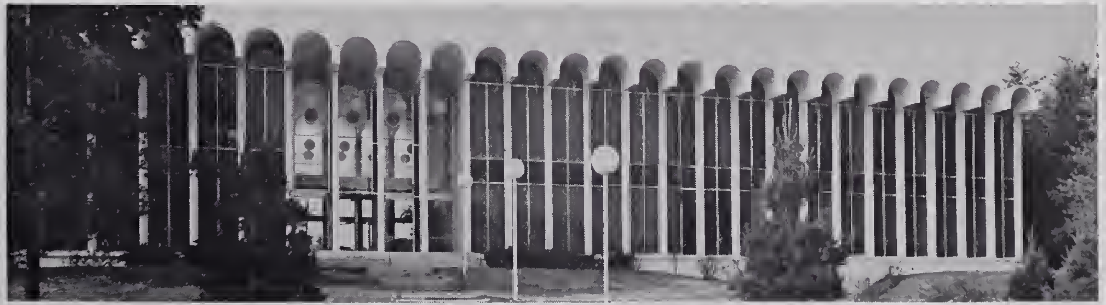
A physician's patience, tact, manners, cordiality;

A person's dedication to continuing education, to ethics, to his nation.

These comments have been aimed at every physician as an individual. I firmly believe that each of us can improve our personal image if we continue to improve our professional performance, if we fulfill our role as a citizen, and if we respect the members of our family.

* * *

As a former chairman of the MSMS Publication Committee, I would like personally to thank George H. Lowrey, M.D., for his outstanding service as Scientific Editor of Michigan Medicine since April, 1966. And at the same time, I wish John W. Moses, M.D., the new Scientific Editor, the best as he succeeds Doctor Lowrey. MSMS indeed has been fortunate to have such men in recent years as Wilfred Haughey, M.D., C. J. Tupper, M.D., George H. Lowrey, M.D., and now John W. Moses, M.D., as dedicated editors to provide the members with the best of timely, vital scientific articles.



MICHIGAN STATE MEDICAL SOCIETY, 120 W. SAGINAW, EAST LANSING, MICHIGAN 48823

Butazolidin® alka
in rheumatoid arthritis.
If it doesn't work in a week,
forget it.

But don't forget this about Butazolidin alka

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of Butazolidin alka are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Agranulocytosis can occur suddenly in spite of regular, repeated normal white counts. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angiitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

**For complete details,
please see full
Prescribing Information.**

Dosage in Rheumatoid Arthritis: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily.

In selecting appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response. (B)46-070-A

Obstructions and Pitfalls In Implementing the "New Physician"

BY RICHARD M. MAGRAW, M.D.
WASHINGTON, D.C.

The word "pitfall" implies a hidden and not easily recognized danger or difficulty when, in fact, there are plenty of obvious and recognizable obstructions which block our way and impede our progress toward "the new physician." Moreover the term "pitfall" suggests an unforeseen interruption in a program already underway, implying that we are farther along in this effort than we are.

In this project we are still struggling with obvious blocks to attain the goal. To draw an analogy from a childrens' Christmas story, "The Little Engine That Could," we are yet on the uphill track of "I think I can, I think I can" rather than having attained the downhill version of "I thought I could, I thought I could."

This distinction is made to emphasize what has been and continues to be the chief block to the implementation of the new physician concept, namely, our confusion as a profession about realities of our time. In part, because we have been too busy practicing and providing care, we have not understood the enormous changes in our time, and we have consistently underestimated the complexity of the adaptations which are demanded of us. We are indeed "walking backward into the future."

For example, there has been a general assumption that the task of implementing the new physician could be accomplished simply by persuading the medical schools and teaching hospitals to develop an appropriate instructional program for family practices. However, to implement the new physician, not only must medical education (undergraduate and graduate) be restructured, but the division of labor within the traditional medical profession must be revised; the relationship and functions of the elements of the larger medical care apparatus (i.e., clinics, hospitals, and related health personnel) must be modified; arrangements for payment for medical services will need to be significantly altered; and public understanding and acceptance must be won. In each of these areas there are obstructions and pitfalls.

I. Blocks to the Development of Residency Programs within Medical Education

A. Blocks within the medical school and its associated hospitals and clinics.

Although most schools are currently modifying some of the undergraduate curricula, we will not here consider undergraduate aspects of education for this new role. The modification of undergraduate education is not absolutely essential to implementing the new physician concept.

Since most physicians have heard much about the pitfalls and obstructions of implementing this program within the medical schools, I will list them here only in an abbreviated way.

WHEN FACULTIES COME to consider establishing programs for the "new physician" in medical schools, they find they have undertaken a very large order for these reasons:

(1) In general, medical school faculty members are not knowledgeable about the medical care apparatus per se and are unaccustomed to assessing the characteristics of the practicing profession in terms of the medical needs of society. They are often so far removed from the communities' medical care needs as to be unable to make judgments regarding the training required for primary care in today's world.

(2) Medical schools, hospitals, or clinics are usually referral or charity institutions or both. As such, they have neither an established role in, nor a tradition of providing first-line comprehensive medical care. And, as they attempt to develop new and more suitable facilities for training, they expect objections from the practicing profession for intruding into primary care. Thus far, their anticipations have proven correct.

(3) There is a new division of labor implicit in the concept of the new primary physician which runs counter to the existing departmental structure as well as the associated professional

models which are strongly entrenched in medical school usages, concepts, and politics.

(4) The campaign for the new physician developed in relation to implied or expressed threats to the research enterprise, which is the preponderant force in today's medical school.

(5) The traditional medical school has evolved into a medical research and graduate training center. The medical education part of this enterprise (as opposed to the research portion) is not able to undertake a new training program without major additional financial support.

(6) It is very nearly impossible for any one school by itself to undertake the required major revision of either graduate or undergraduate training. Hence, a cooperative effort is necessary. Further, it is difficult for medical educators, even as a group, to undertake to produce a "new physician," (including a new role) unless the institutions and arrangements of medicine and society are also changing to provide a place for him.

In addition to lacking the incentive to implement this program, academic medicine has a conservatism of its own, which, in this matter, appears to be about as intransigent as that of the practicing profession.

B. Obstructions within the teaching hospitals (public or private) not affiliated with medical schools.

At the present time some of the most promising starts toward implementing the new physician are occurring in these hospitals, particularly the private ones.

City and county hospitals (charity hospitals) are having difficulty with the concept. Their major problem appears to be that the medical care provided the patients by such hospital staffs has been far from comprehensive. Regardless of the quality of in-hospital care given, the overall care usually has been fragmentary because of the hospital ward and categorical orientation situations. Outpatient care has been poor in quality, and concepts of community health needs have been limited to calculating bed capacity and comparing the technological sophistication of the particular hospital with similar institutions.

Private hospitals are in a stronger position, for implementing the training for the new position, for doctors on their staffs provide primary care, paradoxically, because their work is oriented much more toward their offices and the community than to the institution. However, the private hospital, to a greater or lesser extent, has a recognized position of trusteeship for the medical resources of the community, thanks to Hill-Burton regional hospital planning, etc.

THE MOST ESSENTIAL new elements for education of the personal physician are the demonstration of: (1) the managerial responsibility of the individual personal physician, and (2) the linkage between such responsibility and the cooperative enterprises of medicine as in the hospital and its medical staff. At present the private hospital-medical staff combination offers the only existing demonstration of this, although the models are far from being adequate for instruction of tomorrow's physician.

II. Blocks within the Practicing Profession

The obstructions within the practicing profession are not fully separable from those within the medical schools and teaching hospitals. They all derive from a tendency among some doctors to see this as a circumscribed issue involving, fundamentally, the general practitioners. This is opposed to seeing the issue as a general restructuring and rationalization of medical care or as understanding the need for such restructuring.

Now the chief overt opposition to this concept comes from some groups of internists and pediatricians and, to a considerably lesser extent, from obstetricians and general surgeons. Not surprisingly, the publications of the Millis and Willard reports, as well as the other reports and publications which have supported the concept, have resulted in a crystallization of opposition to the "new primary physician" concept within the groups who feel threatened.

PEDIATRICIANS AND INTERNISTS have objected to this concept because they sensed in it a contrived revival of the surgically oriented and, in their view, inadequately trained general practitioner and have perhaps felt it an implied criticism or undermining of their role.

In general they have perceived this as a threat, rather than an opportunity for evaluation of their own role. Editorials in some journals this past year, while acknowledging that there are now different kinds of internists and pediatricians which may require different training, tend to see these as variations within the disciplines of pediatrics and internal medicine rather than as a small-scale replica of the generalist-specialist problem.

As yet internists and pediatricians seem little aware that in the long run not only the interests of the American public, but the self-interest of all personal or family physicians, regardless of professional label or type of training, will be best served by defining this function and improving it by training. At the bottom of this problem are two cherished misconceptions: First, internists and pediatricians are retaining an outdated concept of their role and training as general specialists. It is becoming clear to all that these general specialists have already been divided by their work into two broad groups—those that preponderantly provide primary care and those that serve as consultants. It is, further, becoming clear that the evolving organization of medical care demands further polarization of these roles and a formalization of them.

Second—another cherished idea is that the internist or pediatrician should be trained for the consultant aspect of his work, but he needs no special training for primary care. This idea is apparent in the insistence that all internists are internists and all pediatricians are pediatricians; that is, they should all have a common training and pass a common board examination demonstrating a consultant's level of competence.

A CYNIC MIGHT remark that this incidentally assures their maintaining amateur standing in the field of primary care.

Romano, some time ago, stated that the scientist's first loyalty was to his clinical material. The "clinical material" of the internist trained on the wards of a teaching hospital is very different from that involved in the patient care he will provide as a primary physician. He has not yet resolved the issue as to what "clinical material" he will give his loyalty.

Not the least of the problems of implementing of the new physician concept within the medical profession itself is the political power and vested interest of existing specialty boards. These boards have performed valuable functions for society by elevating professional standards. However, their orientation in medical care has always been limited to the specialty. They have eschewed any assessment of overall medical care or unmet community needs. Each specialty board has concerned itself with improved professional functions in the specialty, usually by making progressively more demanding measurements of expertise.

Taken together these forces within the medical profession seriously impede development of educational programs and recruitment for the new professional model.

III. Blocks in the larger apparatus of medical care and health; e.g., clinics, the hospitals, and related health professions

As noted earlier some of the most promising beginnings in graduate training programs for the new physician are being made in private hospi-

AUTHOR

Doctor Magraw is the new director for extramural relations of the Public Health Service's bureau of health services in Washington. He formerly was professor of psychiatry and neurology, and of internal medicine at the University of Minnesota Medical School.

tals. There are, however, some important pitfalls involved.

IN WHAT MIGHT BE described as the "hospital view of medical care," the hospital rather than the primary physician is seen as the center of medical care. This is apparent in the recommendations made by various governmental and quasi-public commissions concerned with meeting the medical needs of society. They recommend that hospitals* should serve as the center of care for all patients and that they should specifically manage the personal medical care and provide referral services for all persons who do not have personal physicians.

Owing to the seriousness of the need, the shortage of physicians, and the lack of either a consensus in, or a forward looking alternative from, the medical profession, this hospital-center idea has considerable appeal. This idea is also widespread among hospital administrators and planners in medical care. It is one of the obstructions of implementing the new physician since it implicitly denies the need for his function. It suggests that we do not really need any professionally trained person to carry out this function, at least for the persons who have now been given medical purchasing power but do not have personal doctors. It becomes all the more important when we understand the weight which this view is likely to receive politically and recognize that hospitals heretofore have characteristically looked inward and oriented themselves to a concept of care of episodic disease rather than comprehensive continuing care. Thus, in many ways the hospital portion of medical care is conceptually the natural antitheses to the part of comprehensive personal care which is the basic function of the new physician.

IV. Blocks in medical economics and the payment for medical care

In my view the most important obstructions to implementing the new physician concept are in the economics of medical care and specifically in remuneration for services. Although the history of this is long and complicated, the problem itself can be simply stated. Comprehensive personal medical care has seldom been explicitly recompensed. In general it's been a "loss leader" or a "give away item" at the medical market place. Schedules of benefits of third parties are endlessly detailed and explicit in regard to technical procedures. Only vaguely and implicitly, if at all, however, do these schedules acknowledge that there is a wider element of skill and time required for comprehensive care of the patient than for obvious procedures of medicine. There is probably nothing which could be done in medical training or in the organization of medical care which would as quickly implement the concept of the new physician and correspondingly rationalize our entire system of medical care as developing a realistic remuneration for the managerial and integrating services of the primary physician. It is hard to do this on a fee basis. How can he be paid for studying the consultation report or for all the other things involved in integrating a patient's care or preventive maintenance?

IN MY OPINION there is no more practical way of doing this than establishing, in addition to existing fees for service, some modest "retainer

AMA Ad Hoc Report On "New Physician" Available from MSMS

Thoughts about "the new physician" were advanced in the Report of the AMA Ad Hoc Committee on "Education for Family Practice," published by the AMA. William R. Willard, M.D., vice-president and dean of the University of Kentucky Medical School and chairman of the Ad Hoc Committee, spoke at the 1967 MSMS Annual Session and was followed by Doctor Magraw. The Report was studied in detail this past year by the MSMS Education Liaison Committee. Interested MSMS members may obtain a copy of the Ad Hoc Committee report by writing to MSMS, 120 West Saginaw, East Lansing 48823.

---

*In order to avoid false issues it is important to understand that many people use the term "hospital" here in a broadly encompassing way meaning the medical care apparatus of society with the physician at its core. "Medical center" or "health center" would probably be a preferable term, but the idea of hospital has both high visibility and loyal constituency.

fee" or "availability fee" paid annually by each patient (or on his behalf by a third party carrier) to the doctor who assumes ongoing medical responsibility for him.

Devising some way of realistically paying for comprehensive personal care would probably brush away all existing obstacles in the path of the implementation of the primary physician. It would define, in the public mind, the professional role which has become all but invisible under current medical care and medical pay arrangements. It would, similarly, define in professional thinking the function which some doctors still regard as an attempt to give to "airy nothing a local habitation and a name." Payment gives it substance. In this regard it's well to recall the bitter struggles which occurred within the last few years over the issue of surgical privileges in hospitals for general practitioners. These struggles were not wholly or even primarily economic. They grew out of the general practitioner's difficulty in defining a professional role for himself or maintaining a professional identity in other terms than surgical expertise. Surgery was what he got paid for, and it was correspondingly in surgical terms that he defined his function and measured his professional identity.

The personal physician's situation regarding pay for comprehensive personal care is analagous to that of the free lunch in the days of the saloon when the lunch was supplied to help sell the beer which made the profit. By analogy, the beer is the technical part of medicine that third parties pay for. When the beer was separated from free lunch (that is the surgery was separated from the comprehensive personal care), not only was the doctor's livelihood affected, his professional identity was diluted and threatened.

V. Blocks in public understanding and acceptance

Perhaps the biggest block to public understanding and acceptance of the new physician is a psychological one wherein the individual members of society, particularly at a time when they are not sick or active patients, maintain the fiction that illness or disease is an alien external thing which can be dealt with, removed, or cast off without involving them personally.

The potential dependence on another person, the lessened interpersonal distance, and the trust required all are a little frightening and will be avoided like "flouridation" unless their usefulness is understood.

At present the implementation of the primary physician may still be largely in professional hands, but soon and in any event, ultimately this will be a social or political decision. This professional role concerns all doctors, not only general practitioners, internists, and pediatricians, as it will bring to pass a long overdue and adaptive division of labor.

SUCCESSFUL IMPLEMENTATION of this new physician is of importance to all Americans as it will provide integration at the interface between the individual patient and an increasingly complex technology and apparatus of medicine.

Failure to bring this about is almost certain to cost us part of what we value the most, the human content of our lives.

Clinical Response to Iron-Polysaccharide Complex In Geriatric Patients With Iron-Deficiency Anemia

ABSTRACT — The geriatric patient often offers so many problems that iron-deficiency anemia is frequently neither suspected nor investigated. This article indicates that simple therapy with an oral preparation results in a prompt response in most older patients.

BY JACK F. SANDERS, M.D.

ALMA

Physicians have been offered many types of iron preparations, including ferrous sulfate, gluconate, and fumarate. Although they produce the desired hemoglobin responses, these forms of iron have been reported to irritate the gastrointestinal tract.[1,2,4] Adverse effects accompanying the administration of these agents (e.g., nausea, diarrhea, anorexia, constipation, abdominal cramps) are sufficient in some cases to interrupt their use.

When iron in the form of a polysaccharide complex was found to be less toxic to mice than the standard ionized forms, its possible clinical applications were investigated. In this form, the elemental iron is supposedly bound in complex until dissociated by hydrochloric acid in the stomach; it is absorbed in the duodenum and jejunum, where iron absorption is maximal. Children receiving non-ionizable iron have been reported to respond well, with good hemoglobin response time, and no clinically significant adverse affects. In geriatric patients whose chronic diseases may render them less responsive and more sensitive to irritating therapeutics, such a non-toxic form of iron would be desirable.

To further test the acceptability of this water-soluble hematinic,* the present study was conducted in geriatric patients with iron deficiency anemia.

Method and Material

Participants in this study were selected from residents of the Michigan Masonic Home and Hospital, a uniform socio-economic group with a mean age of 84. Of 392 screened with CBC's with peripheral smears and stools for blood, only 20 had iron deficiency anemia requiring treatment (i.e. hemoglobins below 12.0 grams, average 10.7 grams, and hypochromic morphology). They ranged in age from 78 to 95. Diagnostic upper GI and colon examinations were also performed in 80 of the possible candidates. Of these, 3 were found to have colon malignancies and were successfully operated before signs or symptoms had become manifest; they were not included in the study. Carcinoma of the caecum was discovered in 1 patient and successfully operated after the initiation of iron therapy. Eight patients showed trace to + blood in the stool without identifiable source. Multiple chronic diseases which might interfere with the response were present in every patient. Cardiovascular renal diseases complicated the conditions of 16 patients; 4 men had prostatism; 2 women chronic glomerulonephritis.

Patients ate a 1.0 Gram salt diet at special diet tables. The stable living pattern was interrupted in only 1 patient who was removed to another hospital for surgery.

Each patient received polysaccharide iron complex in elixir form, one teaspoonful bid for a total daily dose of 200 milligrams of elemental iron. Nurses administered all medications. Subjective evaluations of the palatability and acceptability of the elixir were offered by the patients.

Prior to therapy, CBC's including reticulocyte counts, hemoglobin and hematocrit values, BUN's, urinalyses, and Diagnex Blue tests were done. Because the time for response to iron therapy in geriatric patients was not known, treatment was continued for 12 weeks and repeated testing was done at 2 week intervals during treatment and at 1 month and 6 months after its termination. One technologist performed all the tests.

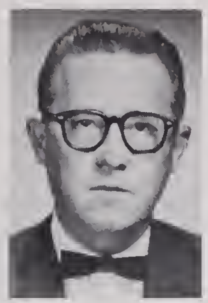
Results and Discussion

During the first 28 days hemoglobin values rose in 15 of 19* patients with an average increase of 1.5 grams, and with corresponding hematocrit increases of 2.33 vols.%. The 5 non-responders all had severe cardiovascular renal disease and chronic blood loss in the stool. Only 1 of the responders had blood in the stool. Two of the responders had no free gastric hydrochloric acid and 9 had only a

---

*Niferex, oral iron polysaccharide complex marketed by Central Pharmacal, Seymour, Indiana.

*1 of the 20 patients died of unassociated causes too early in this study to be included.



THE AUTHOR

Doctor Sanders is medical director for the Michigan Masonic Home and Hospital at Alma.

trace as indicated by the Diagnex Blue test. Reticulocyte counts showed no apparent relationship to response or lack of it.

Six months after the 12 weeks of administration of iron polysaccharide complex, 4 of the 15 responders had dropped back to their original hemoglobin levels, with no evidence of blood loss. The 4 non-responders were all lower at the end of the study than initially despite the iron intake.

One patient complained that he "just didn't like" the medication. One complained of momentary flushing and another of transistory stomach distress for a few minutes after each dose; the complaint was not serious enough in either to require alternation of therapy. All patients wore dentures; there were no denture stains.

Conclusion

Simple iron deficiency anemia in a geriatric population on a well controlled pablum is less prevalent than commonly supposed, only about 1 in 20. Non-ionizable polysaccharide iron was effective in 15 of 19 such patients, and was well accepted and well tolerated in all 19. An arbitrary dosage of 200 milligrams of elemental iron per day produced clinical responses within the first 28 days of therapy. None of the patients had any significant gastrointestinal irritation or any sign of toxicity. The coexistence of multiple chronic diseases did not interfere with response, with the exception of cardiovascular renal disease with elevated BUN's and chronic blood loss. Total absence of free gastric hydrochloric acid or only trace amounts as indicated by Diagnex Blue testing did not interfere with iron absorption and hemoglobin response.

These preliminary studies warrant further investigation in depth and with controls of this type of iron therapy.

Early Strategies in the Treatment Of the Anxious Patient

ABSTRACT—Anxiety is a "fear syndrome," expressing a patient's reaction to a life situation which he perceives as dangerous. When the physician gains some insight into the nature of the patient's fear, and communicates this understanding to him, within the framework of a friendly doctor-patient relationship, the condition is apt to improve.

BY JOSE' J. LLINAS, M.D.
LANSING

All of us have lived through times of anxiety and tension. Moments of dreadful anguish, torturing expectations that something terrible is about to happen, and that we are powerless to prevent it, are a universal experience.

Anxiety becomes of concern to the physician, however, only when it is so constant or so severe that it interferes with the patient's enjoyment of life, his relationship to others or his ability to work.

Definition

Anxiety is a disagreeable, unpleasant feeling, which patients describe in a variety of ways, since it has both subjective and objective physiological components. They are "nervous," "apprehensive," "worried," "insecure," "shook-up." They have misgivings about their state of health, and the soundness of their minds. They complain of head pressure, pain in the chest, palpitation, nausea, chills, fever, cold hands, sweating, agitation, restlessness, insomnia. . . .

They are scared, and show the signs and symptoms of fear; though they can't exactly tell what terrifies them.

There is a wide spectrum of clinical pictures, from the mildly apprehensive patient who worries a little more than he should, to the one in an acute panic reaction, who is convinced there is something terribly wrong with him.

Understanding Anxiety

A syndrome so common and ever present, must fulfill a definite role in human affairs. There are a number of explanatory theories, of which the psychoanalytic one is the most comprehensive.[1,2,3,4]

Like fear, to which it is related, anxiety seems to have a protective function. Just as fear helps with physical survival, anxiety helps in the world of interpersonal relations towards what we may describe as *emotional survival*: the ability to gain acceptance from others.

Reaction to Danger

Like fear, anxiety is a primary reaction to danger. Fear refers usually to a danger without, clearly visible to others; anxiety refers to an internal danger. Like the Trojan Horse, the anxiety attack is an assault from within.

Conflict of Emotions

Internal danger means of course, that there is strife within the person.

As a human being grows and develops, he has to acquire not only control of external circumstances, but also mastery of himself.

Most of the problems the child faces can be reduced to ways and means of integrating his own self-centered needs with those of his environment. There is always conflict between the child's egoistic love of himself, and his more altruistic love of others. It is only because the child wants the support and affection of his parents more than he desires his constant comfort, that he is able to divest himself of some of his more self-centered strivings.

Of the two forces the parents use for educating the child, love is, of course, the most important; but fear always plays a fundamental part. Both are involved in creating unendurable distress if the child does not respond by making progress along his developmental path. As one looks back, superseded and forgotten conflicts are strewn along the way, as so many discarded old cocoons.

In the process, several types of fear can be distinguished, from the earlier and more primitive, to the older and more socially sophisticated:

(1) fear of losing the parent, and parental physical care ("dependency")

(2) fear of losing the parent's love

(3) fear of being punished for one's fantasies

of an aggressive or erotic nature, involving the parents (the punishment imagined as some sort of retaliatory deprivation or damage)

(4) fear of losing self-esteem (self and social approval)

These anxieties go from a highly *personal* concern about physical bodily needs to a highly *interpersonal* fear of disapproval.

Has a mature human being overcome all of these fears? The normal person when undergoing stress, and the anxious patient all the time, they both manifest a good many facets of these developmental anxieties.

A Clinical Example

A demonstrative vignette may help make our discussion more meaningful at this point.

A 40-year-old woman, a clerical employee at the admitting office of a small hospital, was referred for psychiatric evaluation because of constant fears of a heart attack. She had been admitted to the hospital on several occasions with complaints of palpitations, intense fear, restlessness and mild chest pain.

When reassured by the doctor's examination that there was no apparent organic disease, she would calm down some, but continued to worry. Her fear then was that there might be something wrong with her which the doctor was not as yet able to detect.

Asked about her present life situation, she claimed to be happily married, and said there were no difficulties of any kind in her life. She was unable to recall exactly when and under what circumstances her apprehension had started.

Throughout a series of interviews, she was finally able to remember that the anxiety attacks had begun six months previously, on one occasion when she was in the process of helping to admit a patient. What kind of a patient? A middle aged obnoxious alcoholic man, who became very boisterous and difficult to manage. "I was revolted by his behavior, his obscene talk and his fighting." She was so mad and started shaking so badly, that she was forced to leave the room.

A brief exploration of where such intense feelings could come from disclosed the picture of a very harsh and bitter childhood at the hanls of an irresponsible alcoholic stepfather, of whom the patient's mother was dreadfully afraid. There was also a suspicion that her husband, whom she had married because he seemed so reliable, had apparently formed an extramarital liaison.

This summary allows us to review a number of typical features in the average anxious patient.

Precipitating Event

There is usually a precipitating event or situation in the patient's *present* environment, which triggers the anxiety attack. Also very typically, the patient at first denies such an occurrence. In part, she is not really aware of the problem; in part, she is trying to protect herself from having to discuss with the physician intimate details of her life, which she considers embarrassing or painful.

One should never underestimate people's capacity for self deception. To kindly insist that there must be a recent cause for the disturbance, as the doctor knows from his long experience with this type of problem, is in the best interest of the patient.

It may be misleading to always think of clear cut, highly dramatic incidents. To be sure, this is many times the case; but long term common, disturbing family situations, form always the unavoidable background.

In the patient mentioned above, the fact that the husband was apparently running around was a clear indication that not all was well with the marital relationship. Her inane statements about the good state of her marriage obviously covered up a very intense fear of being abandoned by him, and a good deal of repressed rage about his behavior.

We should not be too hard on the patient's sincerity, as we all have an almost uncanny ability to deceive ourselves about the true nature of our actions.

A married woman, who lived with her aged, cantankerous and dominating mother, attributed her anxiety spells and fatigue to a lack of adrenalin in her system. Trying to convince her physician of the soundness of her explanation, she uttered this statement, "I have so very little adrenalin circulating in my veins that if somebody came in right now and told be that my mother just died, I wouldn't be able to move a muscle!"

The physician needs adequate knowledge of the sentimental intricacies of normal human relationships, to be able to understand the patient's true emotional situation. Ambivalence of feelings, the fact that most of our intimate attachments involve a mixture of sentiments (love and hate, resentment and tenderness), is a constant finding. When the relationship is threatened (separation, jealousy), the negative feelings come to the fore. This the anxious patient perceives as a serious danger.

An 18-year-old high school senior complained of inability to urinate in the presence of others at public rest rooms. This was very embarrassing to him, as he was a very shy person, to begin with, and blushed easily in situations of this sort.

A review of his family history showed his household was composed of a psychotic father, who had severe episodes of temper and depression including suicidal behavior; and a hard suffering mother, distant and aloof, but to whom the boy felt, nevertheless, intensely attached. With some encouragement, he was able to discuss his fear of going away to college, leaving his mother, as it seemed to him, in the hands of his father. The urethral inhibition in part represented his fear of attending college with boys whom he pictured as more grown up, mature and masculine than himself.

Inhibitions of this type very commonly hide a good deal of anxiety regarding adult relationships. Some anxious girls refuse to go out with boys "because I may have to go to the bathroom, and how would I explain that to my date." Looseness of the bowels is not an unusual physical symptom of fear.

I once treated a married couple who, after six months of marriage, were still unable to tolerate each other's presence in the bathroom. Not surprisingly, their main complaint was inability to have sexual relations.

Predisposition and Fears

As one takes the history, there are generally in the anxious patient, evidences of a tense, worrisome disposition, which goes back to childhood. Sensitivity to separation from mother, as for instance expressed in so called "school phobia," is not uncommonly elucidated.

School phobia, as most pediatricians know, is a misnomer for a situation in which a youngster manifests an acute fear of leaving home to attend school. Sometimes the child openly refuses to go; more often he suffers severe nausea, vomiting, stomach ache and fever. All these dramatic symptoms are quickly alleviated if he is reassured that he can stay home. If he is forced to attend school, as it is usually done when the family receives psychiatric help, he develops severe anxiety, and pleads to be returned home.

At the root of this condition there is usually a good deal of apprehension to leave the parents, particularly the mother, lest something should happen to her. Constant watching of his mother is the only recourse the youngster is left with, to reassure himself against the imagined effects of his own resentment. Families where this type of problem develops usually disapprove very strongly of any open expression of hostility.

If clear cut phobias do not appear in the history, one often finds subtle evidences of inhibition. Patients describe themselves as little boys and girls who seem to have been better behaved than average, all of the time. Such extreme fear of disap-

THE AUTHOR

proval is incompatible with a normally contented youngster, at least in our culture.

Somatic Preoccupation

Fears of a "heart attack," as the patient mentioned above suffered; "hypertension," "cancer," etc., are very common. They represent a convenient peg to hang apprehensions on; and very frequently mask fears of punishment related to fantasies of giving in to forbidden aggressive or sexual desires.

Without realizing it, the patient reproduces forgotten concepts of the time when he was a child, and was taught that if he behaved himself, nothing bad would ever happen to him; or the ideas of primitive people, who fear sickness as a punishment from the gods. This return to earlier, previously surmounted infantile modes of thought is called *regression,* and is a very striking characteristic of the anxious patient.

At times the situation is complicated by the presence of true organic disease.

A 43-year-old salesman was referred by his cardiologist because of the patient's seeming inability to accept the reasonable restrictions imposed by his coronary artery disease. The patient described himself as a highly driven man, who was used to working 12 to 14 hours a day; and for years had had little time or interest for anything else in his life. He was married to a very passive, inhibited, highly religious wife; they had two boys, and the patient was very strict with them.

There was an older brother, with whom the patient as a youngster had been very competitive. "He was so good in sports, and my parents liked him so well, you might say I lived under his shadow," the patient stated. He admitted being unreasonably angry about his heart condition, feeling that to have to slow down because of the illness was "adding insult to the injury."

He was unable to see or admit to himself that jealousy of and competition with his older brother were serious unresolved problems, despite the fact that in a second interview, he described many vicious fights with him. The brother was older and stronger, and "used to hit me right here, where I now get the pain."

Principles of Early Management

The anxious patient is caught in the throes of an emotional conflict within himself, which he does not understand and of which he is not even clearly aware. The anxious attack has been precipitated by an emotionally charged incident or situation, but the patient has usually "forgotten" the incident, and is leary of discussing it. There are evidences of childhood fears or apprehensions, and a good deal of somatic preoccupation. The patient is more willing to discuss symptoms, than he is life circumstances connected with them.

The Physician's Reaction

The doctor's initial response to the anxious patient determines to a large extent whether the patient will be helped or not. The patient is scared, and in a state of crisis, but the situation of danger the patient fears so much is usually not as grave and serious as he assumes.

The fear has to be accepted and understood, remembering the simplified list of developmental apprehensions listed above. The patient is a bona fide sufferer, a legitimate medical patient, and there is no point in minimizing his preoccupations.

A very common pitfall is to try to reassure too much and in too general a way. A psychiatrist of vast experience, Professor Raymond Waggoner, pointed out recently a not unusual happening between physician and nervous patient.

The patient himself may ask, "Should I see a psychiatrist, doctor?" The physician responds confidently, "A psychiatrist? Why, you are not crazy, we'll find out what's wrong with you!" At the end of a negative study, however, he is confronted with the fact that the patient does need psychiatric help.

It is much better not to prejudge, and to have a clear and open attitude about emotional problems.

Preventing Further Regression

By the time one has finished the history and physical examination, he has some understanding of the problem. This explanation should be given to the patient in terms he can understand, encouraging him to bring up any questions he may have. If one has been able to come to such a conclusion from what the patient has said, one should emphasize time and again that his symptoms reflect unresolved problems and chronic unmastered fears.

This does not preclude further examinations, and in fact it is important to keep in mind that emotional and organic problems do not exclude each other. The doctor has to carry this burden; it can not be shifted to the patient alone. The ideal situation is one of a healthy partnership, with both doctor and patient working together.

Accepting the Patient as He Is

Anxious patients are not necessarily, and certainly not immediately, reassured by a friendly and firm physician, who seems to know what he is doing. Some of these patients know only too well what murderous thoughts may be hidden behind an aura of friendliness.

Time heals; and it is of the essence in mastering problems. The doctor and the patient will have to have time to get better acquainted with each other, and learn to understand and resolve conflicts.

A woman who is tempted to divorce her abusive husband, but has a sense of obligation towards the children and is afraid to go it alone, is not going to find it easy to make a decision, even after she recognizes the real problem.

On the other hand, we know people do make decisions as difficult as this, and carry through with them, particularly if they have some encouragement and support. A beautiful novel by a psychiatric patient who recovered from schizophrenia after many years of treatment, was titled after the phrase used by her woman psychiatrist early in treatment to explain what the patient could expect. "I never" the doctor said, "promised you a rose garden!"[2]

Reluctant, withdrawn or very frightened patients who take their time to warm up to any kind of relationship, teach the physician the old virtue of the obstetrician, patience. The larger the number of anxious individuals the doctor sees, understands and treats, the easier it becomes to manage them scientifically.

Relatives

It is always useful to see important relatives, either by themselves or accompanied by the patient; and a similar tactful attitude is necessary with them. If their questions are truthfully answered, and they are ready to listen, one can correct many common misconceptions.

The idea that physical symptoms may spring from disturbed relationships to others is a new and threatening one for most people; it forces them to face feelings and thoughts that are usually not pleasant. And yet, if there is to be any relief to the situation, the interpersonal difficulties have to be resolved.

Prevention

It is not an idle exaggeration to say that all patients who come to a physician for help are potentially anxious patients. Unfortunately, many times the physician complicates the problem by over-reacting to it.

A 20-year-old pregnant housewife with mild anxiety symptoms was seen in the hospital after she "went to pieces." In discussing with her obstetrician her fears regarding delivery, he abruptly cut her off and declared that she "belonged on the fifth floor" (the psychiatric unit.) Acceptance of her many fears, and her right to express them, brought immediate relief to her face. She compared this incident with another experience she

had as a very scrupulous adolescent, when an understanding minister had reassured her about her fears of sin and sexuality.

Prognosis

Anxiety can, in some ways, be compared to fever; the presence of moderate anxiety indicates a reasonably well functioning mind. If the patient trusts the physician, and the physician can tolerate the anxiety compassionately, without over-reacting to it, the prognosis is good. One does not try to suppress fever, except when the fever is high or otherwise troublesome, unless one has some idea of its etiology.

With good psychiatric consultation available, the physician can handle the vast majority of uncomplicated cases of anxiety. Even when he refers patients to the psychiatrist, his interest and collaboration with the specialist can do a great deal to get the patient on the road to recovery, and further emotional growth.

Summary

The anxious patient presents a syndrome characterized by signs and symptoms of fear, but he usually does not know the cause of his apprehension. There is commonly a situation in the patient's environment which he perceives as dangerous, because it stimulates forbidden feelings within himself.

It is the physician's function to first understand the situation, and then slowly convey his knowledge to the patient, within the framework of a trusting doctor-patient relationship. If this can be done, improvement usually follows. ☐

Information for Contributors

1. Address scientific manuscripts to the Publication Committee, Michigan State Medical Society, 120 West Saginaw Street, East Lansing, Michigan.

2. Submit original, double-spaced typewritten copy and one carbon copy on letter size (8½ x 11 inch) paper.

3. On page one, include title, authors, degrees, academic titles, and any institutional or other credits.

4. Authors are responsible for all statements, methods, and conclusions. These may or may not be in harmony with the views of the Editorial Staff. It is hoped that authors may have as wide a latitude as space available and general policy will permit. The Publication Committee expressly reserves the right to alter or reject any manuscript, or any contribution, whether solicited or not.

5. Illustrations should be submitted in the form of glossy prints or original sketches from which cuts, or plates, will be made by Michigan Medicine. Michigan Medicine will pay the first $25 of the engraving bill, and the author shall pay the balance. An estimate of the cost will be submitted to authors before cuts are ordered.

6. References will ordinarily be limited to seven in number. Exceptions may occasionally be made.

7. Contributors will be notified as soon as practical if a manuscript is accepted for publication. Unused manuscripts will be returned. Every care will be taken with the submitted material but the Journal will not hold itself responsible for loss or damage to manuscripts.

8. Articles should ordinarily be less than four printed pages in length (3000 words).

9. References should conform to *Cumulative Index Medicus,* including, in order: Author, title, journal, volume number, page, and year. Book references should include editors, edition, publisher, and place of publication, as well.

10. Specify address to which galley proofs should be sent. Proofs will be mailed to authors for correction before publication and should be returned to the editor in 48 hours. If proofs approved by the author are not received by the editor prior to deadline, publication of the article will be cancelled for that issue.

11. The editors welcome, and will consider for publication, letters containing information of interest to Michigan physicians, or presenting constructive comment on current controversial issues. News items and notes are welcome.

12. It is understood that material is submitted for exclusive publication in Michigan Medicine.

Employing the Diabetic

Like the legendary Phoenix new problems rise from the ashes of problems solved. Such is the situation in employment for the diabetic.

Fifty years ago, diabetes in a child or young adult meant total invalidism and early death. Today, with the proper use of insulin and oral hypoglycemic agents, diet and education, diabetics can expect a long life with uninterrupted periods of full activity. Though morbidity may be higher with inadequate metabolic control, the average diabetic rightfully shares the hopes and aspirations of his non-diabetic peer.

One hope is regular employment.

Yet nowadays, the certainty of employment for the otherwise healthy diabetic remains elusive because there exist problems real to both the employer and employee.

The likelihood of employment relates to jobs available, to individual ability, to an assurance of minimal absenteeism and to the potential financial liability assumed by the employer. In a tight labor market with many jobs and few applicants, the employer will overlook certain deficiencies in the employee as long as he can do the work. When a plethora of applicants exist, the qualifications of the individual are more carefully scrutinized. Individual ability means what a man offers to the labor market. Thus, the skilled worker or specialist rarely wants for work while obversely, the semiskilled or unskilled laborer often is unemployable.

The cost of benefits which may accrue to an employee from his group insurance, pension plan or workmen's compensation may affect his employability and may restrict the selectivity of the employer. Thus some employers may not hire certain workers because of "third-party restrictions." In many large industries, hiring involves more than the desire of a man to work and of a boss to hire.

Employment without regard to health and ability is not a right. Diabetics must understand this. They are wise to obtain as much education as possible. Not only should they aspire to positions where the vagaries of their disease are minimized, but they must also achieve a work record of high quality so that their non-diabetic fellow-workers and employers will learn that diabetics are worthy of their hire.

Employers should not prejudge diabetics; let them judge each man's potentiality and performance individually. Prejudices toward employability should not result from one or two bad experiences.

Should an inept left-handed employee jeopardize the employability of all southpaws?

Indeed not, nor does it follow that one diabetic with a high absentee rate mirrors the performance of all diabetics. Let all employers individualize the diabetic applicant. Though all the applicants have the same metabolic disease, varying degrees of severity and potential hazard exist. We feel that unconditional refusal to consider the employment of any diabetic is anachronistic. We want to persuade employers that this opinion is reasonable and defensible. Evidence exists showing equal absenteeism in diabetic workers when compared with employees without diabetes.

To help employers judge the applicant with diabetes on an individual basis, the Michigan Diabetes Association has developed an "Employment Classification." We hope it will serve as a guide toward unbiased judgment of the diabetic applicant by helping the employer individualize his decision.

The degree of severity of an applicant's diabetes together with the frequency of his visits to his physician serve as the basis of the Classification (Table 1). Thus the insulin-dependent diabetic (III-IV) should visit his physician more often than the mild diabetic (I). Generally the more often, within reason, a diabetic visits his physician for medical evaluation, the better will be the regulation of his diabetes. Greater stability means fewer medical problems may develop which might interfere with his employment record or create a work hazard. We know also that the optimal frequency of visits to a physician by a diabetic relates to the nature of his diabetes.

While the severe diabetic needs insulin, in the milder diabetic a diet alone or the concomitant use of an oral blood-sugar-lowering agent will suffice. Diabetics in the latter category usually in-

---

This is a statement prepared by the Michigan Diabetes Association Committee on Employment. The approach is practical and highly commendable as a model to be followed by others similarly concerned with employing people with handicaps of a chronic nature. Members of the Committee are Fred W. Whitehouse, M.D., Chairman; Nelson Taylor, M.D.; George Thostenson, M.D.; Douglas Wood, M.D.; William Jend, M.D.; William L. Lowrie, M.D.; and Martin Burton, M.D.

— The Editor

DIABETES AND EMPLOYABILITY: CLASSIFICATION

Current Treatment Status of Diabetes	History of Professional Care A Sees Physician at least four times a year	 B Sees Physician as necessary, but at least once a year	 C Sees Physician less than once a year
I. Diet Alone	1	1	2
II. Diet and Oral blood-sugar-lowering agent	2	3	4
III. Diet and Insulin	3	4	5
IV. History of Frequent Hypoglycemic Episodes	4	5	6

This scale is an index of the relative stability of the applicant's diabetes. The scale ranges from Grade 1. (most favorable for employment) through Grade 6. (least favorable for employment). Factors such as job hazard, the Company's employment policy, insurance status, etc., must be considered on an individual basis.

clude those workers who develop their disease in middle-life after years of fruitful employment. The former group, the younger diabetics, present greater vulnerability, yet more frequent visits to a physician by this diabetic seem to offer greater physical stability.

By using this classification, we hope employers and their medical advisors will feel more confident in their evaluation of the individual applicant with diabetes. This classification will not answer all individual problems; no classification will do that. However, we hope use of this classification will permit one to judge a diabetic individually rather than as an unidentifiable member of a large group.

Some physicians may object to this classification because the degree of metabolic control is unspecified. What is control? Even experienced physicians disagree. This classification assumes that control of the diabetes will be affected by the regularity with which a diabetic visits his physician. The more insulin-dependent the diabetes, the more often the diabetic should visit his physician for re-evaluation of the diabetic state.

Others may say that nowhere do we mention the complications of diabetes. If there be neuropathy, diminished vision, or a circulatory problem, consider this on its own merit (or demerit). We believe that a complex classification with awkward criteria will hinder its applicability. This classification seems sufficiently practical to warrant a trial. The Michigan Diabetes Association hopes to do this. We hope individual physicians who face the problem of giving opinions on risks or lack of them in hiring the diabetic will use this classification. Any physician may obtain copies from the Michigan Diabetes Association. □

American Medical Care —Fact and Fancy

BY PAUL S. FRIEDMAN, M.D.
PHILADELPHIA

We, the physicians of America, are eager to participate in a continuing dialogue with the American people, so that through our combined efforts, the best medical care at the lowest possible cost will result. We particularly want to bare to the American people our goals, our aspirations, and our accomplishments, from a vantage point of truth, to serve better the people of the United States.

The medical profession welcomes constructive efforts at criticism. In fact, it participates in self-evaluation continually. Certain critics and criticisms, however, are unjust. Instead of collecting the facts objectively, and drawing conclusions from them, some critics start with unfair prejudgments, and then distort the facts, creating untruths and half-truths to support their conclusions. It is our responsibility to our patients that demands that we correct this misinformation, for such misleading information can be damaging to them when they are being treated, causing confusion and distrust.

The following are just a few examples of these unfair criticisms and the facts about them.

Number of medical colleges, medical students, and physician population.

It has been unfairly maintained that the medical profession and the American Medical Association are attempting to restrict the number of medical colleges and students. The reverse is true. The American Medical Association has stimulated new schools, frequently advising groups, planning and developing new schools. Since 1947, 11 new schools have opened, totaling 88; and by 1970 an additional 13 will be in operation, totaling 101. Six more are assured and another six are possible by 1975.

The American Medical Association supported legislation providing federal funds for medical college construction.

In addition, the American Medical Association and its branches, the state and county medical societies, have embarked on recruiting programs for medical students.

The American Medical Association has established a loan guarantee fund, to give financial assistance to medical students, interns and residents, supported by voluntary contributions of physicians, medical associations, private companies, and foundations. Over $35 million have been lent since the fund's founding in 1962. In addition, loan funds are available through state and county medical societies.

In 1960, there was one physician for 737 people; in 1965, there was one for every 681, a faster rate of growth in physician population than general population.

In the past, efforts to predict future physician needs have been most inaccurate. In 1959, the Bane Committee gloomily predicted we should never reach by 1975, the needed total of 330,000 physicians including osteopathic physicians. Actually, there will be a minimum of 360,000 physicians by 1975, exclusive of osteopathic physicians.

There has, however, been a functional and geographic maldistribution of physicians. There has been a marked reduction in the number of family physicians. This has been strongly influenced by the tremendous overemphasis on specialization and research in the medical colleges, largely stimulated by the unbalanced influx of federal funds into these areas. At the present time, efforts are being made to restore the family physician to his central role in American medical care.

An American Board of Family Medicine has been created and the American Medical Association has recognized Family Medicine as a specialty in medical practice. Recently, the American Medical Association commissioned a Report of a Citizens Commission on Graduate Medical Education. Many recommendations are to be implemented, such as a residency training program in family medicine, encouragement of group practice among family physicians and others, staff appointments and full practice privileges for family physicians on hospital staffs, as well as integrated programs in medical colleges, staffed by family physicians, to stimulate training and interest in family medicine.

There has been a tendency for physicians to concentrate in metropolitan areas, with resultant

---

(Editor's Note: This article is reprinted with the permission of both the Nebraska State Medical Journal and the author.)

diminished concentration in other areas. To offset this, the American Medical Association in conjunction with the Sears Roebuck Foundation has been sponsoring rural location of physicians. The Kansas Rural Health program, developed by Dr. Franklin Murphy, has been most successful, in supplying rural medical needs. It involved the enlargement of the capacity of the Kansas Medical School to train medical students, the creation, through voluntary local fund raising, of facilities for medical practice throughout the state. Then a program of continuing education for rural physicians was set up consisting of two parts: 1. Traveling teams of consultants originate from the medical college and hospital, to visit different areas of the state throughout the year, holding clinics and offering consultation. 2. Rural physicians return to the medical college periodically for several weeks to months of refreshing training.

Many state societies have placement programs for physicians. Emergency medical services have been instituted by many county medical societies.

In addition, the tendency to overload full time staffs of medical colleges and larger hospitals must be reversed; this, too, is contributing to the maldistribution of our younger physicians.

Quality of medical care. Improperly documented criticisms of the quality of American medical care have been publicized. In many cases, these have used data originating in articles written by physicians, for self-evaluation and for education of their colleagues; incomplete information has been abstracted to support untrue conclusions.

A published article has been referred to as reporting that 90% of 21 surgical deaths in infants and children was the result of doctor error, and therefore evidence of poor medical care. But this study involved more than 4,000 operations in a single hospital, over a 10 year period beginning in 1947, 20 years ago; among the 21 there were many serious abnormalities at birth; and the article further stated, "There has been a dramatic decrease in operative deaths during the past four years, 1958-1961."

In other cases, efforts are made by critics to use statistics, usually from England and Sweden, to attempt to prove that the practice of medicine in the United States is inferior. Actually, if true statistical comparison can be made, it demonstrates that American medicine is second to none.

Basically, however, when comparison is made between one nation's statistics and another, comparisons may not be occurring between exactly the same events.

For example, Sweden's infant mortality rate is 1% below that of the United States. But, in Sweden, a baby is not alive until he breathes; such a baby's death would be called foetal death. In the United States, the presence of a heart beat or voluntary motion would classify the baby as alive, and subsequent death would be classified as infant mortality. Furthermore, the frequent use of abortion, in Sweden, alters these statistics further.

Further, while it is true that the average Swede lives to age 73, and the average American to the age of 70.3, a Swede in Minnesota outlives a Swede in Sweden.

As Waldo Von Greyerz, M.D., Swedish delegate to the World Medical Association pointed out, "I don't know how you would compare medicine in Sweden . . . with medicine in America. It surely can't be done with infant mortality and longevity statistics. People who compare such things obviously are hunting for headlines."

There are numerous other areas in which similar unfair criticism is publicized. These include the relation of physicians' fees to the rise in cost of medical care, the position of the medical profession and the American Medical Association to change and new legislation, the need for further governmental involvement in the distribution of medical care, among others. There is no question that continuous change and improvement is necessary to keep the quality of medical care in the United States at its high level and keep the cost as low as possible. The physicians of America are committed to that goal.

Let us remember, however, that the medical encounter involves the relation between a patient in distress and a physician equipped mentally, spiritually, and technically to relieve that distress and to prevent its occurrence. In making changes, let us preserve this as the basic component of high quality care.

The people of America are fortunate in having the finest medical care structure the world has ever seen. Let us recall that this has resulted because of the basic emphasis upon the individual patient physician encounter, with the physician basically and primarily responsible to that patient. Let us recall that this development has occurred in a basically private enterprise system, with the vast proportion of the financial support coming from private funds. Let us recall that nowhere else has there been such a development of voluntary nongovernmental health insurance. Let us remember that in those countries where the influence of government through the use of tax funds and control, has become dominant in the medical structure, that the quality of medical care has declined and the cost has excessively risen.

There is much to be done. There is a great need to restore the family physician to his primary position in American medical care; there is a great need to foster increased group activities among physicians, but always preserving the basic physician patient bond; there is a related need to restructure the medical college curriculum to reduce the emphasis upon accumulation of unending data by the student, with accompanying emphasis upon scientific knowledge as an end in itself, and return to basic principles with emphasis upon the humane and spiritual goals of the physician, using scientific knowledge as a tool for the help of patients. Related to this, there is the requirement that funds be redistributed in the medical colleges to meet these goals; the family physician must be given a position of significance and responsibility in both the hospital and medical college; with the resultant deemphasis upon unnecessary consultation and unnecessary laboratory studies, often done as a routine, rather than as indicated. As this is done, cost will be reduced; investigation and research must be supported, but not to the exclusion of providing individualized high quality patient care; the voluntary health insurance program (commercial insurance, Blue Cross-Blue Shield) must be continually expanded and strengthened to help the American citizen provide for the cost of medical care; government participation through the use of tax funds should be limited to those who financially require such help, and should be furnished through the states; governmental control and intervention should be resisted and minimized. There are many other vital goals.

Let all of us, physicians and citizens of the United States, join in a continuous program of change to improve further the quality of medical care and reduce the cost as much as possible. Let us guard against change, however, which will destroy the basic ingredients which have made American medicine great. ☐

Children's Bureau Lists Possible Issues for '70 Michigan Conference

Plans for the 1970 Michigan White House Conference on Children and Youth are being developed now by the Michigan Youth Commission.

The conference planning committee has decided to build its work around the age group of "Minus Zero to Five Years." The conference will study how these small children and their parents "are affected by the tensions, concerns and anxieties of depravation and affluence."

Medical society leaders will be interested in six suggested conference issues proposed by the Federal Children's Bureau for the 50 state conferences. The six issues included:

"1. How it is possible to satisfy the growing urge on the part of the youth for direct participation in decision-making in those areas which directly affect them, and still maintain clearly established areas for final authority?

"2. In what ways should legal protection and rights of children and youth be strengthened or modified?

"3. Where does the youth's individual right and responsibility for defining the limits of sexual behavior leave off, and the societal begin?

"4. How can the numerous educational tasks in the society be distributed so that young people have access to the learning situations they want and need?

"5. What frontiers of individuality should today's children and youth seek?

"6. How can we redirect our societal dynamics in order to emphasize human development?" ☐

Special "Ars Medica" Exhibition Being Brought to Detroit as Feature For MSMS 1968 Annual Session

BY ELLEN SHARP

CURATOR OF GRAPHIC ARTS
DETROIT INSTITUTE OF ARTS

Ars Medica is the title of an exhibition of prints depicting medical subjects which will be shown at The Detroit Institute of Arts from September 22 through October 20, 1968. This exhibition has been arranged in cooperation with the Institute's Department of Graphic Arts and a special committee of physicians especially for the 1968 Annual Session of the Michigan State Medical Society in Detroit, September 25-26.

The exhibition will consist of over 130 original works of art representing all types of graphic media—woodcuts, engravings, etchings, lighographs and serigraphs. The prints are grouped in 21 different categories.

SOME OF THE subjects covered are Hospitals in Peace and War, Hygiene and Preventive Medicine, Medical Teaching, The Madhouse, and Allegories of the Healing Arts.

One of the earliest prints in the exhibition is a woodcut from Ketham's *Fasciculus Medicinae* published in Venice in 1493. Entitled "The Zodiac Man" it is the oldest printed bloodletting chart.

A fine impression of the first etching by the great German graphic artist, Albrecht Durer, *Plate of Sketches,* depicts the four temperaments (or dominant humors) — the choleric, sanguine, melancholic and phlegmatic.

A Sixteenth-century etching by Abraham Bosse illustrates one of the commonest therapeutic measures of that era — phlebotomy. This print is characteristic of Bosse's work showing the life of the upper middle class in France with a wealth of detail.

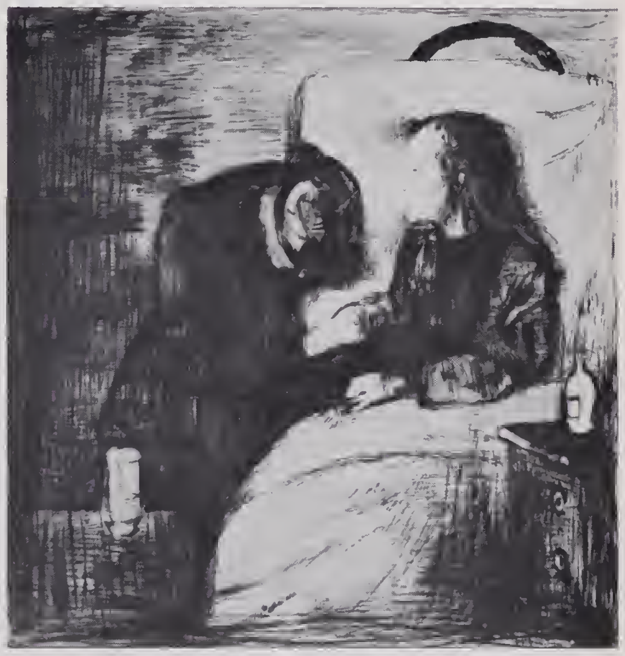
A pioneer example of color printing, developed in the Eighteenth century, is Jacques Gautier Dagoty's mezzotint *Muscles of the Head,* plate I from *L'Anatomie de la Tete,* Paris, 1748.

The great caricaturists and humorists of the eighteenth and nineteenth centuries did not neglect the medical profession. Thomas Rowlandson, George Cruikshank, James Gillray, Gavarni, and Honore' Daumier are represented in the exhibition.

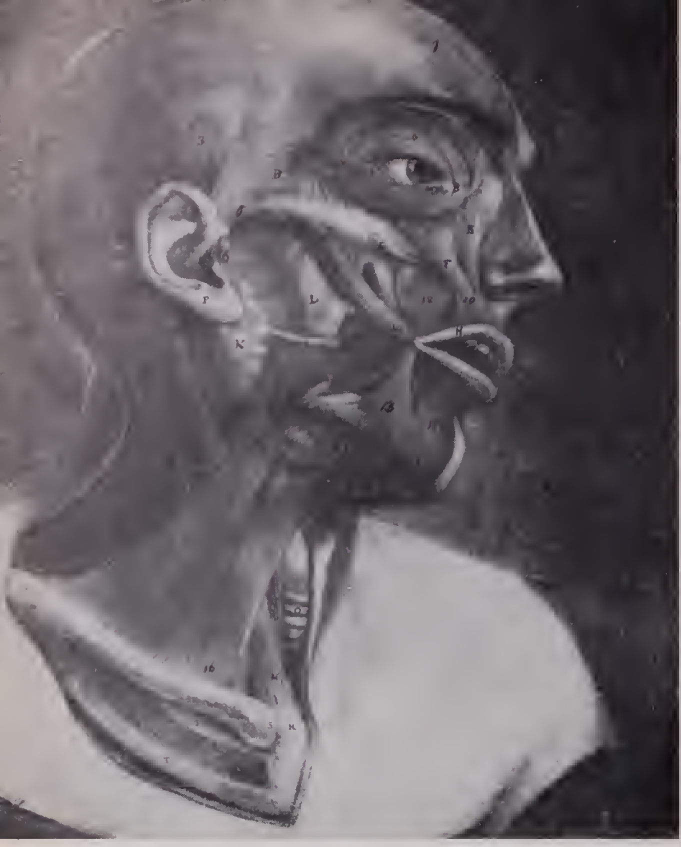
Moving and powerful works by modern artists with medical themes are prints by Edvard Munch, Kathe Kollwitz and Michael Mazur.

SOME OF THE MOST interesting prints in the exhibition are portraits of great physicians of the past, such as Paracelsus, Ambroise Pare', Andreas Vesalius, William Harvey, and Carolus Linnaeus.

One section of the exhibition reminds us that medical men often have distinguished themselves in the arts. Especially notable have been the contributions of members of the medical profession to literature. Engraved portraits of Francois Rabelais, French writer and a member of the faculty of the great medical school of Montpellier, and of

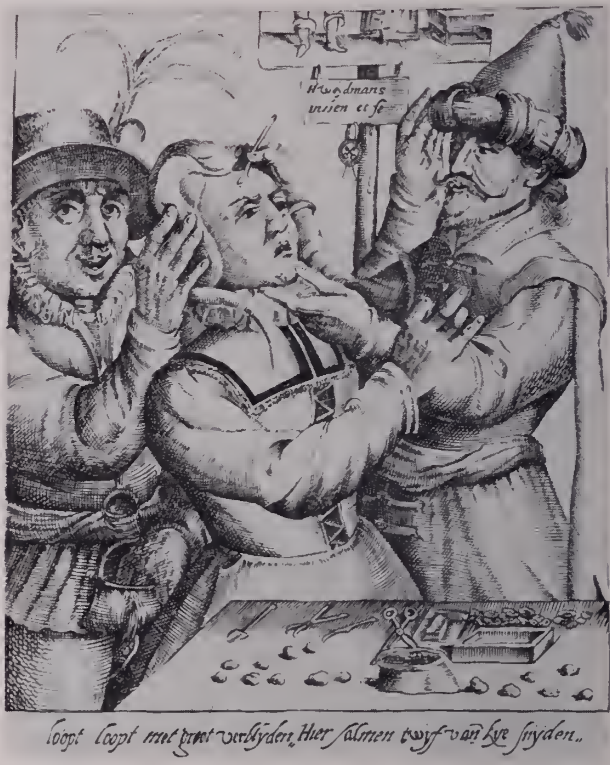


The Sick Child 1894, a drypoint, was made by Edward Munch (Norwegian, 1863-1944). Drypoint is a process often combined with engraving and etching. A metal tool with a tapered point is used to scratch the design on the plate. The burr raised on the plate on each side of the line created by the drypoint tool produces a soft, blurred line quite different from the sharp, swelling line of the engraver's burin, or the flowing, thread-like etched line.



The Muscles of the Head, plate I of **L'Anaotomie de la Tete,** Paris, 1748, is a mezzotint printed in color by Jacques Gautier D'Agoty. A mezzotint is a print produced by a variant of the engraving process, developed to produce tone. A metal plate is roughened uniformly with a tool called a rocker which has a curved, serrated head; gradations of tone are obtained by scraping and burnishing away the roughened surface. The process, invented in the seventeenth century, was used extensively in the eighteenth century.

Operation for Stones in the Head, an engraving, was done by H. Weydmans (Dutch, early 17th Century). An engraving is a print taken from a metal plate on which the design has been incised with a sharp instrument, the burin or graver. The incised plate is inked, wiped and printed. The successful printing of a metal plate requires the pressure of a double-roller press to force the paper into the incised, inked lines.



H.Weydmans
inven et fe

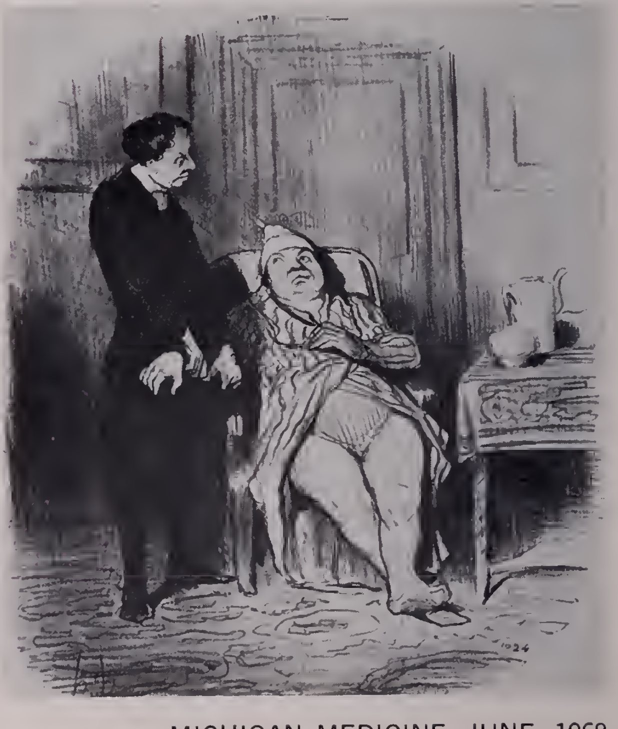
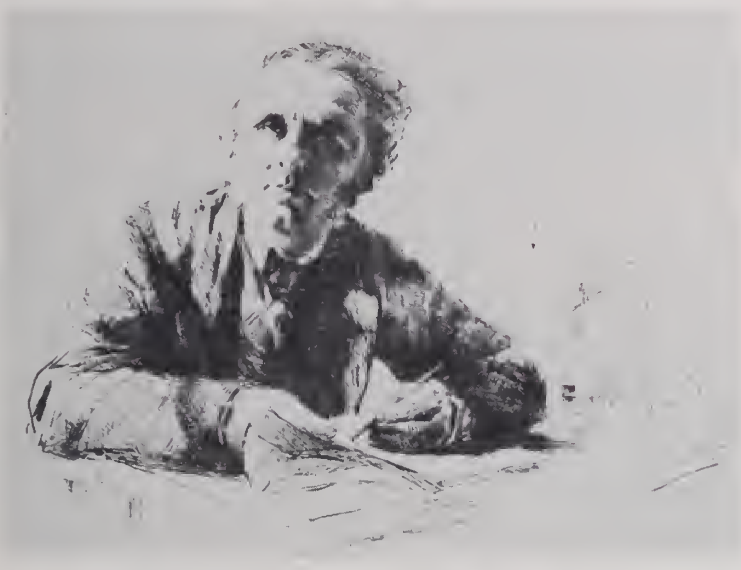
"Oh Doctor, I'm sure I'm consumptive" says the patient in this lithograph by Honore' Daumier (French 1808-1879). This appeared in a series **All One Could Wish For (Tout ce qui' on voudra),** Paris, 1847. Lithographs are made from a stone block (or zinc plate) on which the areas of the design have been drawn with a greasy substance applied by pen, brush or crayon. The design then is fixed in the stone by treating it with acid and gum arabic. For printing the surface of the stone is dampened and then rolled with greasy ink. The greasy ink adheres to the grease of the image and is repelled by the dampness from the rest of the surface. The inked stone is then printed in a press in which sliding pressure is applied rather than rolling pressure as in an etching press. For color printing, a separate stone is used for each color.



Self-Portrait 1862 is an etching by Sir Francis Seymour Haden, (English, 1818-1910). An etching is a print pulled from a metal plate which was first covered with an acid-resistant ground. The design is drawn through the ground with an etching needle. When the plate is immersed in acid, the plate is etched wherever the metal has been exposed by the needle. The plate is inked and printed in the same manner as an engraving. If the etcher wishes to reinforce certain lines on his etched plate, he repeats the etching process. That part of the plate not to be re-etched is covered with a stopping-out varnish before it is immersed in the acid bath.



Ellen Sharp, author of this article, is curator of graphic arts for the Detroit Institute of Art, shown at right. Miss Sharp, in presenting this special exhibition, has worked closely with a group of Detroit area physicians and wives interested in art. The key man in giving the go-ahead to the project was Willis Woods, director of the Institute of Art.

Sir Thomas Browne, the English philosopher and physician, will be shown in the exhibition.

The fine etched self-portrait by the distinguished surgeon Sir Francis Seymour Haden who was also a master of etching, takes on greater meaning for the viewer when it is considered in the light of Haden's own remarks in a lecture to the Royal Society of Painter-Etchers and Engravers:

"How much sooner would the eye — accustomed to observe and estimate closely the differences of color, aspect, weight and symmetry — learn to gauge their aberrations as the signs which make up the *facies* of the disease; how much better the hand, trained to portray them accurately, be able to direct with precision and safety the course of the knife!"

THE EXHIBITION COMES in its entirety from the permanent collection of the Philadelphia Museum of Art. Through the generosity of Smith Kline & French Laboratories, a special fund was created in 1948 for the purchase of prints of medical interest. Only one condition was placed by this pharmaceutical firm on its gift, namely that the objects acquired be worthy of inclusion in a museum collection. The choice was left entirely to the curator of prints at the Philadelphia Museum. The result is not only a collection showing the essential aspects of medical iconography in all its fascinating variety but also a group of prints distinguished for their fine impressions and high artistic quality.

Recently The Philadelphia Museum has announced the establishment of an Ars Medica Center at the Museum. This has been made possible by a major grant from the Smith Kline and French Foundation. Plans are underway not only to enlarge the collection of prints and drawings relating to the medical sciences but also to develop a reference file and an information retrieval system.

MOST OF THE principal "hand methods" of making prints are represented in the exhibition. The history of Western printmaking begins in the fifteenth century as paper, which had been first made in Spain in the twelfth century, became generally available throughout Europe. The first technique to be developed was the woodcut. It was closely followed by engraving and later etching. Lithography was not discovered until the end of the eighteenth century; silk-screen printing is a twentieth-century refinement of the stencil process.

THE PRINTS IN the *Ars Medica* exhibition will include prints made by other processes in addition to the examples reproduced in this article. The other processes include:

WOODCUT on the cover, to help promote the *Ars Medica* exhibition at The Detroit Institute of Arts during the 1968 MSMS Annual Session in Detroit in September, is attributed to the Woodshop of Titian (Italian 1477-1576), entitled *The Ninth Plate of Muscles* appeared in Vesalivs's *De Humani Corporis* Fabrica, Basle, 1543. The areas not to be printed were cut away from the woodblock and the prints were made by applying ink to the raised surfaces and applying hand pressure.

AQUATINT — a print produced by a variation of the etching process. Areas of tone are obtained by covering the plate with rosin dust, then heating it so that the particles adhere to the plate. The plate is immersed in acid and is etched wherever the particles have left the plate exposed.

SILKSCREEN (OR SERIGRAPH) — a variation of the stencil process. A finely-woven fabric, usually silk or nylon, is stretched over a wooden frame to form "the screen." An image or design is created by making some parts of the screen opaque and others open. Color pigment is then forced through the fine mesh of the open parts of the stencil by the use of a tool called a "squeegee."

The processes used for the prints reproduced in this article are explained under each print.

COOPERATIVE PROJECT . . .

This special *Ars Medica* Exhibition is being brought to Detroit September 22 through October 20 by the Detroit Institute of Arts and a group of Detroit area physicians and wives interested in art. The group has contributed the funds necessary to transport the exhibition from The Philadelphia Museum to Detroit so the exhibit can be an added attraction for the 1968 MSMS Annual Scientific Session, September 25-26. Members of the co-sponsoring group include Dr. and Mrs. Irvin F. Burton, Dr. and Mrs. Alfred Golden, Dr. and Mrs. James J. Lightbody, Dr. and Mrs. Paul E. Mattman, and Dr. and Mrs. Milton R. Weed.

Let's be specific about Campbell's Soups… and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

clinical practice an occasional uncooperative or drug-sensitive patient spouse makes 100 per cent cure of trichomonal vaginitis in large series patients difficult.

Further a very few patients who apparently absorb Flagyl poorly d a few rare instances of trichomonads resistant to Flagyl have been ported. Nevertheless, approximately half the United States investiga-s report a final cure rate of 100 per cent with Flagyl.

Sixty papers[1] published on the use of Flagyl in trichomoniasis in the ited States and comprising a total of 10,700 patients have been evalu-d. In thirty of the papers it was declared that all patients adequately lowed and treated were free of trichomonal infection.

Analysis of all of these papers shows that the incidence of cures for *initial* course of therapy ranged from 76.6 per cent to 100 per cent. e cure rates after retreatment of female patients and treatment of their sbands when indicated ranged from 84.7 to 100 per cent. The average al cure rate reported in all investigations was 97.1 per cent.

minal cramping, constipation, stomatitis, mbness or paresthesia of an extremity, joint ins, confusion, irritability, weakness, cystitis, vic pressure, dyspareunia, fever, polyuria, in-ntinence, decreased libido, nasal congestion, octitis and pyuria. Elimination of trichomonads y aggravate candidiasis.

osage and Administration: In women: one 0-mg. oral tablet three times daily for ten days. vaginal insert of 500 mg. is available for local rapy when desired. When used, one vaginal insert should be placed high in the vaginal vault each day for ten days; concurrently two oral tablets should be taken daily.

In men: When trichomonads are demonstrated, one 250-mg. oral tablet twice daily for ten days in conjunction with treatment of his female partner.

Dosage Forms: Oral tablets–250 mg.
Vaginal inserts–500 mg.

Invite Nominations For MSMS Honors

July 1 will be the deadline for component county medical societies which wish to offer nominees for the MSMS "Outstanding Physician of the Year Award" and for the MSMS "Certificates of Commendations."

The nomination forms and covering letters recently were sent to every county society.

D. Bonta Hiscoe, M.D., Lansing, is chairman of the committee to select the outstanding physician and Marjorie P. Meyers, M.D., Detroit, will direct the work of the other committee. Both were appointed by MSMS Speaker James B. Blodgett, M.D.

OUTSTANDING PHYSICIAN AWARD

The 1964 House of Delegates took action to establish annual recognition of Michigan's Outstanding Physician and the award was presented in 1965 to F. L. Troost, M.D., in 1966 posthumously to William A. Hyland, M.D., and in 1967 to Henry Cook, M.D., Flint.

The resolution adopted in 1964 by the Delegates provided that this recognition be given to a member of the profession, "who is not necessarily a family physician, nor one advanced in years . . ." The resolution resolved also "that consideration be given to the physician's civic accomplishments as well as his professional accomplishments."

CERTIFICATES OF COMMENDATION

The 1961 House of Delegates, in approving the Certificates of Commendation, pointed out that the new award "may include both scientific and/or public service and may be awarded to one or more physicians annually who distinguish themselves in the medical profession."

The House of Delegates has approved the recommendations each year of the Committee. The names of previous recipients are listed below:

1962

Jerome W. Conn, M.D., Ann Arbor
G. D. Cummings, M.D., Lansing
Charles S. Kennedy, M.D., Detroit
Robert L. Novy, M.D., Detroit

1963

Forest D. Dodrill, M.D., Bloomfield Hills
Charles J. Jentgen, M.D., Detroit
John M. Sheldon, M.D., Ann Arbor
Homer H. Stryker, M.D., Kalamazoo

1964

Goldie B. Corneliuson, M.D., Lansing
John S. DeTar, M.D., Milan
Robert M. Heavenrich, M.D., Saginaw
Norman F. Miller, M.D., Ann Arbor
E. Gifford Upjohn, M.D., Kalamazoo
Orus R. Yoder, M.D., Ypsilanti

1965

Fred J. Hodges, M.D., Ann Arbor
Traian Leucutia, M.D., Detroit
Remus J. Robinson, M.D., Detroit

1966

Arthur C. Curtis, M.D., Ann Arbor
Lionel L. Davis, M.D., Mt. Pleasant
Mark Marshall, M.D., Ann Arbor
Harold J. Meier, M.D., Coldwater
Ralph H. Pino, M.D., Detroit
Alfred B. Swanson, M.D., Grand Rapids
Harry A. Towsley, M.D., Ann Arbor

1967

Frank J. Busch, M.D., Saginaw
Willis Herbert Huron, M.D., Iron Mountain
Frederick J. Margolis, M.D., Kalamazoo
David I. Sugar, M.D., Detroit, (posthumously)
Raymond W. Waggoner, M.D., Ann Arbor
Charles H. Wright, M.D., Detroit

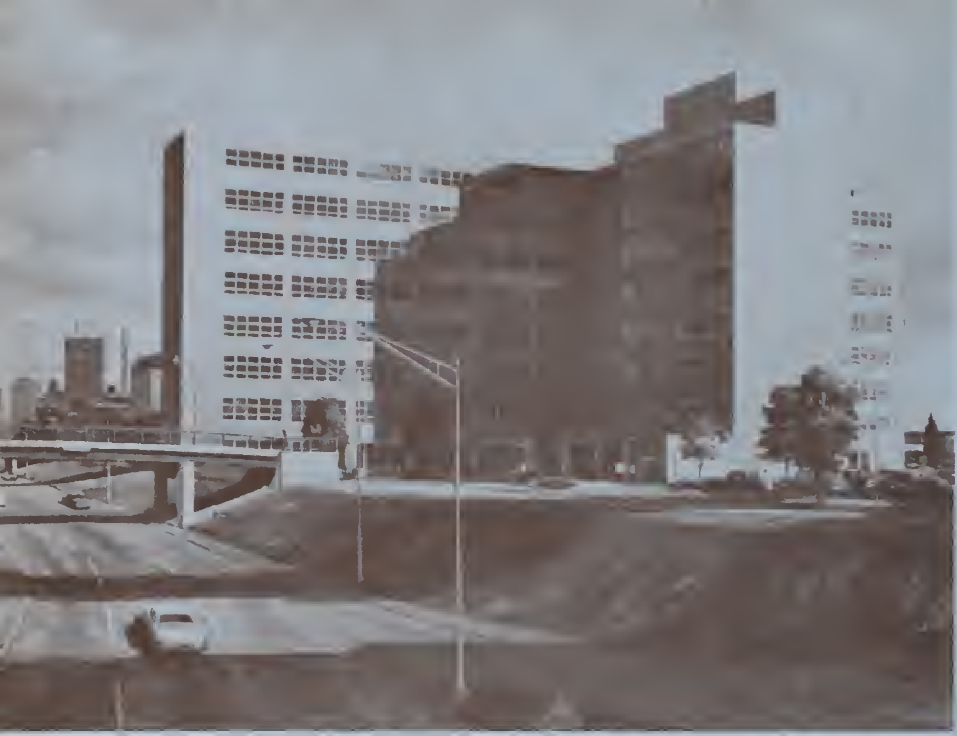
Sees Health Manpower Recruitment as Job For the Community

Recruitment to provide the right kind of persons to fill the rural health needs in Michigan and the nation "must be a total community effort," Robert E. Rice, M.D., Chairman of the MSMS Committee on Rural Medical Service, recently wrote to the MSMS Council.

Doctor Rice served recently as the MSMS representative to the National Conference on Rural Health in Seattle.

Doctor Rice, in his conference report to The MSMS Council, suggested eight possible implications for Michigan:

1. Develop more intensive and extensive First Aid Training.
2. Improve and coordinate emergency communications.
3. Improve transportation of injured.
4. Meld the will of people and needs of people with know-how of specialist.
5. Anticipate variegated forms of providing health care.
6. Develop awareness of needs of providers of medical care and other health care in communities, especially rural.
7. Continue to improve dissemination of medical knowledge to profession.
8. Include health care planning in total community planning.



SQUIBB PRESENTS WSU PAINTING TO HELP OBSERVE CENTENNIAL

E. R. Squibb and Sons, Inc., recently presented as part of the WSU Centennial, an original oil painting of the Wayne State University School of Medicine to its dean, Ernest D. Gardner, M.D.

Representing Squibb was Raymond J. Powers, Squibb vice president for market planning.

The painting which shows the Basic Science Building is the work of the well-known artist, Robert Lavin.

Dean Gardner felt that this particular view would be lastingly and sentimentally remembered by every graduate.

The painting is part of a long-range Squibb plan to create a collection of original oil paintings representative of the medical schools of America.

The U-M received a painting last year during its Sesquicentennial.

AMA Aids SAMA In Pilot Effort

A student-to-people project to communicate health information to residents of lower income indigent neighborhoods was announced at the recent SAMA annual meeting in Detroit.

David Kindig, SAMA president, announced that the AMA is financing a $39,000 pilot project in Kansas City to utilize freshmen in high school up to graduate medical students to personally contact and work with residents of indigent areas and inform them of existing medical facilities available to them.

SAMA will administer the project and its Kansas City chapter will spearhead the effort in cooperation with other local organizations.

"In Kansas City, medical students have managed to smash the wall of mistrust between the 'haves' and 'have-nots' by demonstrating a determination and willingness to work with the people on their terms, in their neighborhoods," said Kindig in his comments to the SAMA convention.

MSMAS Plans July Seminar

"Education" is the key word for the 1968 Summer Seminar of the Michigan State Medical Assistants Society. This year's Seminar is to be July 20-21 at Boyne Highlands, Harbor Springs, Michigan.

Designed as an annual event for continuing education of medical assistants, the two-day meeting will feature physicians speaking on a variety of subjects. Included will be: Robert I. Goldsmith, M.D., assistant professor, Department of Ophthalmology at the University of Michigan, on "Some Common Misconceptions in Eye Disease."

Paul W. Gikas, M.D., associate professor, Department of Pathology at the University of Michigan, will speak on "The Pathogenesis of Fatal Injuries in Highway Accidents."

"A Working Philippine Vacation, Experiences Unlimited" is the topic of Sidney N. Smock, M.D., Midland anesthesiologist, who will deliver the banquet address on Saturday evening, July 20.

A panel discussion will comprise the Sunday, July 21, program. Speaking on "The Medical Assistant and Office Management" will be R. Timothy Hogan, member of the Board of Directors of Professional Management, Ann Arbor. Marcus L. Plant, J.D., professor, University of Michigan Law School, will discuss "The Medical Assistant and the Law."

"The Medical Assistant and Public Relations" is the topic of Barry H. Alford, M.D., Plymouth, Chairman of the advisory board of the Washtenaw County Medical Assistants and member of the MSMAS Advisory Committee. Winslow G. Fox, M.D., Ann Arbor, Chairman of the MSMS Medicine and Religion Committee will discuss "The Medical Assistant and the Patient with Special Needs."

Chairman of the 1968 Summer Seminar is Mrs. Patricia Austin of Ann Arbor.

Busy H/D Committee Chairmen

The committees of the MSMS House of Delegates are hard at work completing assignments and reports for the September session. The following men have been appointed as chairmen by Speaker James B. Blodgett, M.D.:

COMMITTEE TO RE-EVALUATE THE DUTIES OF THE PRESIDENT – C. Allen Payne, M.D., Grand Rapids

COMMITEE ON MEDICAL STAFF SURVEY OF HOSPITALS – Rosser L. Mainwaring, M.D., Dearborn

COMMITTEE ON CERTIFICATES OF COMMENDATION – Marjorie Peebles-Meyers, M.D., Detroit

COMMITTEE TO SELECT MICHIGAN'S OUTSTANDING PHYSICIAN – D. Bonta Hiscoe, M.D., Lansing

COMMITTEE ON PROCEDURES OF THE HOUSE OF DELEGATES – Noyes L. Avery, Jr., M.D., Grand Rapids

COMMITTEE ON PROFESSIONAL LIABILITY INSURANCE – John G. Slevin, M.D., Grosse Pte. Park

COMMITTEE TO STUDY FINANCIAL STRUCTURE OF MSMS – James D. Fryfogle, M.D., Southfield

---

UP Medical Event June 21-22

Bradley M. Harris, M.D., MSMS President from Ypsilanti will speak at the Upper Peninsula Medical Society's 75th Annual Meeting at the Four Seasons Club in Pembine, Wisconsin, June 21-22, on "Tomorrow's Doctor."

MSMS Past President, George W. Slagle, M.D., will speak on "The Physician's Role in Use of Health Care Resources."

Ovid O. Meyer, M.D., professor of medicine at the University of Wisconsin, will talk about "Present Day Treatment of Leukemias and Lymphomas," and "Recent Advances in Treatment."

Other speakers are George E. Collentine, Jr., M.D., director of the Burn Center at St. Mary's Hospital in Milwaukee, who will discuss "Emergency Management of Burns;" Ralph L. Suechting, M.D., a neurosurgeon from Neenah, who will speak on "Post Traumatic Head Pain and Neck Pain;" James W. Nellen, M.D., orthopedic surgeon with the Green Bay Packers, whose talk is entitled "Strapping of Common Athletic Injuries;" and Ernest O. Henschel, M.D., professor of anesthesiology at the Marquette School of Medicine, who will talk on "Pre-and Post-Operative Medication."

Registration for the meeting begins at 5 p.m., June 20.

TO INVITE OSTEOPATHS

The Board of Directors of the Oakland County Medical Society recently passed a motion that the society pursue an active program of inviting osteopathic physicians to attend the society meetings.

Aiuto to Lead WSU Alumni

New officers for the Wayne State University School of Medicine Alumni Association were elected at the Centennial Clinic Day and Alumni Reunion in Detroit May 15.

James Aiuto, M.D., Grosse Pointe, took office as president along with Frank B. Walker, II, M.D., Grosse Pointe, and William A. Harrity, M.D., Grosse Pointe, as president-elect and secretary, respectively. Warren O. Nickel, M.D., Dearborn, continues as treasurer.

Elected to the Association's Board of Governors were Doctors James J. Horvath, Grosse Pointe; Charles C. Vincent, Detroit; and David Jacknow, Huntington Woods.

Outgoing president is Mario A. Petrini, M.D., Detroit.

NOW IN VIETNAM

Most recent Michigan physician to leave for Vietnam under the AMA Volunteer Physicians for Vietnam program is Armand M. LaSorsa, M.D., of Manistique. Doctor LaSorsa, a general practitioner, left for South Vietnam in early May and will return in July.

"Formula for Progress Against Cancer" was the focus of a recent MAP TV broadcast by WJIM-TV in East Lansing. From left to right are Hugh Brenneman, MSMS and MAP Executive Director, who hosts the weekly program; Melvin L. Reed, M.D., of Detroit, associate clinical director of the Milton A. Darling Memorial Cancer Center and assistant professor of oncology at Wayne State University; Alan F. Phillips, M.D., of Flint, a radiotherapist at Hurley Hospital; Max E. Dodds, M.D., also from Flint, chairman of the MSMS Cancer Committee; and Helen Menton, producer of the show.

MAP Honors Gross, Nolen

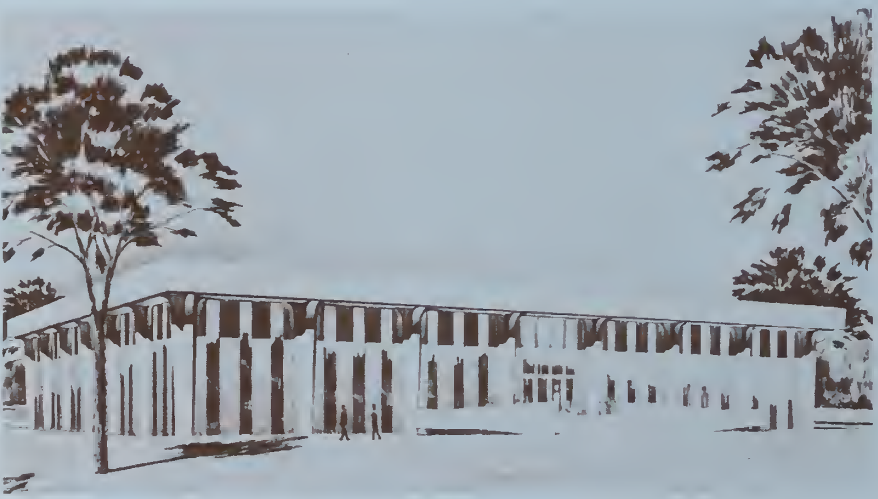
Harold F. Gross, president of Gross Telecasting Company (WJIM-TV and radio in Lansing) received the Outstanding Service Award, and John G. Nolen, D.D.S., of Lansing, received the Distinguished Award during the ninth annual Congress of the Professions, May 10-12 at Boyne Highlands.

The Outstanding Service Award is given annually to "An individual who has rendered greatest service to the professions represented in MAP." The Distinguished Award, also given annually, is for "One member of MAP who has made an outstanding professional contribution."

The Congress continued Luther R. Leader, M.D., Royal Oak, for a two-year term on the MAP board of directors. G. B. Saltonstall, M.D., Charlevoix, and J. Russell Brink, M.D., Grand Rapids, have another year to serve as members of the board. The board will elect officers at its next meeting.

Theme of the Congress this year was "Practical Aspects of the Professional Concept."

(Further details will appear in future issues of *Michigan Medicine*.)



WSU Medical Library Project Proceeds

Ground is scheduled to be broken this year for a $2,000,000 Shiffman Medical Library to be built by the Wayne State University School of Medicine. The project will be financed by a $1,432,246 grant by the Public Health Service of the U. S. Department of Health, Education and Welfare, a $500,000 gift from Abraham Shiffman through the Shiffman Foundation and $200,000 raised by the WSU medical alumni. Part of the alumni contribution will pay for furnishings, equipment and books.

The building will be located on the southwest corner of Brush and Canfield, near the medical school's Research Building and the Basic Science Building now under construction. Both Brush and Canfield will be closed and converted to pedestrian malls when the Medical Center is further developed.

Several physicians have worked to raise contributions for the new library through the Wayne University Medical Library Inc. headed by John Webster, M.D., fund chairman. Officers of the corporation are Drs. Edward M. Vardon, president; Don W. McLean, vice president; William J. Stapleton, Jr., treasurer; J. Courtney Fremont, assistant treasurer and Edgar C. Long, secretary. Alumni Director Homer D. Strong is assistant treasurer and resident agent.

BEEMAN, WILLIS ON HEART FORUM

Carl B. Beeman, M.D., of Grand Rapids, president of the Michigan Heart Association, moderated a public forum called "Hope For Your Heart" on Friday evening, May 10, at Ford Auditorium in Detroit, during the annual meeting of the Michigan Heart Association.

One of the speakers on the panel, co-sponsored by the Detroit *Free Press,* was Park W. Willis, III, M.D., professor of medicine at the University of Michigan Heart Station. Doctor Willis spoke on "Rheumatic Fever; High Blood Pressure."

The Nineteenth Annual Scientific Session of the MHA was well attended May 10-11 at the Rackham Memorial Building. Program participants included Michael C. Kozonis, M.D., Pontiac; Joseph N. Schaeffer, M.D., Detroit, and Henry H. Swain, M.D., Ann Arbor.

HEUSTIS, DANTO SPEAK AT ALMA CONFERENCE

MSMS was co-sponsor of a Physician-Clergy Workshop at Alma College on May 2 for Michigan clergy and physicians.

Physician speakers were Albert E. Heustis, M.D., director of Michigan Regional Medical Program and Bruce L. Danto, M.D., director of the Community Psychiatry Program for the Detroit Psychiatric Institute.

Keynote speaker was Rev. Robert B. Reeves, Jr., chaplain at Columbia-Presbyterian Medical Center in New York City.

DSA Hears Shumway

Over 200 physicians, members of the Detroit Surgical Association, heard Norman F. Shumway, Jr., M.D., who has done two heart transplants, speak on "Transplantation of the Heart," in Detroit on May 8. Doctor Shumway, professor of surgery at the Stanford School of Medicine, spoke at the DSA annual banquet.

Enduron: (methyclothiazide) A basic building block for mild hypertensives

METHYCLOTHIAZIDE
No. 6812
ENDURON®
METHYCLO-
THIAZIDE
5 mg

Excellent day-long Na⁺ output, yet easy on the K⁺

Enduron provides an excellent starting therapy. Your patient's sodium excretion is greatly enhanced. Yet potassium loss is low.

The therapeutic action is smooth, and persists for a full 24 hours. With Enduron you can prescribe convenient once-a-day dosage without skimping your patients on day-long thiazide effectiveness

Of course, as with all thiazides, supplemental dietary potassiur should also be considered.

Use Enduron as a basic therapy in patients with mild to moderate hypertension. A single 5-mg. tablet each day is ample ir most cases.

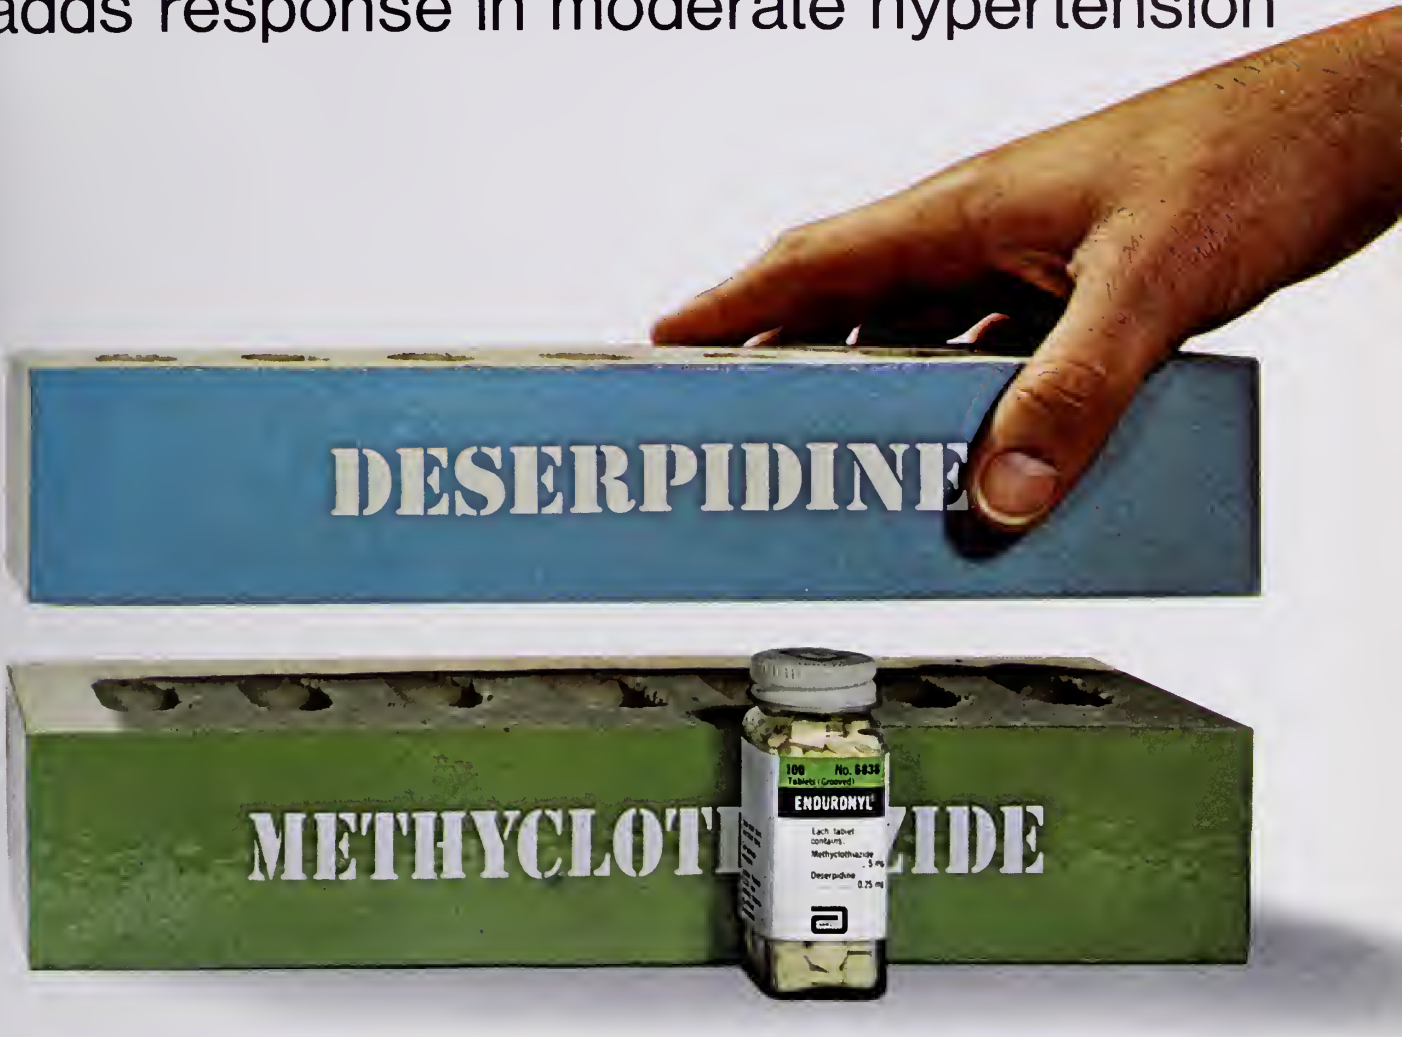
Once a day, every day

ENDURON®

METHYCLOTHIAZIDE

See Brief Summary on final page of advertisement

Enduronyl: Its deserpidine component adds response in moderate hypertension



DESERPIDINE
METHYCLOTHIAZIDE
100 No. 6835
Tablets (Grooved)
ENDURONYL
Each tablet contains:
Methyclothiazide 5 mg
Deserpidine 0.25 mg

Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 mg. with
DESERPIDINE 0.25 mg. or (FORTE) 0.5 mg.

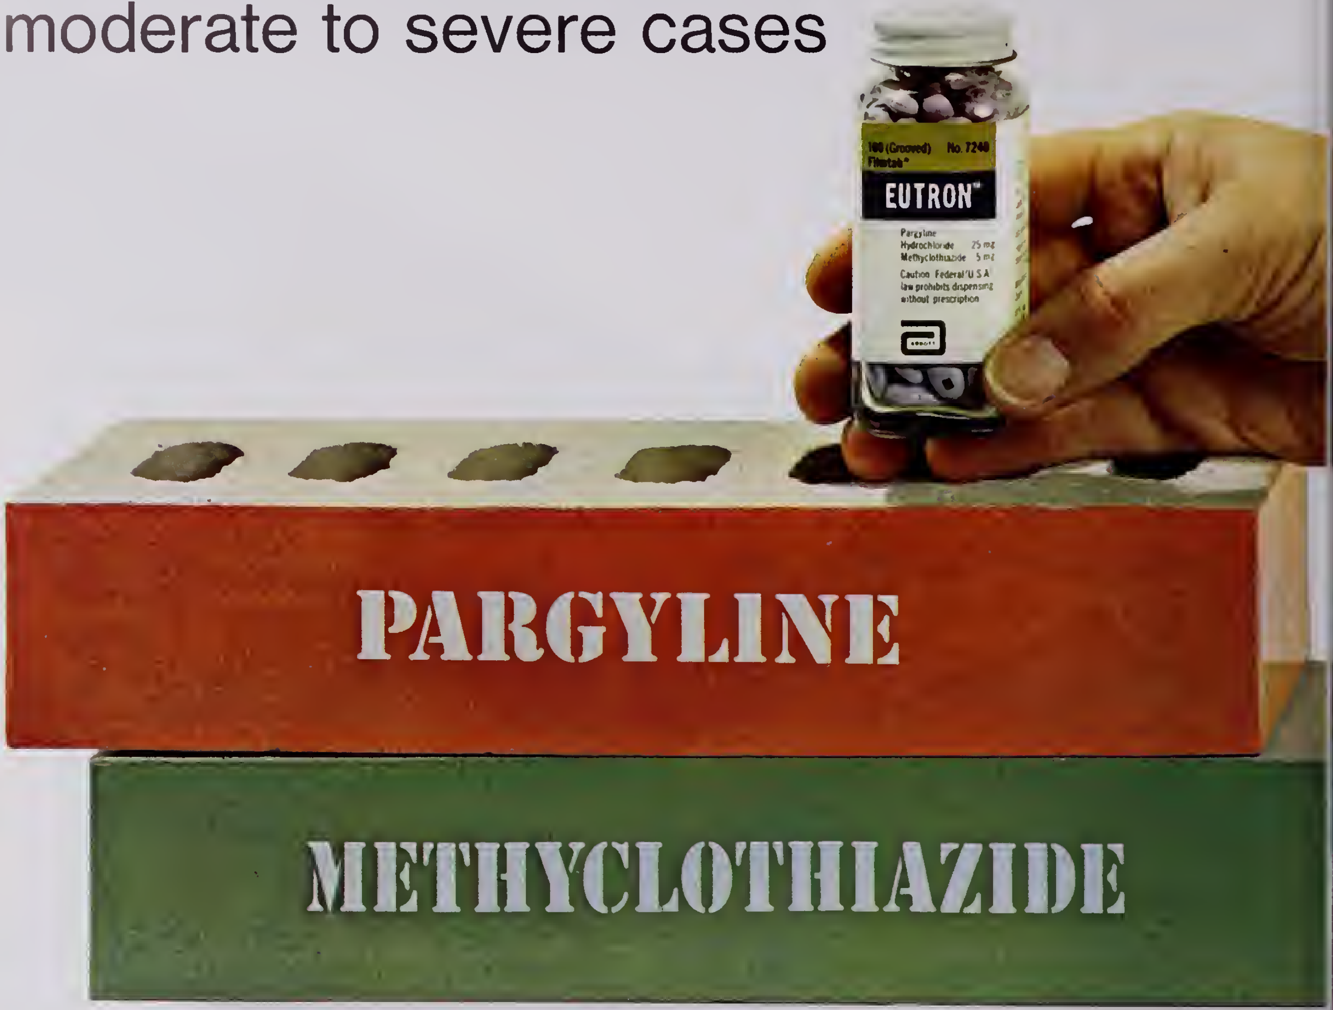
801094

Eutron: A unique combination for handling moderate to severe cases



100 (Grooved) No. 7240
Filmtab®
EUTRON®
Pargyline Hydrochloride 25 mg
Methyclothiazide 5 mg
Caution Federal/U.S.A. law prohibits dispensing without prescription
PARGYLINE
METHYCLOTHIAZIDE

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether your patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings were reduced from 112 pre-treatment to 90 post-treatment; *sitting* from 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearly alike in all three body positions.

Use Eutron for managing your moderate to severe cases. Its building blocks enhance each other; hence lesser doses often suffice.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

MILD
TO
MODERATE
TO
SEVERE

See Brief Summary on final page of advertisement

801094

ENDURON®

METHYCLOTHIAZIDE

ENDURONYL®

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications—Moderate to severe hypertension.

Contraindications—Pheochromocytoma, paranoid schizophrenia, hyperthyroidism and advanced renal failure. Not recommended in malignant hypertension, children under 12, pregnant patients.

Do not use with: centrally or peripherally acting sympathomimetic drugs; foods high in tyramine (e.g., aged and natural cheeses); parenteral reserpine or guanethidine; imipramine, amitriptyline, desipramine, nortriptyline or their analogues; other monoamine oxidase inhibitors; methyldopa or dopamine; separate Eutron and these agents by two weeks.

Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease; impending hepatic coma from thiazide-induced hypokalemia.

Warnings—Patients: 1. No other drugs (particularly "cold preparations" and antihistamines), cheese or alcohol without physician's consent. 2. Promptly report orthostatic symptoms, severe headache, other unusual symptoms. 3. Angina pectoris or coronary artery disease patients must not increase physical activity with improved anginal symptoms or well-being.

Physicians: 1. Use antihistamines, hypnotics, sedatives, tranquilizers and narcotics (meperidine contraindicated) cautiously in reduced doses. 2. Stop Eutron two or more weeks before elective surgery; in emergency surgery reduce premedication (narcotics, sedatives, analgesics, etc.) to 1/4 to 1/5; carefully adjust anesthetic dosage to patient response. 3. Use cautiously in advanced renal failure. 4. Pargyline may induce hypoglycemia. 5. Consider possible sensitivity reactions when a history of allergy or asthma is present. 6. If potassium is indicated, dietary supplement is recommended; enteric-coated potassium tablets may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation frequently requiring surgery; discontinue medication immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs; Eutron does not contain added potassium. 7. Possible systemic lupus erythematosus has been reported for thiazides.

Precautions—Pargyline: Use cautiously at reduced dosage: caffeine, alcohol, antihistamines, barbiturates, chloral hydrate, other hypnotics, sedatives, tranquilizers, narcotics. Periodically do urinalyses, blood counts, liver function tests, etc. Use with caution in liver disease. Watch for orthostatic hypotension, especially in impaired circulation (e.g., angina pectoris, coronary artery disease, cerebral arteriosclerosis); also, augmented hypotension in concomitant febrile illnesses. Reduce or discontinue if hypotension is severe. In impaired renal function watch for cumulative drug effects, elevated BUN and other evidence of progressive renal failure; withdraw drug if these persist. In surgery increased central depressant response (hypotension and increased sedative effect) can be controlled by (1) discontinuing at least two weeks prior; (2) in emergency surgery lowering dose of premedication; (3) when necessary, administering a vasopressor. Do not use in hyperactive and hyperexcitable patients. Pargyline may unmask severe psychotic symptoms where emotional problems pre-exist. Use cautiously in Parkinsonism, especially with antiparkinsonian agents. In prolonged therapy, examine for change in color perception, visual fields, fundi and visual acuity. Also, prolonged therapy has made certain patients refractory to nerve blocking effects of local anesthetics.

Methyclothiazide: Use cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery thiazide may reduce vasopressor response and increase tubocurarine response. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia). Give supplemental chloride if hypochloremic alkalosis occurs and supplemental potassium if hypokalemia occurs (especially in digitalized patients). Thiazides may decrease serum P.B.I. without signs of thyroid disturbance.

Adverse Reactions — Pargyline: Orthostatic hypotension and associated symptoms, mild constipation, fluid retention, edema, dry mouth, sweating, increased appetite, arthralgia, nausea, vomiting, headache, insomnia, difficult in micturition, nightmares, impotence, delayed ejaculation, rash, purpura, weight gain, hyperexcitability, increased neuromuscular activity and other extrapyramidal symptoms. Drug fever is extremely rare. Reduction in blood sugar and hypoglycemic effects are possible. Congestive heart failure has been reported in a few patients with reduced cardiac reserve.

Methyclothiazide: Blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, blood sugar or serum uric acid (gout may be induced); anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice and pancreatitis. Cutaneous vasculitis in elderly patients has been reported with other thiazides.

If side effects are severe or persist, reduce dosage or withdraw drug. 804438R

COMING EVENTS

COLLER-PENBERTHY-THIRLBY EVENT SET AT TRAVERSE IN JULY

All Michigan physicians are invited to participate in the 48th Annual Coller-Penberthy-Thirlby Medical Conference at Traverse City, July 25-26.

The excellent program will begin at 9:00 a.m., July 25 and conclude at noon, July 26, according to James W. Hall, M.D., local chairman of the committee on arrangements. He reports that the "fine program has been prepared by A. James French, M.D., University of Michigan Medical School, and his associates."

Michigan physicians who have been selected to speak include Alexander J. Walt, M.D., Clifford D. Benson, M.D., G. Thomas McKean, M.D., T. N. Evans, M.D., all of Detroit; William D. Robinson, M.D., Harold A. Oberman, M.D., Edgar A. Kahn, M.D., Walter P. Work, M.D., Stuart M. Finch, M.D., William J. Oliver, M.D., Arthur C. Curtis, M.D., F. Bruce Fralick, M.D., Robert B. Sweet, M.D., all of Ann Arbor; Allen J. Enelow, M.D., Scott N. Swisher, M.D., both of East Lansing; and Warren W. Cline, M.D., Traverse City.

Out-of-state medical educators will come from California, Ohio, Florida, Missouri, Maryland, Nebraska, Minnesota, Texas, and Illinois.

Further details will appear in future issues of *Michigan Medicine.* ☐

Offer Career Guide

MSMS has inserted eight pages of Michigan information in a new AMA "Horizons Unlimited" career pocketbook for distribution to school counselors, libraries, youth-serving agencies and others who guide and counsel young people. The booklet describes the "Challenge of Medicine" and suggests that there are "vast new medical horizons opening up as the result of promising experiments in transplantations." The booklet is distributed by the MSMS Public Relations Committee. Interested MSMS members may obtain a copy of the booklet for reference use in their reception rooms by writing to MSMS, 120 West Saginaw, East Lansing, 48823.

OFFER NUCLEAR RADIATION DETECTION COURSE AT U-M

An intensive two-week course in Nuclear Rediation Detection for Medical and Health Scientists will be offered for the first time July 8-19 by the University of Michigan College of Engineering. The introductory lecture and laboratory course is designed to provide a working familiarity with devices and techniques used in the measurement of ionizing radiation. Emphasis is placed on the fundamental principles of detector devices, with examples of their application in radiological health, nuclear medicine, radiology, and related fields.

Further information may be obtained by writing to: Engineering Summer Conferences, Chrysler Center, North Campus, The University of Michigan, Ann Arbor 48105. ☐

MSU Museum Seeks Medical Books, Items

Val Barryman, curator of historical artifacts at the Michigan State University Museum, announced recently that the museum is interested in expanding its collection of medical items.

"We are especially interested," Mr. Barryman said, "in medical instruments, medical books and journals, and doctor's personal records, diaries, or photographs prior to 1930."

Physicians who would like to donate such items can write to Mr. Barryman at the Michigan State Museum in East Lansing. ☐

Is it depression?

She says "I'm always on edge..."

...but her other symptoms: depressed mood, insomnia, anorexia, feelings of guilt strongly suggest an underlying depression.

---

when the diagnosis is depression

ELAVIL® HCl

AMITRIPTYLINE HCl

Indications: Mental depression and mild anxiety accompanying depression.

Contraindications: Glaucoma and predisposition to urinary retention. Not recommended in pregnancy.

Precautions and Side Effects: Drowsiness may occur within the first few days of therapy. Patients should be warned against driving a car or operating machinery or appliances requiring alert attention. When depression is accompanied by anxiety or agitation too severe to be controlled by ELAVIL HCl alone, a phenothiazine tranquilizer may be given concomitantly. Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having varying modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Monoamine oxidase inhibitor drugs may potentiate other drugs and such potentiation may even cause death; permit at least two weeks to elapse between administration of two agents; in such patients, initiate therapy with ELAVIL HCl cautiously with gradual increase in dosage required to obtain a satisfactory response. Caution patients about errors of judgment due to change in mood, and that the response to alcohol may be potentiated. May provoke mania or hypomania in manic-depressive patients.

Side effects include drowsiness; dizziness; nausea; excitement; hypotension; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of schizophrenia which may require phenothiazine tranquilizer therapy; epileptiform seizures in chronic schizophrenics; temporary confusion, disturbed concentration or, rarely, transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of the mouth, blurring of vision, urinary retention, constipation; paralytic ileus; jaundice; agranulocytosis.

Careful observation of all patients is recommended. The antidepressant activity may be evident within 3 or 4 days or may take as long as 30 days to develop adequately, and lack of response sometimes occurs. Response to medication will vary according to severity as well as type of depression present. Elderly patients and adolescents can often be managed on lower dosage levels.

Supplied: Tablets ELAVIL HCl, containing 10 mg., 25 mg., and 50 mg. amitriptyline HCl, bottles of 100 and 1000; Injection ELAVIL HCl, in 10-cc. vials, containing per cc.: 10 mg. amitriptyline HCl, 44 mg. dextrose, 1.5 mg. methylparaben, and 0.2 mg. propylparaben.

Before prescribing or administering, read product circular with package or available on request.

ACTIVITIES, PROJECTS

MSMS CANCER COMMITTEE URGES PAP TEST

The MSMS Cancer Committee continues to urge women to have a Pap Test to help reduce the predicted 300 deaths in Michigan from Cervical Cancer.

The Cancer Committee, which estimates that only 18 per cent of the adult women in Michigan have ever had a Pap Test, recently pushed the campaign through the Michigan press. A MSMS News Release was carried by many papers. The following headlines, tipical of many, carried the MSMS message:

Grand Haven Tribune: *"Women Reminded Cancer Tests Needed Yearly"*

Utica Daily Sentinel: *"Simple Pap Cancer Test Prevents Many Needless Deaths of Women"*

Greenville Daily News: *"Women Urged to Get Pap Test"*

Escanaba Daily Press: *"Women Neglecting Cancer Protection"*

Petoskey News-Review: *"Women Must Become Aware of Pap Tests"*

MSMS Health Award Honors State PTA

The Michigan Congress of Parents and Teachers (PTA) recently received an Outstanding Health Service Award from MSMS at the state PTA convention in Battle Creek on the occasion of the organization's 50th Anniversary.

The MSMS citation to the PTA was "for distinguished leadership in Michigan during 50 years of service in helping parents and children study and adopt good health practices," and especially "for current PTA programming in such critical health areas as family life and sex education, smoking and health, and others." The award, presented by George W. Slagle, M.D., Battle Creek, also "pledged the continuing cooperation of Michigan doctors of medicine as consultants and program participants during the next half century in the PTA voluntary approach to further improve the family, school, and community."

Recommended by The MSMS Award Committee, the citation was approved by The MSMS Council.

Left to right, Rep. Warren N. Goemaere, of Roseville, Herbert A. Raskin, M.D., Chairman of MSMS Committee on Alcoholism and Drug Dependence, and Rep. Dale Warner of Eaton Rapids, discuss narcotics legislation pending in the State Capitol. Both State Representatives are members of committees dealing with alcoholism or narcotics and Mr. Warner chairs a special study group in this area.

When toddler appetites rebel,

new Gerber® Toddler Meals assure nutrition.

Developed especially for toddlers

These new products were specifically developed to meet the needs of children graduating from baby foods. Combining convenience, texture and grown-up taste appeal with sound nutrition, Gerber research has created Toddler Meals in ten tasty varieties.

Superior nutrient/ calorie ratios

The nutritional characteristics of these casserole meals are excellent. High in critical nutrients, Gerber Toddler Meals are the answer to the problem of empty calories.

Excellent protein value

Gerber Toddler Meals contain 1½ to 3 times the high quality protein per calorie specified by the NRC Recommended Daily Dietary Allowance. Iron, thiamine, riboflavin, niacin and ascorbic acid also rate well above the Recommended Allowance per calorie for these nutrients.

New chewing satisfaction

Made with tender, bite-size morsels of meat, prepared by an exclusive Gerber process, they offer chewing satisfaction, yet are easily ingested and digested with light mastication.

Now when mothers ask your advice, consider this new step from baby foods to adult foods for assured nutrition.

Gerber Products Company, Fremont, Michigan 49412

VIEWPOINTS

Thank You, George; Best Wishes, John

BY BROOKER L. MASTERS, M.D., CHAIRMAN, MSMS PUBLICATION COMMITTEE

This issue of *Michigan Medicine* really has two Scientific Editors as George H. Lowrey, M.D., leaves the post and John W. Moses, M.D., begins his service.

The MSMS Council, at its last meeting, unanimously passed a motion to thank Doctor Lowrey for his outstanding service as the Scientific Editor since April, 1966. He had submitted his resignation because of new responsibilities at the University of Michigan Medical School.

Doctor Lowrey, during his term, provided fine scientific papers for the MSMS membership. Many of these he actively recruited by encouraging physicians to especially develop original scientific articles for *Michigan Medicine*. As a professor of pediatrics at Ann Arbor, he had many contacts with the medical educators; and he had many relationships across the state with practicing physicians through his lectures to county medical societies and hospital staffs.

□ □

The new editor, Doctor Moses is director of medical education at Mt. Carmel Hospital in Detroit and well qualified to serve as the Scientific Editor. He received his medical degree from Boston University and has practiced in Michigan since 1954. He was in private practice until joining Mt. Carmel several years ago.

LOWREY

MOSES

Doctor Moses is an associate editor of the *Detroit Medical News* and has written for many medical publications. He is very active in the Wayne County Medical Society and is one of the WCMS delegates to the MSMS House of Delegates.

The Publication Committee, and The Council, sincerely thank Doctor Lowrey for his contributions to medical postgraduate education in Michigan, and also wish Doctor Moses well as he continues to improve the quality of the scientific articles in *Michigan Medicine*.

The Constant Search

BY MILTON ROUSE, M.D.
AMA PRESIDENT

In all fields of endeavor, there is a never-ending look for new and better ways to nourish man's progress and kindle his hopes for a more perfect existence.

But perhaps nowhere is this endless search more passionate and more meticulously checked and rechecked than in medical science.

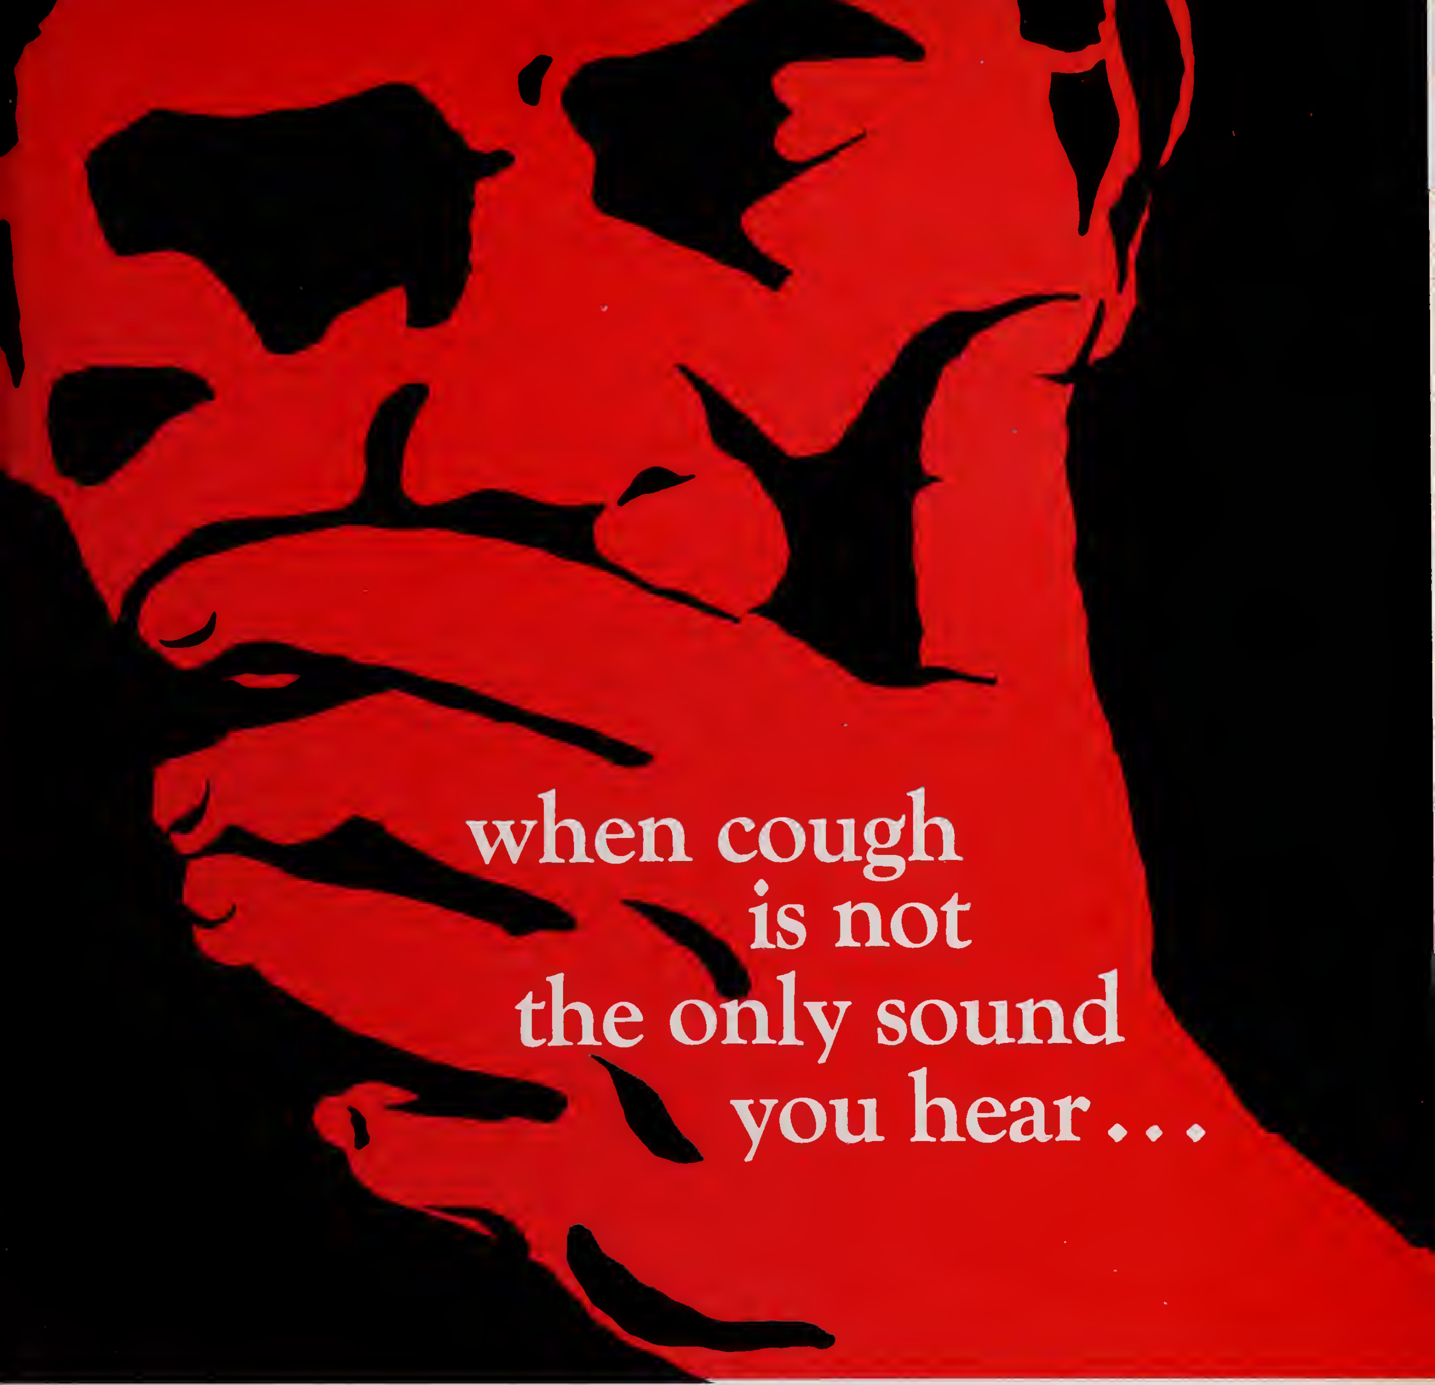
And nowhere are the bounteous fruits of this quest more evident than at the AMA Annual and Clinical Conventions, remarkable scientific spectacles without equal and a living tribute to all who have made personal contributions and sacrifices aimed at furthering the art and science of medicine.

Take the forthcoming 117th Annual Convention in San Francisco June 16-20, for example. This vast panorama of all that is current in every area of medicine will beckon more than 60,000 persons, all of whom will be drawn closer to the heartbeat of medicine and its eternal promise just by being a part of it.

At least 16,000 of them will be physicians taking advantage of a remarkable educational opportunity which will enable them collectively and individually to learn and implement proven methods and techniques destined to further improve the quality of medical care not only for Americans, but for people everywhere.

Indicative of the quality, scope and thoroughness of the Scientific Program in which they will participate is the fact that more than 2,000 men

(Continued on 767)



OMNI-TUSS® b.i.d.

. . . because OMNI-TUSS is indicated for cough associated with upper respiratory tract infections, bronchitis, bronchiectasis, bronchial asthma, emphysema, sinusitis and rhinitis, hay fever, or other allergic conditions. Any of these conditions may exhibit the general symptom syndrome—coughing, wheezing, bronchospasm, and tenacious mucus—which may benefit from the antitussive, bronchodilative, antihistaminic, and expectorant action of Omni-Tuss.

The therapeutic usefulness of Omni-Tuss is enhanced by a unique resin complex formulation providing the clinically desirable advantages of: (1) uniform drug availability throughout an extended period, (2) 8 to 12 hours of symptomatic control, (3) minimal dosage requirement, (4) minimal side effects.

Economical, efficient **b.i.d.** dosage—extremely well-tolerated by children, 6-12, and adults.

'Omni Tuss' Suspension: Each teaspoonful (5 cc.) contains 10 mg. codeine (Warning: May be habit-forming), 5 mg. phenyltoloxamine, 3 mg. chlorpheniramine, 25 mg. ephedrine, all as cation exchange resin complexes of sulfonated polystyrene, and 20 mg. guaiacol carbonate.

Available on prescription only. Class X exempt narcotic. Permissible on oral prescription.

Dosage: *Adults:* 1 teaspoonful (5 cc.) q12h.
Children (6-12 *years*): ½ teaspoonful q12h.

Side Effects: Minimal, but when encountered may include jitteriness, nausea, drying of mouth, insomnia, constipation, which disappear upon adjustment of the dose or discontinuance of treatment.

Precautions and Contraindications: For complete detailed information, refer to package insert or official brochure.

Now . . . a new
alternate salicylate product
from Warren-Teed

Magan®
(magnesium salicylate, W-T)

particularly offered for the management of those chronic arthritic and rheumatic patients with gastrointestinal intolerance to aspirin and other salicylates

magan®

an alternate salicylate

pain relief comparable to aspirin

Magan may provide effective salicylate therapy for a substantial number of your patients who cannot tolerate other salicylates because of gastrointestinal irritation.

Magnesium salicylate is recognized as a safe and effective alternate to aspirin. A controlled clinical study showed Magan to be not significantly different from aspirin as an analgesic in the treatment of arthritic patients.[1]

Reports from a private practice experience study indicate that Magan was tolerated by a high percentage of patients judged by their physicians to be unable to take aspirin or other salicylates due to gastrointestinal intolerance.[2]

1. Stern, S.B.: Med. Times, Oct. 1967
2. Reports on 1200 patients, data in files, Warren-Teed Pharmaceuticals, Inc. 1966

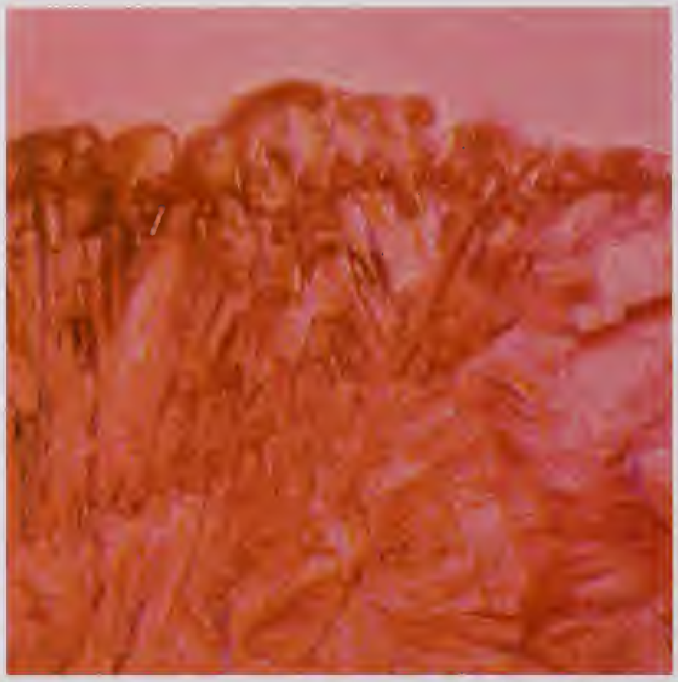
(See next page for prescribing information)

A different salicylate structure—
with no coating, no buffering
and it is sodium free

magan®

(Magnesium Salicylate, W-T)

microphotograph of magnesium salicylate crystals



Composition: Each orange-colored compressed tablet contains 5 grains (approximately 325 mg.) of magnesium salicylate, W-T (salicylic acid equivalent 75%).

Actions, Indications, Uses: The analgesic, anti-inflammatory, and antipyretic effects of MAGAN are similar to those of aspirin and other salicylates. Accordingly, MAGAN is indicated for the treatment of rheumatoid arthritis, osteoarthritis, nonarticular rheumatism such as bursitis, painful-shoulder syndrome, tendosynovitis, fibrositis, and other musculoskeletal disorders. The drug is also useful for the symptomatic relief of pain, aches, and discomfort of headache, neuralgia, minor injuries, dysmenorrhea, common cold and other minor infections of the respiratory tract. MAGAN (Magnesium Salicylate) may be tolerated by some persons intolerant to aspirin by reason of gastrointestinal irritation.

Contraindications: Because of the danger of hypermagnesemia, MAGAN is contraindicated in cases involving advanced chronic renal insufficiency. MAGAN, as other salicylates, may counteract the effect of uricosuric agents, and should not be prescribed for patients on such drugs.

Warning: As with all salicylates, high dosages of MAGAN should be avoided entirely or administered with caution to patients with liver damage, preexisting hypoprothrombinemia, vitamin K deficiency, and before surgery.

Adverse Reactions and Precautions: The same precautions applicable to salicylate therapy in general should be followed in prescribing MAGAN. Appropriate precautions should be taken in prescribing MAGAN for persons known to be sensitive to salicylates. If reaction develops, drug should be discontinued. Dosages of anticoagulants should be reduced with the administration of high dosage levels of MAGAN. *Impaired Renal Function:* Appropriate precautions should be taken in administering MAGAN to patients with any impairment of renal function including discontinuing other drugs containing magnesium and monitoring serum magnesium levels particularly if dosage levels of MAGAN are high. *Salicylate Poisoning:* Symptoms of salicylism, resulting from high doses of MAGAN, can be expected to resemble closely in character and intensity those associated with aspirin poisoning. These range from dizziness, drowsiness and ringing in the ears to vertigo, convulsions, coma and hypokalemia. Salicylate poisoning can be treated by intravenous fluids with sodium bicarbonate or lactate and potassium supplementation. In very severe cases, hemodialysis may be necessary. Vitamin K, 5-20 mg. orally or slowly i.v., usually restores the prothrombin time to normal.

Dosage: Adults 1 or 2 tablets every 4 hours as required with a full glass of water. In arthritis and other rheumatic conditions, higher doses may be used at the discretion of the physician. The experience with MAGAN in children is limited. The drug should not be used, therefore, for patients below 12 years until indications for use and dosage have been established.

How Supplied: Bottles of 250 and 1000 tablets.

WARREN-TEED PHARMACEUTICALS INCORPORATED
COLUMBUS, OHIO 43215
SUBSIDIARY OF **ROHM AND HAAS COMPANY**

and women of eminence, of whom the overwhelming majority are physicians, will be presenting it.

Under the astute direction of the AMA's Council on Scientific Assembly, they have amassed the most timely and productive program possible. Its all-inclusiveness guarantees that it will contain subject matter beneficial to every physician, no matter what his area of medical practice or interest.

Among the highlights of the Scientific Program will be discussions, symposia, lectures, panels, exhibits, research reports, color television, and medical motion pictures — all featuring carefully studied, selective topics designed to spur continued learning among all participating physicians, particularly in those areas of greatest medical concern.

There will be more than 253 Scientific Exhibits, and physicians will have the opportunity to view 12 current medical motion pictures. Medical television again will be offered through the cooperation of Smith, Kline and French Laboratories.

Established in 1915 to supervise and coordinate the activities of the various Sections of the Scientific Assembly, the Council on Scientific Assembly has been persistent in its search to arrange the most effective Postgraduate Medical Education Program possible each year.

Let's Tell Them Thanks

Michigan Medicine invites the assistance of MSMS members to help show the advertisers that they are wise in selecting the MSMS journal.

Michigan Medicine, with the support of its advertisers, seeks to provide good original scientific papers and vital news articles about MSMS and about socio-economics-political-ethical topics.

Few members, we suspect, ever write a note of appreciation to an advertiser even though the reader may be fully aware of the support by the ethical firms.

The Publication Committee does formally express its sincere thanks several times a year through various ways. The Publication Committee also would hope that MSMS members would mention *Michigan Medicine* when visiting with detail men or when writing for complimentary products offered by the advertisers in the MSMS journal. Firms often use mail and coupon-returns as a measurement in placing future ads.

An unsolicited note of thanks, commendation, or even constructive criticism from Michigan doctors can be the greatest return for any advertisement published. Our advertisers would like to hear from you! BLM

Thyroid Ext. (1 gr.)	64 mg.
Glutamic Acid	50 mg.
Thiamine HCL	10 mg.

Dose: 1 or 2 tablets daily.
Available: Bottles of 60, 500.

Android-Plus
WITH HIGH POTENCY
B-COMPLEX AND VITAMIN C

Each white tablet contains:

Methyl Testosterone	2.5 mg.
Thyroid Ext. (¼ gr.)	15 mg.
Ascorbic Acid (Vit. C)	250 mg.
Thiamine HCL	25 mg.
Glutamic Acid	100 mg.
Pyridoxine HCL	5 mg.
Niacinamide	75 mg.
Calcium Pantothenate	10 mg.
Vitamin B-12	2.5 mcg.
Riboflavin	5 mg.

Dose: 2 tablet twice daily.
Available: Bottles of 60, 500.

also available with ESTROGEN

Android-E

Each Tablet Contains:

Methyl Testosterone	2.5 mg.
Ethinyl Estradiol	0.02 mg.
Thyroid Ext. (1/6 gr.)	10 mg.
Thiamine Hydrochloride	10 mg
Glutamic Acid	50 mg.

INDICATIONS: Advantage is taken of the anabolic action of ANDROID without its virilizing effect. Estrogen balances the androgen — only steroid effect remains. Geriatrics, post-operative and debilitating disease, osteoporosis. **DOSE**. One tablet t i d. Female patients should have a rest period 5 to 7 days after 21 days of medication. **SIDE EFFECTS**: In the female, excessive dosage may produce virilizing effects of most androgens hoarseness, hirsutism, enlarged clitoris. Symptoms can be avoided by keeping the dosage below 300 mg of testosterone per month. **CONTRA-INDICATIONS**. See Android. Ethinyl estradiol is not to be used in latent malignancy of reproductive organs or mammary glands.

Mead Johnson – pharmaceuticals created for your specialized clinical needs

She relies
on your
contraceptive
advice

She can expect to continue Oracon for years

ORACON®

16 White—Ethinyl Estradiol, 0.1 mg. Tablets; 5 Pink—Dimethisterone, 25 mg., and Ethinyl Estradiol, 0.1 mg. Tablets

Only 4.4% of patients taking Oracon discontinued it because of side effects

Oracon in a total conception-control program. Generally, withdrawal bleeding is comparable to her usual menstrual flow, even after prolonged use. Incidence of amenorrhea was less than 1% in original studies. Breakthrough bleeding occurred in only 1.5% of full cycles completed, and intractable monilial vaginitis was not reported.

Patients can continue Oracon comfortably. For years. Although a cause and effect relationship has been neither established nor disproved, alertness to the possibility of serious occurrences such as thromboembolism is necessary in any program with any oral contraceptive. Contraindications, medical ramifications, and long-range considerations in the use of Oracon, the same as those for all oral contraceptives, follow.

Mead Johnson also offers these important prerequisites for success in a conception-control program: information for the patient to help her understand conception control; and packaging to guide her in using the product correctly, according to your directions.

to guide you in prescribing Oracon

Indication: Oral contraception.

Effectiveness: Although some pregnancies have occurred while on therapy, oral contraception is the most effective method known.

Mechanism of Action: Gonadotropin suppression.

Contraindications: Thrombophlebitis, history of thrombophlebitis or pulmonary embolism; liver dysfunction or disease; known or suspected carcinoma of breast or genital organs; undiagnosed vaginal bleeding.

Warnings: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia, or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. Since the safety of Oracon in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this to the infant has not been determined.

Precautions: The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. Endocrine and possibly liver function tests may be affected by treatment with Oracon. Therefore, if such tests are abnormal in a patient taking Oracon, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of estrogen-progestogen preparations, pre-existing uterine fibromyomata may increase in size. Because these agents may cause some degree of fluid retention, conditions that might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. Oracon should be used with caution in patients with a history of cerebrovascular accident. In relation to breakthrough bleeding, as in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Oracon therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Oracon therapy. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. Because of the effects of estrogens on epiphyseal closure, Oracon should be used judiciously in young patients in whom bone growth is not complete. The age of the patient constitutes no absolute limiting factor, although treatment with Oracon may mask the onset of the climacteric. The pathologist should be advised of Oracon therapy when relevant specimens are submitted.

Side Effects: The following adverse reactions have been

continued on next page

observed in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post-partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression. Although the following have been reported as side effects in users of oral contraceptives, no cause and effect relationship has been established: anovulation post-treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, itching. Post-marketing experience with ORACON has revealed that hypermenorrhea and acne may also occur. The following occurrences have been observed in users of oral contraceptives. A cause and effect relationship has neither been established nor disproved: thrombophlebitis, pulmonary embolism, neuro-ocular lesions. The following laboratory results may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests; coagulation tests (increase in prothrombin, Factors VII, VIII, IX, and X); thyroid function (increase in PBI and butanol extractable protein bound iodine and decrease in T^3 values); metyrapone test; pregnanediol determination.

Administration: Counting onset of menses as Day 1, the patient starts medication on Day 5 of the cycle and takes one white tablet daily from Day 5 through Day 20, then one pink tablet daily from Day 21 through Day 25. Patients should be cautioned to follow the dosage schedule strictly. Evening administration is suggested. An additional contraceptive method is recommended for the first 7 tablet days of the first cycle of ORACON usage. If the regimen is interrupted, for the fullest possible protection an additional contraceptive method is recommended for the rest of the cycle. If flow should not occur by the 7th day after taking the last pink tablet, the next course of therapy should be initiated on that day, thereby allowing 6 full days without medication. Some physicians prefer to stipulate that the patient never allow more than 6 unmedicated days to elapse between cycles regardless of the time of onset of withdrawal bleeding. If two consecutive periods are missed, the possibility of pregnancy should be considered and the patient should report to the physician. However, pregnancy should be suspected at the first missed period if the patient has deviated from instructions. For those few occasions when breakthrough bleeding occurs, the following recommendations are made: (a) Spotting. Continue medication. (b) Menstrual-type flow. Discontinue medication and begin a new medication cycle on the fifth day. Because of the rarity of frank breakthrough bleeding, especially after the first few cycles, it is not necessary to provide the patient with additional tablets to allow for doubling the dose. Recurring breakthrough bleeding, particularly after the first few cycles, should be reported to the physician for further investigation. Because of the common occurrence of increased cervical mucus, it is recommended that the patient be apprised of this possibility.

Availability: ORACON is available as 16 white and 5 pink tablets. Each white tablet contains 0.1 mg. of ethinyl estradiol; each pink tablet contains 25 mg. of dimethisterone and 0.1 mg. of ethinyl estradiol. Each month's supply includes patient instructions. Complete details on ORACON are available from Mead Johnson Laboratories.

to guide her in understanding and using conception control

A discussion of conception control for brides, "To Plan for a Lifetime, Plan with Your Doctor," is one of several booklets available through your Mead Johnson representative or directly from Mead Johnson Laboratories.

The Need for Utilization Review

BY LOUIS F. HAYES, M.D.
VICE PRESIDENT
MEDICAL AFFAIRS DIVISION
MICHIGAN MEDICAL SERVICE

"What is Utilization Review?"

The objective of this article will be to provide a simple definition of utilization review. I hope we can make it more explicit than one definition given: "a word of French and Latin derivation, containing 11 letters, whose use in medical circles often causes a vulgar Anglo-Saxon response"; yet I do not want to be as vague as another definition: "striving to reach a goal as yet undescribed, using methods as yet undefined and involving all concerned parties in roles as yet undetermined."

Let's begin with the basic definition of each of these two words. Utilization is "the act of making use of"; review is "to look at again — to look back on — to take a retrospective view." Now let us take a small liberty with these definitions by expanding them a bit to encompass medical services. To do this we need only to add the word "good"; thus our end result is "looking back at making good use of."

To utilize (there's that word again) this definition in terms of health care, we should ask ourselves three questions:

1. What do we look back at?
2. What does it mean?
3. What can we do with the information?

What do we look back at?

To measure utilization of medical services we need only concern ourselves with incidence of services. Tabulation of the frequency of items of all kinds, hospital days, surgical procedures, diagnostic procedures, office and home visits would provide an impressive array of statistics. Another dimension should then be added — patient information, such as age, sex, location and diagnosis. Such items then become the raw material for utilization review.

What does it mean?

Establishing relationships between the above mentioned items would give us patterns of use by environment, profiles of practice by providers and utilization by patient. Interpretation is another matter; the mathematical relationships could be subjected to statistical analysis, but a more significant interpretation requires medical judgment. Only physicians can suggest with relationship, which patterns, which profiles have sufficient medical significance to make them reasonable indicators of medical quantity. And it necessarily follows that only physicians can examine these quantitative factors and draw conclusions relative to the quality of care.

What do we do with the information?

Obviously, information is of little use unless it can be used in a practical manner. Ultimately, utilization statistics should have the function of improving the use of and quality of medical care. To effect this, we delete the word "review" and substitute a more onerous word, "control."

The responsibility for control in the area of quantity belongs to the carrier and the physicians (both inside and outside the carrier structure). When data reveals misuse, the fiscal responsibility of the carrier dictates appropriate action. Detection of over-utilization calls for a joint effort, the carrier in identifying, physicians in correcting.

Control of the quality of medical care is another matter. In this endeavor, the carrier serves

AUTHOR:
HAYES

First in New Series of Articles:

The following article is the first of a series to be prepared for publication in *Michigan Medicine* by the staff of Michigan Medical Service. Future articles will deal with the following topics:

The Need for Utilization Review
Utilization Review Systems-Characteristics and Operation
Measurement of Quality and Quantity of Medical Services
Role of Non-Physician in Utilization Review
Role of Physician in Utilization Review
Michigan Utilization Review Project

primarily an educational function; as the reservoir of raw data and, because of computer capacity, they should be responsible for the preparation of information — they "review." "Control" requires medical judgment and appropriate corrective measures; heavy physician involvement is needed to do this effectively. Since physicians have the right to medical judgment in the quality of medical care, they have also the obligation of correction when poor quality is detected.

The charge will probably be made that I have over-simplified this matter — but I have a compulsion to reduce problems to simple terms. It would seem elemental that the carrier, as the source of data, be responsible for arraying the statistics — and equally fundamental that the physicians are the only ones capable of making judgments on the quality of care. But a more important point is that this should be a mutual endeavor, with divided responsibilities but a common goal — providing the best medical care at the lowest possible cost. □

Health Council, Consumer's Publish Booklet to Help Recruit Doctors to State

The Michigan Health Council, in cooperation with Consumers Power Company of Jackson, is distributing a new brochure designed to attract family physicians to practice medicine in rural areas of Michigan.

The booklet gives large emphasis to the natural beauties of Michigan, the excellent medical facilities in the state and the personal testimony of several Michigan physicians who have found rural practice rewarding.

"I have had more than fifteen years of family practice in a typical small community in Michigan," writes Brooker L. Masters, M.D., of Fremont. "During this time, I have enjoyed a most rewarding professional life, as well as a most desirable community in which to live with my wife and children."

"Not only baby, but parents, grandparents, aunts, and uncles have been an integral part of the mosaic of my life as a family doctor in a small community," says R. W. Spalding, M.D., of Bloomingdale.

"Here, the pace of living has been slow enough to allow time for growing up with my family and, at the same time, be a respected and esteemed member of every other family in the community. A source of great personal satisfaction has been the opportunity to help guide so many lives from babyhood to childhood into the teen years and on through adulthood," Doctor Spalding concludes.

Ten thousand copies of the brochure have been printed and are being distributed throughout the U.S. to physicians who have expressed interest in Michigan as a place to establish practice.

"We also have distributed copies to the medical schools," comments John A. Doherty, Executive Director of the Michigan Health Council. "The booklets will be given to freshmen, sophmore, and junior medical students so that early in their career they will become aware of the great potential in rural medical practice."

Ben N. Saltzman, M.D., A.M.A. Chairman of the Council on Rural Health, also comments in the booklet: "I enjoy knowing people and their families. I like being treated as a member of a family and at the same time held in a position of respect and esteem. My philosophy of life is a simple one—freedom from financial care; good health and adequate educational opportunities for my children; and a position of prestige for my wife and myself in a community. This, in essence, is the recompense for family practice—and what I have enjoyed for 21 years."

"We all enter the field of medicine with personal dedication," Doctor Saltzman concludes. "Through rural family practice in an uncomplicated, straight-forward and appreciative environment, I have realized the fulfillment of those early dreams." □

When it's more than a bad cold

your patient can feel better while he's getting better

Achrocidin®

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen citrate 25 mg.

In bacterial/allergic u.r.i., ACHROCIDIN brings the treatment together in a single prescription—prompt relief of headache and congestion together with effective control of the tetracycline-sensitive organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN (Tetracycline) equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals.
Contraindications: History of hypersensitivity to any component.
Warning: If renal impairment exists, even usual doses may lead to liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. Hypersensitive individuals may develop a photodynamic reaction to natural or artificial sunlight during use. Individuals with a history of photosensitivity reactions should avoid direct exposure while under treatment, which should be discontinued at first evidence of skin discomfort.
Precautions: Some individuals may experience drowsiness, anorexia, and slight gastric distress. If excessive drowsiness occurs, it may be necessary to increase the interval between doses. Persons on full dosage should not operate any vehicle. Use may result in overgrowth of nonsusceptible organisms. If infections appear during therapy, appropriate measures should be taken. Infections caused by beta-hemolytic streptococci should be treated for at least 10 full days to help prevent rheumatic fever or acute glomerulonephritis. Use of tetracycline during tooth development may cause discoloration of teeth.
Adverse Reactions: Gastrointestinal—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes (a case of exfoliative dermatitis has been reported); photosensitivity; onycholysis and discoloration of nails (rare). Kidney—rise in BUN, apparently dose related. Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. In young infants, bulging fontanels following full therapeutic dosage has been reported. This has disappeared rapidly when drug was discontinued. Teeth—dental staining (yellow-brown) in children of mothers given tetracycline during the latter half of pregnancy and in children given the drug during the neonatal period, infancy, and early childhood. Enamel hypoplasia has been seen in a few children. Blood—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. Liver—cholestasis (rare), usually at high dosage. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

...progress in protection

Blue Shield's new Variable Fee and Extended Benefits program protects both patients *and* physicians against the unpredictabilities of fluctuating costs. A progressive movement in voluntary prepayment plans, the new program will need your support.

Remember, as a Blue Shield participating physician, you're serving the best interests of your patients *and* yourself.

MICHIGAN BLUE SHIELD ®

A booklet describing this program in complete detail has been mailed to all physicians in Michigan. If you did not receive it, or if you have any questions, write Michigan Blue Shield, or contact your local Professional Relations representative.

What Is Current Thrust of MSMS In Areas of National, International Affairs?

Where does MSMS stand regarding national and international affairs?

That provocative question is one of 13 different subjects covered in a new MSMS workbook "Where Does MSMS Stand?" being studied by members of the MSMS House of Delegates and The Council.

Each of the 13 chapters is discussed, answering the question, in a discussion section, "What is the current thrust of MSMS and how are we doing?"

The workbook will serve as guidelines for the new Michigan Health Information Research Institute being developed by MSMS. The November, 1967 issue of *Michigan Medicine*, on pages 1139 to 1143, gave MSMS members the first information (1) about a new Michigan Health Information Research Institute and (2) about the many ramifications of the "Where We Stand" publication. The publication was developed by MSMS Executive Director Hugh W. Brenneman, who also is responsible for the MSMS Research and Development area.

Physicians who might have missed any of the previous articles may wish to go back and read them. The following article is Chapter IX in the booklet. Copies are available from MSMS, 120 West Saginaw, East Lansing 48823.

Discussion

International Health

This is perhaps the weakest area of MSMS participation. Only in the past year or so has it had a Committee on International Health.

Need in Vietnam

That committee has determined that there is great need in Vietnam for medical aid, particularly if the United States is to reap any reward for its military action there. It will emphasize international health at the MSMS Annual Session.

MSMS Members Serve

Almost by contrast with MSMS as an organization, its members have been extremely active. Michigan doctors have led the nation in percentage of service contribution to Project HOPE, Partners of the Alliance, South Vietnam service, and as medical missionaries abroad.

Doctor Diplomacy

MSMS Participation in Foreign Affairs

Experts on foreign affairs have repeatedly pointed to the fact that doctors working in foreign countries have created more good will than any other "diplomacy" of this nation. These doctors must come from the private sector if they are to be most effective. MSMS has responsibilities as a member of society and a "corporate citizen" of the United States to participate in foreign affairs, particularly when it is recognized that Michigan business, industry, and transportation are now becoming major factors in foreign trade.

Opportunity for Leadership in AMA

Obviously, in many instances the AMA is the proper organization to work through, but a great opportunity exists in that organization for MSMS to give leadership in this field.

Questions

Michigan Partners of the Alliance Belize

A. What part should MSMS play in the medical care of the people of any foreign nation? Belize, as Michigan Partner in Partners of the Alliance for Progress?

World Peace

B. Does MSMS have any responsibility for maintaining world peace by assisting in developing friendly relations with neighbor nations?

Organized Foreign Medical Assistance

C. Should MSMS take an active role in national and international relationships with such organized efforts as the Partners of the Alliance, Project HOPE ship, AMA international physician placement service, etc.?

Recognition of Service

D. Should MSMS honor, individually, its members who are serving now
    1. In the armed forces?
    2. As medical missionaries?
    3. On the HOPE ship?
    4. In the AMA Viet Nam project?
    5. Etc.

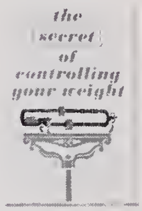
90 mg. Sodium Pentobarbital

FRONT SIDE

The Program

Weight Control Booklet

Specifically written to help your patients understand why they are overweight, and what they can do about it. The booklet stresses the importance of *changing lifelong eating habits* and explains how this can be done, sensibly, comfortably—and permanently. There is, also, a comprehensive list of foods showing their caloric content.



Food Diary

Designed to help the overweight patient follow your eating instructions. Space is provided for breakfast, lunch, supper, and even snacks. By writing down everything that's eaten each day, the patient is constantly reminded that she's trying to change her eating habits. And you are furnished with a written record of how well she's doing.

Picture Menu Booklet

A large (10″ x 10″) booklet which features appetizing lunch and dinner menus for every day of the week. The meals are depicted in full color and the correct portion size so that the dieter can see the amount of food that's recommended. Patients are pleasantly surprised to learn that each day's meals add up to only 1,000 calories. 801444

Brief Summary

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

Indications: Desoxyn and Desbutal are used orally as appetite suppressants, for reduction of mild mental depression, and to help in management of psychosomatic complaints or neuroses. Desoxyn, when administered parenterally, may be used as a vasopressor agent or analeptic.

Contraindications: Methamphetamine (in Desoxyn and Desbutal) is contraindicated in patients taking a monoamine oxidase inhibitor. Do not use pentobarbital (in Desbutal) in persons hypersensitive to barbiturates.

Precautions, Side Effects: Observe caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs. Prolonged usage may lead to tolerance or psychic dependence. Careful supervision is necessary to avoid chronic intoxication and drug dependence.

Amphetamine side effects such as headache, excitement, agitation, palpitation or cardiac arrhythmia usually may be controlled by reducing the dose. Paradoxically-induced depression is an indication to withdraw the drug. Pentobarbital (in Desbutal) may cause skin rash. Nervousness or excessive sedation with Desbutal is often transient.

Should State Support Osteopathic College?

THIS EDITORIAL APPEARED IN ANN ARBOR NEWS

There is every good reason for the state to proceed slowly with plans to support a college of osteopathic medicine.

Affiliation of an osteopathic institution with one of the state-supported universities is practically a prerequisite, but the schools with established medical colleges don't want an osteopathy program — at least not very badly.

The two disciplines — osteopathy and the traditional MD-granting medicine — barely coexist. But an osteopathic college with state support and university control is a maverick institution supporting itself on dribbles of federal aid, citizen contributions and money from the D.O.'s (Doctors of Osteopathy) themselves.

But with one new medical school (Michigan State University) being funded from scratch and other needs in medicine requiring urgent attention, a $10 million outlay for a college of osteopathic medicine cannot be justified economically.

What kind of prospective medical student is attracted to osteopathy, for example, and how many of this type of student are there out of, say, every 20 medical students? The state just isn't ready, in our estimation, to endow a small and controversial "branch" of medicine with a college of its own. ☐

THREE PHYSICIANS SERVE ON KIEFER CENTER BOARD

John Lumpkin, M.D., from the Detroit Medical Society, A. H. Hirschfeld, M.D., from Wayne County Medical Society, and James J. McClendon, M.D., president of the Detroit Board of Health, will serve on a 15-member board which will direct the Comprehensive Health Services Center, Inc.

Funded by a $2 million Federal grant and located at Herman Kiefer hospital, the health center will serve approximately 33,000 disadvantaged residents in the center of Detroit. Members of the Board of Directors represent various professional health organizations, the Detroit Health Department, the Mayor's Committee for Human Resources Development, and residents of the area to be served by the Health Center. ☐

RECEIVES ENURESIS AWARD

Barbara Starfield, M.D., of Johns Hopkins Hospital, has been named recipient of the 1967 Award of the Enuresis Foundation. James C. Breneman, M.D., Galesburg, president of the Foundation, said the award is presented annually "to the person thought to have contributed significantly to the knowledge and understanding of enuresis and its related afflictions." ☐

Voluntary Associations And the American Society

BY C. T. HARDWICK, Ph.D.
MSMS ECONOMIC CONSULTANT

Nature of Issue

In contemporary American society, we often contrast the private sector versus the public sector. In general everybody knows the government is on one side and free enterprise consisting of business and professions on the other side. Of course, in reality these opposing forces are compelled into cooperative ventures for total action. However, there seems to be a large organized force also present in current America which should be identified as the *voluntary associations.*

These free associations generally belong to the private sector, but for practical reasons a separate identification seems necessary.

Voluntary associations means an *organization of equals* which is composed of members who *join of free will* for common group purposes.

Some writers call these *mutual-benefit* organizations and examples would include professional associations, fraternal groups, unions, trade groups, clubs, veterans' groups, neighborhood groups and religious sects. Often these organizations are popularly called service groups with private and public interests. Often members are rallied around specific "causes." The organizers attempt to verbalize in idealistic terms the objectives and work of the association for the mutual benefit of members and society in general.

Of course the Michigan State Medical Society would be a prime example of a voluntary association. Individuals acting alone feel weak, but when joined together have strength and power.

IT MUST BE NOTED that voluntary associations are founded and also flourish in an open free society such as current days of progressive America. In a free society, it is part of our heritage and a principle of staying free to encourage the voluntary joining together of a few, or several or many citizens to promote or to fight any cause as they see fit, that is, it is natural for independent citizens to join forces as they please to combat or support government or other organized efforts. Obviously, as recorded history proves, the authoritarian or dictatorship can not and does not permit such freedom for voluntary associations. Hitler and Mussolini abolished and prohibited such mutual-benefit associations which would be expected to fight the monolithic government.

To satisfy the urge of their citizens the dictators usually organized "front" or government sponsored organizations to speak for voluntary groups.

Therefore, it seems essential to know and understand better the role of voluntary associations in the American society. We are fortunate that our natural inclination to form independent associations is permitted and even encouraged as a right of free citizens. Furthermore, a deeper understanding may assist in making voluntary associations more effective and constructive in furthering the well-being of a democratic society.

Growth and Organization

At the initial stages, a few enterprising individuals see the need and potentiality of joining forces with their fellow associates in forming a new organization. This leadership group then issues an invitation to a limited membership with the aim to organize a core action group.

Next, some idealistic and general objectives are identified such as educational, promotional, public relations and representative of delineated viewpoint. Then a broadcast for qualified members is issued and an organizing meeting will be called. Officers are elected and a program of action planned for the coming year. More and more members will be attracted and held if some crisis issue can be found and formulated. The cycle of electing officers and planning programs will have to be repeated for ensuing years.

Then the issues will become more critical or the membership will enlarge or the program will grow to ambitious heights and a reorganization will be stimulated. During the early formative years, all officers, leaders and workers will be part-time volunteers without much remuneration for efforts; thus their time, energy and attention will also be limited.

The increasing demands for more active programs require the employment of some full-time staff.

AT THE TIME OF hiring a full-time staff, some new division of labor will be necessary. The hired employees must assume the handling of routine daily business and the "back up" work for leaders and members. However, the voluntary leaders are still responsible for goals, policies, direction and control of organization.

Now the organization is ready for action at the matured stage of development. Old, routine programs will have to be up-graded; new programs launched and activities enlarged on a broader front.

Leadership and staff will have to analyze programs to determine which ones are merely routine and defensive. With the help of full-time staff, more programs of a constructive, positive and aggressive nature will have to be organized and supported.

In other words, programs will be conducted on two levels. For the short run, some practical service programs should be organized so as to involve as many solid members as practicable.

FOR THE LONG run, some bold and free-wheeling programs are desirable to influence the future direction of the association. These latter programs should be attractive to the younger and avant-garde members.

Since the financial resources of voluntary associations are very limited, usually membership dues are inadequate to support unlimited activities. Thus, each year the activities of staff, committees and programs have to be reviewed and evaluated as to annual contributions. A strict budgetary process will help at this stage of appraisal.

Critical Issues for Associations

In a free society, voluntary associations have strong reasons for growth and survival. As long as leaders and members have purposes and programs satisfying their personal and professional needs, the voluntary association will grow and prosper until government or social forces mount an offensive against them. The attack by government is not expected as long as free enterprise is popular.

THE QUESTION OF "other social forces" will be a challenge to every voluntary association. Unless the association satisfies members, other associations may be formed in a dynamic society. Therefore, independent associations have to be sensitive to readjustments in order to meet changing social needs. Generally voluntary associations have to meet selfish demands of members and still serve the general public.

The voluntary associations prosper on two fronts: namely, routine services to members and the handling of a crisis situation.

Repeated crises tend to solidify membership and leadership has a special problem of keeping up interest with members during ordinary and dull periods. Thus, the leaders have to develop foresight and stimulate interest in future issues. Every year the programs have to have some focus on critical issues to hold and attract interest and attention.

The acid test of the voluntary association in modern America will be settled at the local meeting centered on the questions:

(a) *Do we have a special purpose for existence?*

(b) *Is our organization the best means for accomplishing these purposes?*

In conclusion, the future for voluntary associations in America looks very bright and prosperous as long as we can answer a very strong *yes* to both of the foregoing questions. Therefore, the leadership group has to take immediate steps to keep their organizations alert to their responsibilities and opportunities to contribute constructively to the growth of our free society. If the independent organizations do not respond to this challenge, we have only ourselves to blame.

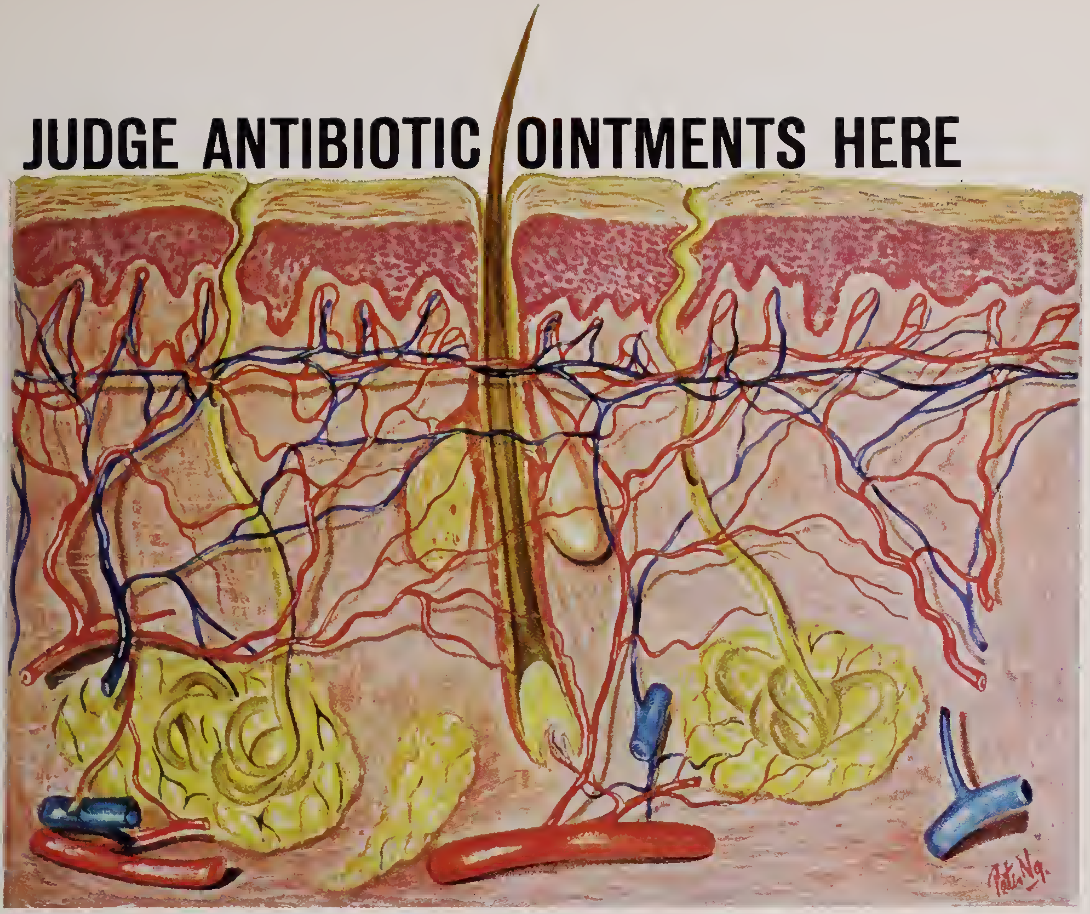
JUDGE ANTIBIOTIC OINTMENTS HERE



Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B — bacitracin — neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

Therapeutic breakthrough in non-narcotic control of the pain of trigeminal neuralgia

Warning
Fatal cases of aplastic anemia have been reported following treatment with Tegretol. Agranulocytosis, thrombocytopenia and transitory leukopenia have also been observed.
Complete blood and platelet counts should be done prior to and at regular intervals during treatment with the drug (see recommendations under "Important Note and Precautions") to help in the early detection of serious bone marrow injury. Abnormalities in initial blood tests should rule out use of the drug. Also, patients should be made aware of such early toxic signs of a potential hematologic problem as fever, sore throat, mouth ulcers, easy bruising and petechial or purpuric hemorrhage. Should such signs appear, the patient should be advised to discontinue the drug and to report to the physician immediately.

Indication Tegretol is indicated in the treatment of the pain associated with true trigeminal neuralgia. It is not a simple analgesic and should never be administered for relief of trivial facial aches or pains.
Contraindication Do not use in those with a known sensitivity to any tricyclic compound or in those being treated with M.A.O.I. agents. As long a period as possible should elapse before using Tegretol in patients who have been treated with M.A.O.I.'s, with a minimum of 7 days. In such cases, initial dosage should be low and the patient's reaction to gradual increments closely observed.
Important Note and Precautions Familiarity with the clinical symptoms which lead to an accurate diagnosis of true trigeminal neuralgia and with the complete prescribing information, careful patient selection, a thorough examination before treatment and close patient supervision throughout the treatment period are essential to the safe and effective use of this drug.
Where feasible, Tegretol should not be used in conjunction with any potent drug which may increase the possibility of toxic reactions.
In pregnancy, the drug should not be prescribed during the first trimester and thereafter only to patients in whom the clinical situation warrants the potential risk. It should not be administered to nursing mothers.
Patients with increased intraocular pressure should be closely observed during treatment with this drug because of its anticholinergic effect.
Because of the drug's relationship to other tricyclic compounds, the possibility of activation of latent psychosis and, in the elderly, of confusion or agitation, should be considered.
Dizziness and drowsiness may occur and patients should be cautioned about the hazards of operating machinery or automobiles and of engaging in other hazardous tasks.
Use cautiously in patients with a history of coronary artery disease, organic heart disease, congestive failure or liver disease.
Before initiating therapy, the following laboratory procedures should be performed:
1. Complete blood and platelet counts which, if abnormal, should rule out the use of the drug.
2. Baseline evaluations of liver function.
During treatment with Tegretol, the following laboratory procedures should be performed:
1. Complete blood and platelet counts should be done at intervals of one week during the first month of drug treatment, every two weeks during the second and third months, and at monthly intervals thereafter for as long as the patient is taking the drug. A trend toward a decreasing white blood cell count should suggest a dosage reduction and more frequent
laboratory and clinical evaluations. Should this trend continue, the dr
should be discontinued.
2. Liver function tests must be performed at regular intervals during t
ment with this drug since liver damage may occur during therapy. The
drug should be discontinued immediately in cases of aggravated liver
dysfunction or active liver disease.
3. Periodic eye examinations, including slit-lamp, funduscopy and tonc
etry, are recommended for patients being treated with this drug since
many phenothiazines and related drugs have been shown to cause ey
changes.
4. Complete urinalysis and BUN should be done on patients treated
Tegretol because of observed renal dysfunction.
Adverse Reactions Dizziness, drowsiness, unsteadiness on the feet,
nausea, vomiting, aplastic anemia, transitory leukopenia, agranulocyto
eosinophilia, leukocytosis, thrombocytopenia, purpura, abnormalities i
liver function tests, cholestatic and hepatocellular jaundice, urinary fre
quency, acute urinary retention, oliguria with elevated blood pressure,
albuminuria, glycosuria, elevated BUN, microscopic deposits in the uri
impotence, disturbances of coordination, confusion, headache, fatigue
blurred vision, transient diplopia and oculomotor disturbances, speech
disturbances, abnormal involuntary movements, peripheral neuritis an
paresthesias, depression with agitation, talkativeness, nystagmus, tinnitus, paralysis and other symptoms of cerebral arterial insufficiency,
pruritic and erythematous rashes, urticaria, Stevens-Johnson syndrom
photosensitivity reactions, alterations in skin pigmentation, exfoliative
dermatitis, alopecia, diaphoresis, recurrence of thrombophlebitis, eryt
multiforme and nodosum, aggravation of disseminated lupus erythema
tosus, gastric distress, abdominal pain, diarrhea, constipation, anorex
dryness of the mouth and pharynx, glossitis, stomatitis, fever, chills,
adenopathy, lymphadenopathy, aching joints and muscles, leg cramps
conjunctivitis, left ventricular failure, aggravation of hypertension, hyp
tension, syncope and collapse, edema, aggravation of coronary artery
disease and congestive heart failure. (Whether these cardiovascular e
are drug-related is not known. However, some of these complications
resulted in fatalities.) The necessity for discontinuing the drug should
dictated by the gravity and severity of the adverse reactions.
Dosage and Administration The drug should always be taken with mea
if possible.
Initial: One-half tablet (100 mg.) b.i.d. on the first day. Thereafter, the d
should be increased in one-half tablet (100 mg.) increments every 12 h
until freedom from pain is achieved. To relieve pain, between 200 mg.
1200 mg. per 24 hours may be necessary.
Maintenance: Initial control of pain can be maintained in most patients
with a dose of 400 mg. to 800 mg. daily. Maintenance doses may range
between 200 mg. and 1200 mg. daily.
At least once every 3 months during treatment period attempts should
made to discontinue the drug or to reduce the dose to the minimum effective level.
Availability Round, white, single-scored tablets of 200 mg. in bottles of 100 and 1000.

uncommon relief of
uncommon pain

Grounds...for Regroton®
chlorthalidone 50 mg.
reserpine 0.25 mg.

when you want to provide the combined benefits of two accepted agents in the treatment of mild to moderate hypertension. (Contraindications: history of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.)

when you want to prescribe therapy that is generally well tolerated. (However, adverse reactions may occur. For a complete listing, please refer to the full prescribing information which is summarized below.)

when your patient wants an easy-to-remember and reasonably priced regimen. (One tablet a day usually costs about a dime.)

Indications: Hypertension. **Contraindications:** History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. **Warning:** With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue 1 week before electroshock therapy, and if depression or peptic ulcer occurs. **Use in pregnancy:** Regroton should be used in pregnant patients or in women of childbearing potential only when, in the judgment of a physician, its use is deemed essential to the welfare of the patients; adverse reactions (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn. **Precautions:** Antihypertensive therapy with Regroton should always be initiated cautiously in post-sympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. To avoid hypotension during surgery, discontinue Regroton therapy two weeks prior to elective surgical procedures. In emergency surgery, use, if needed, anticholinergic or adrenergic drugs or other supportive measures as indicated. Because of the possibility of progression of renal damage, periodic kidney function tests are indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, Regroton should be discontinued and potassium supplements given, provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. **Adverse Reactions:** The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. **Average Dosage:** One tablet daily with breakfast. **Availability:** Pink, single-scored tablets in bottles of 100 and 1000. **For details, see complete Prescribing Information.** (B)46-600-B

Blue Shield Reports On Participation, Other Current Programs

BY MICHIGAN BLUE SHIELD

The Michigan Blue Shield report to The MSMS Council in April highlighted a number of topics of continuing mutual interest, of which the Participation Program remains of concern.

Participation Program

While participation agreements are increasing overall in every category, this five-month old program reveals definite trends which, although encouraging, are by no means entirely satisfactory. (See chart below).

Blue Shield's goal is 80% participation by the end of 1968.

In terms of specialty reaction to the Variable Fee Program on the part of doctors of medicine, a breakdown of current participation by generalist-specialist categories is revealing.

Current Physician Participation by Categories

81%	Pathology
81%	Pulmonary disease
81%	Preventative medicine
78%	General Practice
74%	Physical medicine and rehabilitation
72%	Radiology
70%	Dermatology
64%	Cardiovascular disease
59%	Ophthalmology
57%	Neurology
56%	General surgery
55%	Internal medicine
55%	Psychiatry
54%	Otorhinolaryngology
53%	Gastroenterology
51%	Unknown
50%	Allergy
50%	Drthopedic surgery
47%	Obstetrics and gynecology
44%	Neurological surgery
39%	Urology
36%	Anesthesiology
36%	Thoracic surgery
28%	Proctology
18%	Plastic surgery

The participation agreement constitutes the primary, tangible difference between Blue Shield and the insurance companies. Historically, because of its special relationship with the medical profession, the concept of "service benefits" has been a unique quality with respect to Blue Shield. Formal participation, which underlies the whole concept of "service benefits," is necessary if the Variable Fee Program is to maintain Blue Shield superiority.

Variable Fee Administration

Blue Shield has made a number of studies of physicians' fees based on the customary charges reported for Medicare patients and is now engaged in a broader study of the costs of medical care in Michigan.

Since February, 1967, accumulated data involving current charge patterns for a 12-month period have been processed by computer in three separate studies. These studies are insufficient for drawing any final conclusions.

When statistics from a 2-year experience are available, in February, 1969, conclusive studies will be made.

Utilization Review Research Project

This project has moved into an operational phase and is now fully staffed. The Utilization Review Medical Advisory Committee has made suggestions for patterns, profiles and special projects and three important activities are now under way:

1. PILOT STUDY, to determine the feasibility of accumulating a research tape on a subscriber or user basis, and to estimate costs of undertaking a demographic survey for addition to this tape;

2. RESEARCH TAPE, to build which both analysis and programming are now in progress;

3. HISTORY TAPE, featuring selected data being extracted from computer tape files dating from 1959 to 1967. This data will serve as a source of information for reports on past profiles and patterns and will provide a basis of comparison for future studies.

New DSR and Plastic Identification Cards

Blue Shield's claims handling volume is expected to increase from the present level of six million claims annually to more than thirty million within a few years. Among steps taken to prepare for this growth, the new Doctor's Service Report and development of an all-new plastic ID card are expected to simplify both reporting of claims and claims processing.

The new DSR, which will be distributed in

Category	Percentage of Participation December, 1967	April, 1968	Participation Totals	Total Doctors of Record April, 1968
M.D.	60.6%	63.0%	4757	7587
D.O.	44.0%	71.0%	1267	1790
D.S.C.	12.0%	73.0%	188	258
Total	56.4%	63.9%	6212	9635

June, eliminates the need for the patient's signature and involves reporting by code only. The embossed, plastic ID card for imprinter use, which will be introduced early in 1969, will make it possible to transfer all pertinent subscriber information directly to the reporting form. A separate report on this will be furnished to *Michigan Medicine* before implementation.

Both projects should greatly reduce the possibility of transposition errors on the reporting form and help to speed claims processing. ☐

Taxes Taking More And More of Person's Income in Michigan

BY ELMER WHITE
EXECUTIVE SECRETARY
MICHIGAN PRESS ASSOCIATION

Revenue from state and local taxes increased 96% over the decade 1957-67, the Michigan Department of Revenue reports. Over the same period, personal income reflected only a 67% increase in additional dollars.

Tax dollars collected from local property taxes increased 82%, but local income taxes levied by six Michigan cities pushed the figure to 92% over 1957 tax revenues.

State taxes show an even greater increase: 99% more revenue is flowing into Lansing from state-levied taxes than 10 years ago. Federal taxes from Michigan residents are bringing in about 65% more revenue than in 1957.

Each tax dollar is now divided into 79.29c for the Federal government, 11.52c for the state and 9.19c for local governments.

No matter how one views the figures, the conclusion is the same: taxes are taking a larger percentage from personal income every year. To the taxpayer it may make little difference which units of government get the spoils. He is left with fewer dollars to spend.

Yet, unless demands for government services decrease, it is doubtful that the trend to higher taxes will reverse itself.

(Editor's Note: This article appeared in a recent "Michigan Mirror" column written by Mr. White for Michigan newspapers) ☐

REPRINTS DISTRIBUTED OF UCER ARTICLE

Sandoz Company ordered 19,000 reprints of the article by Erol Ucer, M.D., Lapeer, on "Chlorpromazine and Thioridazine In Severe Mental Deficiency," which appeared in the March, 1968 issue of *Michigan Medicine*. ☐

Sustained circulatory, respirator and cerebral stimulation for th

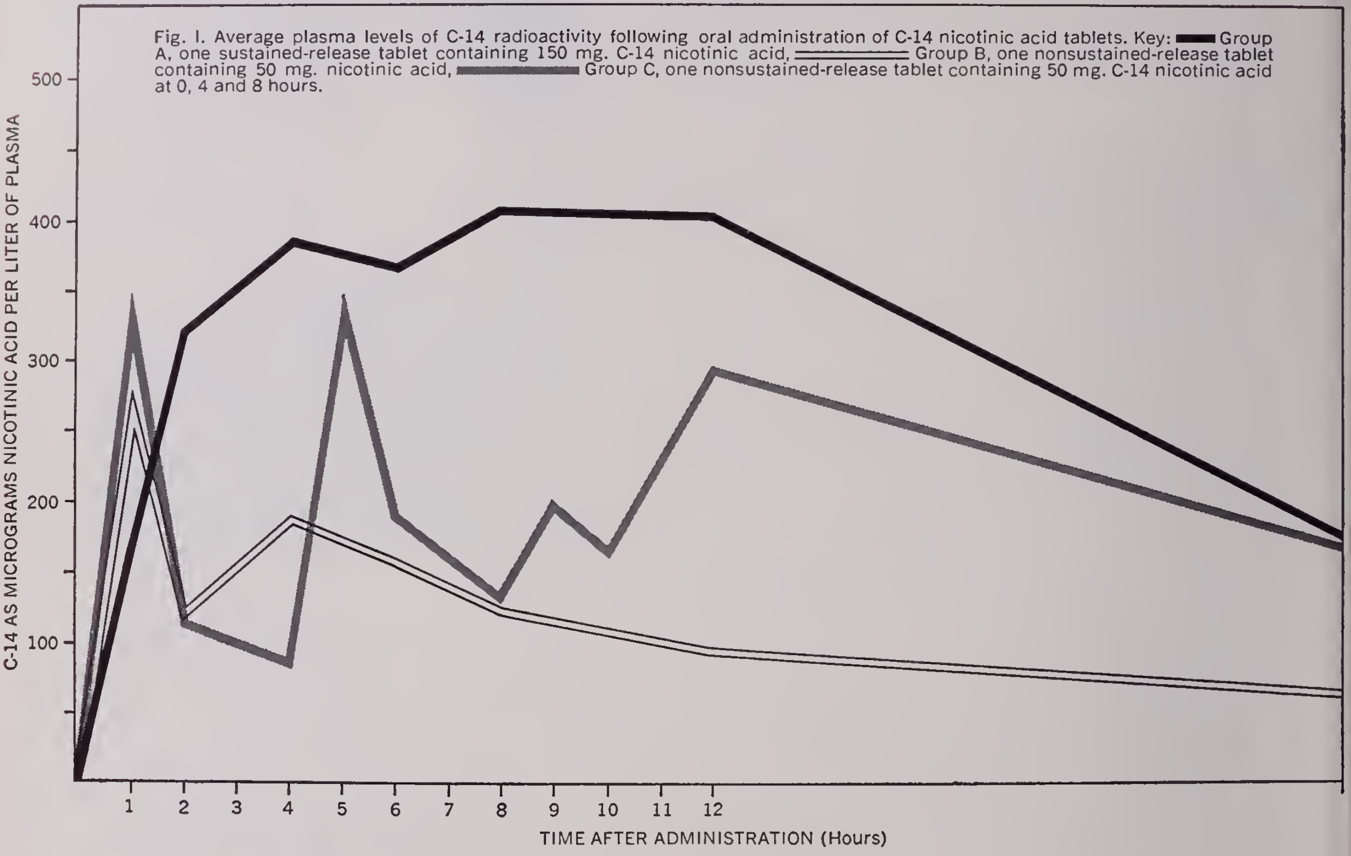

Fig. I. Average plasma levels of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═ Group B, one nonsustained-release tablet containing 50 mg. nicotinic acid, ▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

(fewer absent doses by absent-minded patients)

Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate signs of senile confusion. Patients become more alert

ged and debilitated

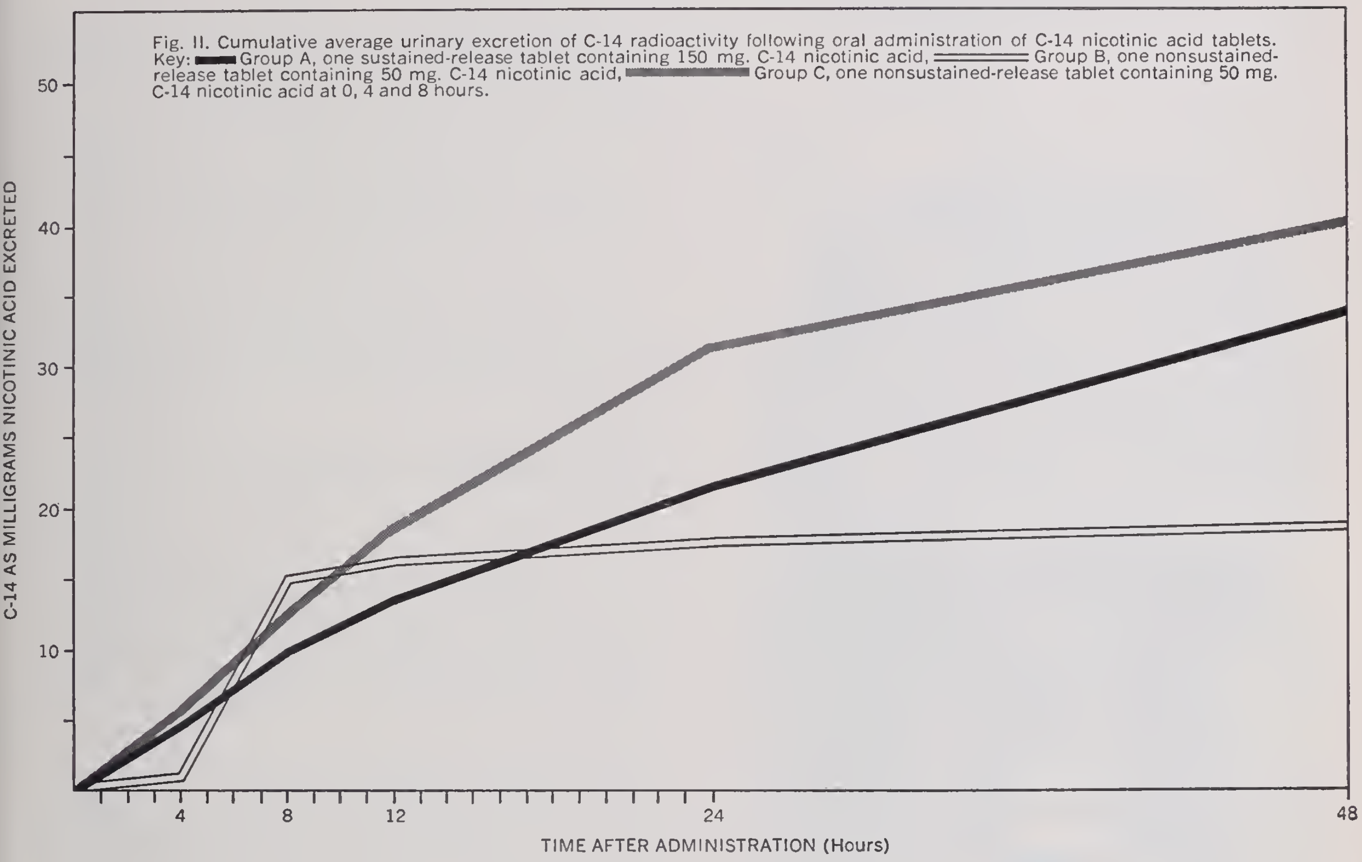

Fig. II. Cumulative average urinary excretion of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═ Group B, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid, ▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Work of Detroit Youth Commission in Health Is Explained

BY PETER HOHEISEL
OF THE MSMS STAFF

Several physicians are serving with the Detroit Commission on Children and Youth in several areas of activity with medical implications.

Among the members of the Commission, which is an agency of the City of Detroit and a cooperative agency with United Community Services, is Peter Beckett, M.D., of Lafayette Clinic.

Serving on the Advisory Committee is John J. Hanlon, M.D., Detroit Department of Health Commissioner. Both the Mental Health Committee and the Physical Health Committee have several physician members.

MENTAL HEALTH COMMITTEE

The Mental Health Committee is chaired by Richard Komisaruk, M.D., Director of the Clinic for Child Study. Other members are Lawrence E. Jackson, M.D., Director of the Children's Emergency Psychiatric Clinic at Herman Kiefer Hospital, Peter Beckett, M.D., Sander Breiner, M.D., Thomas A. Petty, M.D., and Lawrence P. Tourkow, M.D.

One of the activities was to work for the establishment of an emergency psychiatric clinic for children at Herman Kiefer Hospital. Financed initially by a $300,000 grant from the city and from United Community Services, the Clinic now is funded by the city and state. It has inpatient facilities for 20 youngsters, and provides several other services including a day care program and outpatient psychiatric care.

In the area of legislation, the committee, in conjunction with the State Department of Social Services, has recommended that the child abuse reporting law be amended in several ways. Among them are:

a) Eliminate the requirement for medical examination in the reporting of suspected cases of abuse.

b) Expand the function of the State Department of Social Services to include the responsibility for arranging a mandatory medical examination as part of its investigation in each case of suspected abuse reported to it, regardless of the extent of injury.

c) The physician's report be separated from the form on which the suspected abuse is reported and that it only contain an objective description of the child's condition and injuries.

d) Reword the law so that a non-medical person who initially observes the abuse is more clearly afforded identical immunity to that of the physician.

e) Provide the State Department of Social Services with the authority to assume payment for medical examination in such cases when the examination is arranged for by the Department and when the examination is secured by the observer, but the parents are unable to pay for it.

In cooperation with UCS, the committee published a fact sheet for reporting actual or suspected cases of child abuse in Detroit and Wayne County.

At present the Mental Health Committee is working to make the child abuse reporting law more effective.

Another project was to gather statistics on the incidence of suicide and suicide attempts by young people.

PHYSICAL HEALTH COMMITTEE

The Physical Health Committee has been especially active in the field of recruiting young people into health careers and up-grading sex education courses in schools.

Serving on the committee are C. Dale Barrett, M.D., Executive Director of PRECAD, and Margaret Zolliker, M.D., Director of the Maternal and Child Health at Herman Kiefer Hospital.

This past spring, about 200 selected students from Detroit public and parochial schools took part in a "Health Careers for Youth" program at Mercy College. They toured the Health Careers Mobile, heard Louis F. Hayes, M.D., discuss career opportunities, watched the new AMA film "Horizons Unlimited," and talked with counsellors about the field of health careers.

In the field of sex education, the Physical Health Committee was active in establishing the Detroit Sex Education and Information Council. Richard Komisarvk, M.D., Calier Worrell, M.D., and Everal Wakeman, M.D., are members of this Council and taking an active role in community education and in exchange of materials pertinent to sex education.

The committee has also been concerned about revising the Michigan sex education law.

Roberta Hughes is the executive director of the Detroit Commission on Children and Youth.

mudrane®

for

- EMPHYSEMA
- ASTHMA
- CHRONIC BRONCHITIS
- BRONCHIECTASIS

The fast-disintegrating uncoated tablet gives relief in 15 minutes

Each tablet contains:

Potassium Iodide	195 mg.
Aminophylline	130 mg.
Phenobarbital, Caution: May be habit forming	21 mg.
Ephedrine HCl	16 mg.

FEDERAL LAW PROHIBITS DISPENSING WITHOUT PRESCRIPTION

Precautions: Usual for aminophylline-ephedrine-phenobarbital. Iodides may cause nausea, long use may cause goiter. Discontinue if symptoms of iodism develop.

Iodide contraindications: tuberculosis, pregnancy.

DOSAGE

One tablet, with full glass of water, 3 or 4 times daily.

Dispensed in bottles of 100 and 1000 tablets.

MUDRANE GG—Formula, dosage and package identical to Mudrane—*except*—100 mg. glyceryl guaiacolate replaces the potassium iodide. The value of Mudrane cannot be enjoyed by a small group in which K.I. is contraindicated. Mudrane GG is prepared for this group.

MUDRANE GG ELIXIR—Four 5 cc teaspoonfuls is equivalent to one Mudrane GG tablet. Dosage adjusted to age and weight of child. Mudrane GG Elixir is for pediatric patients and those who think they cannot swallow tablets. Dispensed in pint and half gallon bottles.

MSMS Seeks To Improve Performance Of Medical Assistants

BY PHYLLIS MARQUARDT, CMA, KALAMAZOO; CHAIRMAN, MSMAS PUBLIC RELATIONS

"Education is the knowledge of how to use the whole of oneself. Many men use but one or two faculties out of the score with which they are endowed. A man is educated who knows how to make a tool of every faculty—how to open it, how to keep it sharp, and how to apply it to all practical purposes." —*H. W. Beecher*

One of the most important objectives of the Michigan State Medical Assistants Society is to "render educational services for self-improvement to its members."

In turn this improvement is reflected to their employers by their increased value to him. Because of this many doctors not only urge their medical assistants to become active in the group, but subsidize the membership for their employees. What is practically impossible to accomplish individually can be accomplished by pooling the thinking of many. It is the same with the American Association of Medical Assistants.

It has been said many times that the only real justification for an organization such as MSMAS and AAMA is improvement in the medical assistants' performance on the job.

SINCE MSMAS WAS organized (1949) each county chapter has had its education chairman who arranged special programs, both formal and informal, in which the members could participate. Speakers at the monthly meetings are chosen for the scientific and educational stimulus they can bring to the members. The exchange of ideas and suggestions among the members is also a part of the educational program. All of these ideas are as important today as they were when we felt the need for an organization such as ours. However, as the practice of medicine becomes more and more specialized and more physicians are forming "group practice," the educational needs of the medical assistant could not be met in these ways alone.

MSMAS was a forerunner in preparing an in-service training program with the cooperation of the Michigan State Medical Society and the Extension Service of the University of Michigan. With additional help, in the form of a grant, from the W. K. Kellogg Foundation six syllibi were prepared as a guide for the formal classroom study through adult education classes. These syllibi are still being used by many of our county chapters, although the course material needs revision to meet the present educational requirements of the members. It is the hope of the MSMAS Education Committee that this revision will be accomplished this year.

IN 1959, ONLY three years after the birth of AAMA, at the insistance of medical assistants all over the country, the AAMA House of Delegates approved the appointment of a special committee to develop a Certification Program. Presently serving on the Certifying Board are three physicians, three educators, six medical assistants (all CMA's), the AAMA president and president-elect, plus an additional medical assistant who serves as the chairman. The goals for this program are as follows:

1. To help physicians identify those qualified as top-level office assistants, administrative and clinical.

2. To establish professional standards and goals for medical assistants.

3. To assist schools and colleges in developing training programs for medical assistants.

4. To prepare and administer an annual examination.

5. To certify those who successfully complete the examination.

Certification is not required for membership in MSMAS or AAMA, but it is an opportunity for the medical assistant to voluntarily upgrade her position. It is not a requirement for holding or obtaining a job as a medical assistant, and, further, it is not an attempt to evaluate her performance on her present job.

The examination is divided into seven sections. All candidates must pass the first three sections of the examination which are:

1. Medical terminology, anatomy and physiology.

2. Personal adjustment and human relations; medical ethics and etiquette.

3. Medical law and economics.

For the Administrative Certificate the candidate must also pass sections 4 and 5 covering:

4. Office skills and procedures; accounting, credits and collections.

5. Written and oral communications; records, medical and non-medical.

The candidates for the Clinical Certificate must pass, in addition to the first three sections, section 6 and 7:

6. Examination room techniques, sterilization procedures and care of equipment.

7. Laboratory orientation.

IN ORDER TO BE eligible for certification testing the applicant must be at least 21 years of age at the time of application, be a high school graduate or sumbit equivalency certificate, have a minimum total of three years employment by a Doctor of Medicine in an office, hospital or clinic, have at least twelve months continuous employment with one Doctor of Medicine, hospital or clinic, and the application must be signed by the current or most recent employer. (Membership in AAMA is not a requirement for certification testing.)

Financial aid was forthcoming from the American Medical Association to help us launch this program. For the past eight years Merck, Sharp and Dohme has contributed an annual grant of $5,000.00 toward the administration of this program.

There has been a steady increase both in the number of assistants taking the examination as well as the number of regional test centers throughout the country. There are now a total of 225 Certified Medical Assistants in the United States, eight of whom are in Michigan. The examination is difficut but it is not impossible for the candidate who prepares for it. It is broader than almost anyone's actual experience; therefore, few persons would be expected to pass without some review and study. A broad study outline of all sections of the examinations, with a list of reference books, is available upon request from the AAMA headquarters in Chicago.

Another step in the educational field for medical assistant is the recent formation of the Approval Program for medical assistants' courses in community junior colleges. Lederle Laboratories gave $5,000 to AAMA for implementation of this program. Until this time AAMA was one of the few para-medical groups that did not have an approval program, and because of this we were not able to recommend training programs to the hundreds of students who requested this information. The ground work has laid for a standardized training course for approved junior colleges throughout the United States — probably a two-year course leading to an associate arts degree in medical assisting. We are hopeful that this will help recruitment of trained medical assistants to fill the ever-increasing need in this field. This is an important long-range program and a major undertaking for AAMA. Northwestern Michigan College, in Traverse City, is one of the colleges participating with AAMA in this program.

Other educational opportunities provided by MSMAS for its members include the annual convention, which is held at the same time and in the same city as the MSMS convention, workshops, seminars and leadership training symposiums.

CONTINUED: MEDICAL ASSISTANTS

Other areas, not to be overlooked, are the *Bulletins* from both MSMAS and AAMA which carry invaluable articles for all medical assistants.

MSMAS IS AWARE of the need to meet the challenge of the "changing times" and will continue to strive to provide the best educational opportunities for all medical assistants and improve the quality (and quantity) of MSMAS in-service training programs.

Together with the high goals and standards we have set for ourselves through our organization we must also have some personal satisfaction by challenging ourselves to be knowledgeable, informed, enthusiastic and have as our first consideration the best interest of our employers and patients. □

To Improve Hospital . . .

Many suggestions are made every day to improve the hospitals in Michigan . . .

One of the recent ones at the University of Michigan Hospital was recorded by a 12-year-old boy, who suggested, "I would put the doctors in bed, and let the kids give the shots."

Parke-Davis Scientist Praises Work Performed By Zonal Centrifuge

A Parke, Davis & Company scientist has described the zonal centrifuge as a most useful instrument for large-scale purification of virus vaccines.

Dr. Manuel Rosenbaum, a research microbiologist in the Detroit laboratories of the pharmaceutical firm, said the zonal centrifuge, developed by Dr. N. G. Anderson, under the auspices of the Atomic Energy Commission and the National Institutes of Health, has been used "with great success in the continuous-flow processing of large volumes of crude vaccine materials with very efficient recovery of the immunizing agent and removal of essentially all extraneous matter."

Dr. Rosenbaum said that Parke-Davis had used the zonal centrifuge extensively in research operations, and he felt it would be a very useful adjunct in producing the improved purified-antigen influenza vaccine prepared by the ether-extraction method pioneered in the drug company's laboratories. □

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg.,
phenobarbital 64.8 mg. (1 gr.)
(Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety... helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

IN MEMORIAM

V. D. Barnes, M.D., Livonia

Van D. Barnes, M.D., retired Livonia physician, died April 7, 1968, at the age of 76.

Doctor Barnes had carried on active practice for 46 years before his retirement. He was a 1915 graduate of the University of Michigan Medical School. Affiliated with U.S. Veteran's Administration hospitals for 30 years, he was a member of staff at the Dearborn V.A. Hospital from 1939 to 1961 and at the V.A. Hospital, Ann Arbor, from 1956-58. During World War I he served as a major in the Medical Corps.

He was a member of the American Legion, Rotary Club and Pi Upsilon Rho medical fraternity.

J. R. McBride, M.D., Lapeer

John R. McBride, M.D., Lapeer physician, died March 28 at the age of 64.

Doctor McBride had maintained a general practice in the Lapeer area for 30 years, having begun practice at North Branch. He received the M.D. degree in 1929 from the University of Iowa College of Medicine. During World War II he served as a captain in the Medical Corps.

LEGISLATURE PAYS TRIBUTE TO NORTHVILLE PHYSICIAN

The Michigan House of Representatives recently adopted a resolution memorializing the work of the late Irene L. Sparling, M.D., of Northville.

Doctor Sparling, who died in December 1967, worked for 40 years in Northville as a general practitioner, specializing in obstetrics-gynecology. She and her husband, Harold I. Sparling, M.D., both opened their practice there in July of 1925.

The conclusion of the resolution reads: "Resolved by the House of Representatives, that . . . a memorial of tribute be accorded Dr. Irene I. Sparling whose early determination to excell in medicine for the sake of future patients carried her to that goal, despite economic handicap; and who kept that trust faithfully, beyond the call of duty, for 40 years without fail." □

After the picnic even Gramps Was a victim of intestinal cramps

Parepectolin for quick relief of acute diarrhea
...soothes colicky pain with paregoric*
...consolidates fluid stools with pectin
...adsorbs irritants with kaolin,
and protects intestinal mucosa

In elderly patients it is particularly important to stop the diarrhea fast. Parepectolin helps you control diarrhea promptly and gain the patient's confidence until etiology has been determined.

Parepectolin®

Each fluid ounce of creamy white suspension contains:
*Paregoric (equivalent) . . . . (1.0 dram) 3.7 ml.
Contains opium (¼ grain) 15 mg. per fluid ounce.
warning: may be habit forming
Pectin . . . . (2½ grains) 162 mg.
Kaolin (specially purified) . . . . (85 grains) 5.5 Gm.
(alcohol 0.69%)
Usual Adult Dose: One or two tablespoonfuls three times daily.

Should Hospitals Adopt Seven-Day Week?

(Editor's Note: The following is excerpted from an editorial in the Bulletin of the Muskegon County Medical Society. Editor Robert M. Jesson wrote, in part, the following about the possibilities of hospitals operating seven days a week.)

"In view of recent activities in Muskegon, possibly additional service could be rendered to the patient by implementation of a 7 day week in our hospitals. This might interfere with the 3 and 4 day week of some of our colleagues, as well as the tendency of others to hospitalize people for several days ahead so as to obtain a good operating room time, but the lack of a two day gap out of every 7 certainly benefits most patients and doctors. Changes in laboratory service would be necessary too.

"It would seem to be an experiment well worth trying, especially if our local hospital costs are anywhere near that of the national average. Certainly a 6 to 12 month experiment in this could be accomplished with minimum difficulty and would provide some interesting figures for hospital administration.

"This idea should bear consideration in light of the present circumstances.

"It can be started literally overnite."

Thomas V. Kretschmer, M.D., Saginaw,

was named recipient of the first distinguished alumnus award presented by St. Mary's High School in Saginaw. He was chosen because "he has been a humanitarian, has set an example of good Christian living and has contributed much to Saginaw," said the pastor of St. Mary's.

A. E. Humphrey, M.D., Marshall,

was honored at a testimonial dinner at Schuler's in Marshall and received a plaque presented by a member of the Social Services Board citing his "dedicated professional and personal service" to the aged and needy of the community.

Richard W. Dow, M.D., Ann Arbor,

an instructor in the U-M Medical School, is one of 25 medical researchers in the nation recently named as Markle Scholars in Academic Medicine. The Markle Foundation pays $30,000 at a rate of $6,000 yearly to the medical school at which a scholar is appointed.

Joseph F. Sadusk, Jr., M.D., Grosse Pointe,

has been elected to the Board of Directors of Parke, Davis and Company. Dr. Sadusk, who has served as associate dean of the Johns Hopkins University School of Medicine and as medical director of the Food and Drug Administration, is presently vice president, medical and scientific affairs at Parke-Davis.

Sidney E. Chapin, M.D., Dearborn,

medical director of the Visiting Nurse Association Home Care Program of Detroit, participated on the program of the 38th Annual Tri-State Hospital Assembly in Chicago. He served on a panel and also presented a paper entitled "Building Physician Support for Home Care."

Michigan
State
Medical
Society

Bonnie R. Wolfram, M.D., Grosse Pointe,

has accepted the chairmanship of a new national committee named by George Lingua, president of the National Kidney Foundation. The committee's purpose is to implement programs for prolonging life and restoring to useful activity victims of kidney failure.

Dr. Wolfram's group, the Trustees' Dialysis and Transplantation Committee, will consider sources for financing of patient care for the 6,000 to 10,000 individuals annually needing artificial kidney treatment (hemodialysis) or transplantation in order to survive.

Jack Lapides, M.D., Ann Arbor,

professor of surgery in the University of Michigan medical school, was presented the William P. Burpeau Award and honored as "one of the nation's outstanding urologists," by the American Academy of Medicine, Urology Section, at a recent meeting of the Academy in West Orange, N. J. He delivered a lecture on "New Concepts Regarding Urinary Infections."

Donald L. Schaefer, M.D., John S. Wyman, M.D., and Robert E. Anderson, M.D., all of Ann Arbor,

were participants on the program of the 46th Annual Meeting of the American College Health Association in Minneapolis.

Paul E. Derleth, M.D., Ferndale, and Norman J. Goode, M.D., Detroit,

were promoted to new positions in the Detroit Edison Company. Doctor Derleth is the new medical director and Doctor Goode will serve as assistant medical director.

Otto Von Renner, M.D., Reese,

longtime Vassar general practitioner, celebrated his 95th birthday recently. "I live very simply, enjoying the common things," he said.

Harold T. Donahue, M.D., Cass City,

was named Cass City Citizen of the Year at a recent Chamber of Commerce dinner.

Muir Clapper, M.D., Detroit,

Professor of Medicine at Wayne State University School of Medicine, has been elected to a three-year term on the Board of Governors of the American College of Physicians. Elections were held at the College's 49th Annual Session in Boston recently.

MICHIGAN MEDICINE

Read This Issue for Topics, Speakers For 1968 Annual Session Program

Doctors of medicine, wives, medical assistants, nurses, senior medical students, interns and residents, are invited to participate in the Annual Scientific Session of the Michigan State Medical Society to be held at the Sheraton-Cadillac Hotel in Detroit on Wednesday and Thursday, September 25-26.

The scientific program, composed of courses, general sessions, and section meetings, will be preceded by the annual House of Delegates meeting. The delegates will be in session Sunday night, September 22, and all day, September 23 and 24.

SCIENTIFIC MEETINGS ON Wednesday, September 25, will focus on breast carcinoma, trauma, pediatric problems, the relief of pain, and other subjects. Infectious diseases and pulmonary diseases will be studied in the courses during that day.

General meetings on Thursday, September 26, will deal with cardio-vascular diseases, prostate carcinoma and calcium, psychoanalytic problems of the aging population, transplantation, cancer, thyroid, infectious diseases, shock, gastro-intestinal tract diseases, and other subjects.

Courses on gastro-intestinal tract diseases and blood diseases will be held throughout the day, September 26.

CHAIRMAN OF THE Annual Session Program Committee is Alexander J. Walt, M.D., chairman of the surgery department at Wayne State University Medical School.

The Woman's Auxiliary to MSMS will hold its annual convention September 24-25-26 at the Statler-Hilton in Detroit.

The Michigan State Medical Assistants Society will be in session September 25-26 for its annual convention at the Pontchartrain Hotel.

MSMS ANNUAL SESSION, SEPT. 25-26

House of Delegates, Sept. 22-23-24

MSMS to Appoint New Committee On Quackery; Plan Approved

The appointment of a new "MSMS Committee on Quackery" was approved by the MSMS Council at its June 5 meeting, acting upon recommendations from the April 1 invitational conference held by MSMS at its headquarters to explore possible areas of MSMS activities.

The report of the April 1 working conference suggested that MSMS could implement an "action program" through a committee. The committee, according to recommendations approved by The MSMS Council, will take the following three steps:

"1. To meet with appropriate officials in the Department of the Attorney General to prepare legislation better defining "quackery" and setting stiffer penalties; to develop consumer fraud educational programs for presentation to civic clubs; and to assist the Department in obtaining sufficient budget and personnel to investigate and prosecute health frauds. (The MSMS PR Committee previously recommended a Committee on Quackery and The Council concurred, but no Committee has been named)

"2. To confer with Michigan state school officials (Department of Public Instruction, appropriate universities, and school administrators) to develop programs of education for physicians, teachers and pupils regarding health quackery, particularly nutritional misinformation.

"3. To consider the ways and means by which the medium of television can be most effectively used as a mass education technique regarding health quackery, thus particularly taking the necessary message to all segments of the society and particularly the shut-in elderly."

The April 1 conference was attended by legislators, law enforcement officials, federal agency representatives, health agency officers, the press, and physicians.

Offer New Blue Cross-Shield Coverage for MSMS Members

The Michigan State Medical Society will offer eligible members a new, expanded Blue Cross and Blue Shield program, known as MVF-2, effective August 1, 1968.

Those members presently enrolled will be automatically changed to this new coverage on that date.

Those members not now enrolled may obtain this new program at the same time if you act within the time schedule.

The new program will introduce benefits for care in convalescent facilities — outpatient psychiatric care — expanded benefits for nervous and mental conditions — plus the new Michigan Variable Fee system for paying physicians their reasonable and customary charges. All of this will be in addition to the basic Blue Cross hospital care benefits and Blue Shield physician care benefits.

Further information will be mailed in the latter part of June from Robert J. Mason, M.D., Chairman of the Council, to every MSMS member. His covering letter explains that "this expanded Blue Cross and Blue Shield program is based on the recommendation of the MSMS Committee on Professional Insurance Plans."

MSU Allocated $1 Million for Med Building

Michigan State University is moving ahead with plans for its first medical school building.

The State Legislature recently appropriated $1 million for initiating construction of the Life Sciences Building during the 1968-69 fiscal year with the understanding that an additional $3 million will be needed in the following two years.

Additional money needed for the building is expected from federal and private sources.

The Kellogg Foundation has already granted $625,000 in support of the construction, and three agencies of the United States Public Health Service have approved, but not funded, grant requests totaling $5 million in support of the construction.

The Life Sciences Building will enable MSU to expand each entering medical student class from 26 to 64 students, to double the number of nurses it is graduating, and to greatly increase its graduate and postdoctoral enrollments in pharmacology.

The buildings will house the Department of Medicine, the Department of Pharmacology, the School of Nursing and administrative offices of the College of Human Medicine and the College of Veterinary Medicine.

Dedicate Cancer Research Center

The vision and hard work of the late G. Donald Cummings, M.D., have materialized in the recent dedication of the $900,000 G. Donald Cummings Cancer Products Development Center in Lansing.

The State Public Health Department research center will work on the acceleration of new chemical compounds to treat cancer. Since 1956 the Public Health Department has been engaged in cancer research to discover and develop drugs to effectively treat the disease.

Doctor Cummings, who led efforts to get the legislature to appropriate money for the Center, died last year. He had been director of health department laboratories since 1944.

Doherty Receives Governor's Award

John A. Doherty, executive director of the Michigan Health Council, was one of 50 leaders who received Michigan Minuteman awards recently.

Governor Romney gave the awards in recognition of "extraordinary and distinguished service as spokesmen for Michigan and for promoting the state" at a ceremony in front of the Capitol.

APPRECIATIVE!

Thank you so very much for the excellent article by Phyllis Marquardt that you published for the Medical Assistants in the June issue of *Michigan Medicine*. It's always so good to see MSMAS in print . . . and a beautiful spread . . . thanks!

Betty Lou Willey, CMA
Port Huron
AAMA Speaker
MSMAS Past President

HONOR TO HANLON

John J. Hanlon, M.D., class of 1940, was one of the six "distinguished alumni" of Wayne State University to be honored at the Centennial Reunion.

Contributions by Doctors Given 3 Medical Schools

Checks for $20,431.63 were presented to the three Michigan medical colleges by MSMS officers in a ceremony June 5 at the headquarters.

The checks represented recent contributions by Michigan physicians and others for medical schools at the University of Michigan, Wayne State University and Michigan State University. The checks were from the American Medical Association Education and Research Foundation, which handles direct contributions to each of the 94 medical schools and also prorates general contributions by physicians and other interested individuals, companies and foundations.

The University of Michigan check was for $12,203.11; Wayne State University for $6,911.91, and Michigan State University for $1,317.61. The contributions are unrestricted and can be used by the medical schools for whatever purpose the school has greatest need, explains Robert J. Mason, M.D., Chairman of The MSMS Council.

A check to the University of Michigan Medical School from the AMA-ERF is presented to Fred J. Hodges, M.D., right, representative of the medical school, by B. M. Harris, M.D., Ypsilanti, MSMS President.

A check to the Wayne State University Medical School from the AMA-ERF is presented by Robert J. Mason, M.D., right, MSMS Council Chairman, to Muir I. Clapper, M.D., representative of the WSU school.

A check to the Michigan State University College of Human Medicine from the AMA-ERF is presented to Dean Andrew Hunt, Jr., M.D., left, by Kenneth H. Johnson, M.D., Lansing, MSMS Secretary.

ADD: IN MEMORIAM

In addition to the names reported in the June "In Memoriam," the following news has reached the MSMS office. Details will follow in the July *Michigan Medicine*:

Randall M. Cooley, M.D., Jackson, died May 20.

Harry F. Dibble, M.D., Detroit, died May 10.

Nathan H. Goldberg, M.D., Detroit, died May 4.

Joseph Hickey, M.D., Dearborn, died April 12.

George W. Stewart, Jr., M.D., Saginaw, died May 13.

EDITORIAL REPRINTED

A *Michigan Medicine* editorial by George H. Lowrey, M.D., about Foreign Physicians was reprinted in the May 13 issue of the *AMA News.*

Brooker L. Masters, M.D., Fremont, and Sharon McAfee, of the MSMS staff, examine a display and a new brochure which the Michigan Health Council, in cooperation with Consumers Power Company of Jackson, is distributing in hope of attracting family physicians to practice medicine in rural areas of Michigan. Copies of the folder are available from the Michigan Health Council, 712 Abbott, East Lansing 48823. (An article about the brochure appeared in the June issue of MICHIGAN MEDICINE.)

MHC PLACES 69 DOCTORS IN STATE, 10 MONTHS

The Michigan Health Council M.D. Placement Service has assisted 69 physicians in locating in Michigan communities during the past 10 months compared to 59 during the same period of 1967. Since January 1, 1968, 21 doctors and communities have been helped including Gaylord, Allegan, Grand Haven, Baldwin, Mt. Pleasant, Ishpeming, Petoskey, Kalamazoo, Grand Rapids, and Battle Creek. There still are more than 124 communities seeking family physicians and 55 seeking medical specialists.

Michigan Health Council recently conducted a survey to determine how many physicians, dentists, osteopaths, registered nurses, practical nurses and dental hygienists there are in each county. The survey showed Michigan had one MD for every 1,014; one DO for every 4,375; one DDS for every 1,986; one RN for every 205; one LPN for every 494; and one RDH for every 7,143.

The following totals are reported by Michigan Health Council for Michigan, which showed a population of 8,500,000:

8,379 – M.D.
1,943 – D.O.
4,279 – D.D.S.
41,410 – R.N.
17,213 – L.P.N.
1,190 – R.D.H.

Complete statistical reports for the many counties, are available from Michigan Health Council, 712 Abbott Road, East Lansing, Michigan 48823.

Named by Governor To Help Handicapped

Jens D. Henriksen, M.D., Battle Creek, is one of 20 Michigan professional and businessmen who will serve on the Governor's Commission on Employment of the Handicapped. Doctor Henriksen directs the Department of Physical Medicine and Rehabilitation of the Battle Creek Rehabilitation Institute.

Public Act 11 of 1968 made the commission official and placed it in the Department of Education. The commission works closely with the State Department of Education's Vocational Rehabilitation Division and the Michigan Employment Security Commission.

MCHSS Names Action Committees; 61 Recommendations under Study

Meetings during June and July are scheduled for the six Michigan Community Health Services Study regional task forces "to determine priorities for implementation . . . and to develop appropriate action plans."

The MCHSS (a cooperative project of the University of Michigan School of Public Health, the Michigan Department of Public Health and the Michigan Health Officers Association) has recently appointed 10 action committees. The only physician appointed as an action committee chairman was Richard D. Mudd, M.D., Saginaw, named chairman of the Water Pollution and Other Environmental Health Services Committee.

The 315 members and consultants of the Regional Task Forces and the parent Committee of Forty, recently rated the 61 recommendations of the proposed final report on a priority basis.

No. 1 top priority was given to a proposal calling for "the establishment of state and area-wide comprehensive health planning programs and advisory councils, with the majority of the members being consumers of health services."

MAGP TO CONDUCT SMOKING WORKSHOP AT MSU, OCT. 20

The Michigan Academy of General Practice will conduct a physician workshop on Smoking and Related Disease at Michigan State University's Kellogg Center, October 20, 1968. Member organizations of the Michigan Council on Smoking and Health are being asked to help plan and conduct the workshop. MSMS planning efforts will be headed by Oscar D. Stryker, M.D., chairman of the MSMS Committee on Public Health.

Says Police Using Mace Should Have Special Training

Chemical Mace can be used with comparative safety as a weapon to incapacitate a person temporarily if certain precautions are taken, says Maurice H. Seevers, M.D., chairman of the University of Michigan department of pharmacology. He has declared that if the controversial spray is used properly there is no danger to a person's eyes or other organs or tissues.

Doctor Seevers suggested that officers responsible for using Mace should be carefully taught its proper use and the potential hazards of indiscriminate use or accidental misuse.

Doctor Seevers has completed testing the controversial spray on monkeys and rabbits in department laboratories at the U-M Medical School. The research was undertaken at the request of Ann Arbor City officials after local police suspended use of the weapon.

Doctor Seevers did report also that "severe, long-term, and possibly permanent ocular damage may occur if the cornea of the eye is exposed directly to Chemical Mace in liquid form. Such exposure resulting from discharge of the canister would, in our opinion, constitute misuse of the weapon."

Newspapers Describe New MSMS Efforts to Combat Quackery

In a further effort to combat quackery, MSMS sponsored a recent workshop that resulted in many news articles in the Michigan press.

The conference, at the MSMS headquarters for selected legislators, law-enforcement officials, educators, attorneys and lay leaders, was well covered by the press.

Articles appeared in the many newspapers with the following typical headlines:

Kalamazoo Gazette: "Medical Society Says 'take' Huge: Seeks Curb of Health Quackery."

Benton Harbor News Palladium: "Michigan Fighting Health Quacks."

Ypsilanti Press: "State Doctors Aim at Quacks."

Bay City Times: "Crack down on Quackery Planned; Medical Society Campaign."

Battle Creek Enquirer and News: "Doctors Declare War on Health Quacks."

And there were many, many others, all reflecting the MSMS concern.

BACK IN DETROIT FROM HOPE SHIP

Recently returned from a two month tour of duty with the Hope Ship is Henry VandenBerg, Jr., M.D., of Detroit. Doctor VandenBerg served in Colombo, Ceylon, the seventh trip made by the Hope Ship.

AMA CITES TWO MSMS PR EFFORTS

The current issue of *PR Doctor,* publication of the AMA as "a working guide to positive medical public relations," carries two articles about MSMS.

One story tells about the 1967 MSMS Annual Session feature of offering the registrants the chance to "have lunch with the speakers."

Another item describes some of the many MSMS activities with and for the students at the three Michigan medical schools. The article contends that "medical societies, in responding to students today, can look forward to more responsive members tomorrow."

Jaffar to Lead Urologists 1969-70

Recently chosen president-elect of the American Urological Association was Donald J. Jaffar, M.D., Detroit.

Doctor Jaffar, clinical professor of urology at the Wayne State University School of Medicine, was so honored at the annual convention at Miami.

He will be installed as president for 1969-70 next May.

MIDLAND M.D. NOW IN VIETNAM

Most recent member of the Volunteer Physicians for Vietnam, sponsored by the American Medical Association, is Henry C. Scharnweber, M.D., a general practitioner with the Dow Chemical Company in Midland, Michigan. Doctor Scharnweber joins the ranks with many other Michigan physicians who have served in the program.

Leon Swatzell, right, the new AMA field representative assigned to Michigan and several other midwest states, attended the recent June meeting of the MSMS Council. Council projects and MSMS committee work are explained to Mr. Swatzell by Robert J. Mason, M.D., left, Chairman of The Council. Mr. Swatzell will visit the MSMS House of Delegates and the Annual Session in September and will serve as the liaison representative between the AMA and the MSMS and Michigan county medical societies.

Opinion Says Different Fees OK For Ophthalmologists Optometrists

The following opinion of the Michigan Attorney General about fees for ophthalmologists and optometrists is quoted from the *AMA Citation* publication:

"Statutes allowing a person covered by health insurance to have a free choice of either an ophthalmologist or an optometrist for optometric services and requiring public agencies to accept the services of an optometrist on the same basis as those of any other person licensed to render a similar service do not prohibit different fee schedules for ophthalmologists and optometrists for performing the same or similar services. The Attorney General of Michigan so ruled in a recent opinion.

"An optometrist merely examines eyes for refractive error, while an ophthalmologist is a duly licensed physician who specializes in the care of eyes. Because of the differences between ophthalmologists and optometrists as to knowledge, skill, training, approach, methods employed, and professional responsibility, different fee schedules for similar services are permissible. Statutory provisions requiring that the two professions be treated on a parity relate to the employment of the services of members of the professions, not to the payment of fees.—*Opinion of the Michigan Attorney General*, No. 4497 (Mich., March 19, 1968)"

HOUGHTON GIRL WINS SCIENCE AWARD

One of the six Award of Merit citations presented by the American Medical Association at the 19th International Science Fair in Detroit recently was won by Miss Cathleen Work, 16, a senior at Houghton Central High School in Houghton.

Miss Work explains that she undertook her exhibit-study, "The Effects of Inhibiting the Thyroid," to discover the effects of propylthiouracil on rabbits. Through observation and measurements she recorded changes in heart rate, weight, metabolism, and bone growth.

Another Award of Citation was presented to Thomas J. Moore, 17, of Homewood, Illinois, who is a junior at St. Augustine Seminary, Holland. His work was about "The Extent of Subliminal Perception."

Presenting the awards was Milford O. Rouse, M.D., of Dallas, president of the AMA. James L. Lightbody, M.D., of Detroit, MSMS president-elect, represented Michigan physicians at the speakers table.

"Unwed Mother" Topic July 25-26 For Coller Event

One of the highlights at the 48th Annual Coller-Penberthy-Thirlby Medical Conference at Traverse City, July 25-26, will be a one-hour panel discussion on "The Unwed Mother."

The panel from 4 to 5 p.m., July 25, will spotlight three University of Michigan physicians—J. Robert Willson, M.D., professor and chairman of the Department of Obstetrics and Gynecology; William J. Oliver, M.D., professor and chairman of the Department of Pediatrics and Communicable Diseases, and Stuart M. Finch, M.D., professor of psychiatry and chief of Children's Psychiatric Service.

The annual conference will offer many nationally-known speakers from Michigan and across the nation.

James W. Hall, M.D., Traverse City, who is serving as chairman of the local committee on arrangements, will begin the conference with the official welcome at 9 a.m., July 25. Adjournment is scheduled for noon, July 26.

DETECTO
Doctor's scale

help tip the scales for your "should-but-can't" dieters...

☐ controls the appetite
☐ provides gentle 'lift' to strengthen patients' determination to stick to dietary instructions
☐ simple, easy-to-remember dosage
☐ special timed-release mechanism ensures smooth, uniform, 10-12 hour therapeutic effect
☐ proved clinically safe in over 80 million doses
☐ the preferred HCl salt for more available amphetamine

AMODEX®

TIMED CAPSULES

AMODEX® Timed capsules

Each AMODEX TIMED CAPSULE contains:

dextro-amphetamine HCl	15 mg.
amobarbital (barbituric acid derivative)	60 mg.

WARNING: may be habit forming

DOSAGE: One capsule on arising or at breakfast. Drugs are released gradually over 6 to 8 hours, providing therapeutic effect for 10 to 12 hours.

INDICATIONS: AMODEX Timed Capsules elevate the mood, relieve nervous tension, restore emotional stability and emotional capacity for physical and mental effort. AMODEX Timed Capsules are extremely useful in the treatment of anxiety states and may be used to control appetite in the management of the obese patient — without nervous excitation.

SIDE EFFECTS AND PRECAUTIONS: Frequent or continued use may cause nervousness, sleeplessness, or restlessness. Individuals suffering from high blood pressure, heart disease, diabetes, thyroid disease, lung ailments, or kidney disorders should not take this product. It should not be taken over a long period of time.

CONTRAINDICATIONS: Hyperexcitability, agitated pre-psychotic states. Sensitivity to Amphetamines or Barbiturates.

CAUTION: Federal Law prohibits dispensing without prescription.

SUPPLIED: In bottles of 30, 100, and 1000 capsules.

pharmaceuticals since 1866
Detroit, Michigan

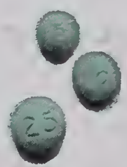
the "Librium® effect"

(chlordiazepoxide HCl)

For years, physicians have valued Librium (chlordiazepoxide HCl) capsules for their reliable calming effect.

(in capsules)

Now, the same dependable antianxiety effect can be obtained with convenient tablets—Libritabs (chlordiazepoxide).



(in Libritabs™)

(chlordiazepoxide)

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d. (See Precautions.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs™ (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

SEPTEMBER 25-26, DETROIT
1968 MSMS ANNUAL SESSION

SEPT. 25-26
is the time to participate in the 103rd MSMS Annual Session. Listen to medical authorities, participate in conferences, see the exhibits, enroll in a one-day course, visit with your confreers, attend a specialty session, have fun at the Annual MSMS Dinner Dance, etc., etc.

SEPT. 25-26
the time to enroll in one or two of the special day-long courses in "Infectious Diseases," "Pulmonary Diseases," "Blood Diseases," "Difficult Decision in Digestive Diseases." Courses will be limited.

SEPT. 25-26
is the time to see the latest advances in medical research, products, and equipment in the Exhibition Hall at the Sheraton-Cadillac. The exhibitors help make the Annual Session possible; and make valuable contributions to the MSMS postgraduate medical efforts.

SEPT. 25-26
is the time to take a break from your busy office and hospital, routines. Block out the dates now on your appointment calendar. Watch future issues of Michigan Medicine for more details.

PG REFRESHER COURSE - NO REGISTRATION FEE

Open-eyed nights

Too tense to sleep...too tired to get up. Early to bed, late to rise, and not much sleep at that, the patient with severe psychic tension is understandably tired. His tensions and overreactions to the day's stresses may interfere with proper sleep, and his inability to face the day's activities can produce an ever-worsening pattern. By relieving psychic tension, Valium® (diazepam) facilitates sleep, particularly with an h.s. dose. In many patients, the usefulness of Valium has been demonstrated in relieving psychic tension alone or with secondary depressive symptoms. Valium is generally well tolerated and, with proper maintenance dosage, usually does not unduly impair mental acuity or ability.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in: skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders; athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindications: Known hypersensitivity to drug; children under 6 months of age; acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in treatment of psychotic patients, and should not be employed in lieu of appropriate treatment. As with most CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increase in dosage of standard anticonvulsant medication; abrupt withdrawal in such cases may also be associated with temporary increase in frequency and/or severity of seizures. Advise patients against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance. Keep addiction-prone individuals (such as drug addicts or alcoholics) under careful surveillance because of their predisposition to habituation and dependence. Use of any drug in pregnancy, lactation or in women of childbearing age requires that potential benefit be weighed against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, carefully consider individual pharmacologic effects—particularly with known compounds which may potentiate action of Valium (diazepam), such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants. Employ usual precautions in the severely depressed or in those with latent depression; suicidal tendencies may be present and protective measures necessary. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation (initially 2 to 2½ mg once or twice daily, increasing gradually as needed or tolerated).

Adverse Reactions: Side effects most commonly reported: drowsiness, fatigue and ataxia. Infrequently encountered: confusion, constipation, depression, diplopia, dysarthria, headache, hypotension, incontinence, jaundice, changes in libido, nausea, changes in salivation, skin rash, slurred speech, tremor, urinary retention, vertigo and blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances and stimulation have been reported; should these occur, use of the drug should be discontinued. Because of isolated reports of neutropenia and jaundice, periodic blood counts and liver function tests are advisable during long-term therapy. Minor changes in EEG patterns (low-voltage fast activity) observed during and after therapy and are of no known significance.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 50, 100 and 500.

Many Articles

In every issue of MICHIGAN MEDICINE there are articles of value and interest to every MSMS member. Some members want scientific papers, others primarily want information about MSMS and its projects, others want to read about the activities of the many ancillary organizations, and still others have other special interests. This July issue and every issue offers a blend of all these articles. Comments are always invited from MSMS members as are original scientific articles.

DECLOSTATIN® 300 b.i.d.

Demethylchlortetracycline HCl 300 mg
and Nystatin 500,000 units
CAPSULE-SHAPED TABLETS Lederle

guard susceptible patients against intestinal monilial over-wth during broad-spectrum therapy—the protection of statin is combined with demethylchlortetracycline in CLOSTATIN.

'or your susceptible candidates, prescribe DECLOSTATIN ne broad-spectrum therapy that prevents monilial rgrowth.

traindication: History of hypersensitivity to demethylchlortetracy-e or nystatin.

-ning: In renal impairment, usual doses may lead to excessive accumu-on and liver toxicity. Under such conditions, lower than usual doses indicated, and, if therapy is prolonged, serum level determinations be advisable. A photodynamic reaction to natural or artificial sun-it has been observed. Small amounts of drug and short exposure may duce an exaggerated sunburn reaction which may range from ery-ma to severe skin manifestations. In a smaller proportion, photo-rgic reactions have been reported. Patients should avoid direct osure to sunlight and discontinue drug at the first evidence of skin comfort. Necessary subsequent courses of treatment with tetracy-nes should be carefully observed.

cautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken.

In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transien increase in urinary output, sometimes accompanied by thirst (rare) Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis Teeth—dental staining (yellow-brown) in children of mothers given thi drug during the latter half of pregnancy, and in children given the dru during the neonatal period, infancy and early childhood. Enamel hypo plasia has been seen in a few children. If adverse reaction or idiosyn crasy occurs, discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaire by the concomitant administration of high calcium content drugs, foo and some dairy products. Treatment of streptococcal infections sho continue for 10 days, even though symptoms have subsided.

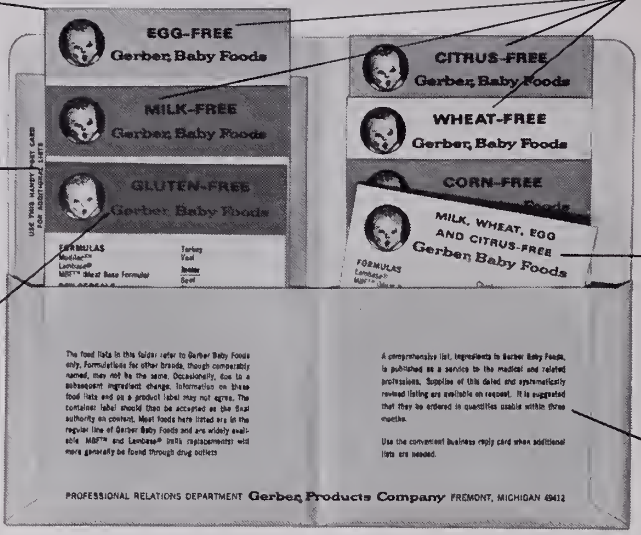
Pearl River, New York

Handy packet displays all lists at a glance.

Post-paid order card for additional lists.

An individual list of gluten-free foods.



The food lists in this folder refer to Gerber Baby Foods only. Formulations for other brands, though comparably named, may not be the same. Occasionally, due to a subsequent ingredient change, information on these food lists and on a product label may not agree. The container label should then be accepted as the final authority on content. Most foods here listed are in the regular line of Gerber Baby Foods and are widely available. MBF™ and Lambase® (milk replacements) will more generally be found through drug outlets

A comprehensive list, ingredients in Gerber Baby Foods, is published as a service to the medical and related professions. Supplies of this dated and systematically revised listing are available on request. It is suggested that they be ordered in quantities usable within three months.

Use the convenient business reply card when additional lists are needed.

PROFESSIONAL RELATIONS DEPARTMENT Gerber Products Company FREMONT, MICHIGAN 49412

Separate lists of foods free from four common allergens.

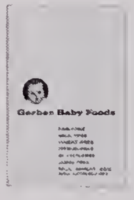
A list of foods free from milk, wheat, egg and citrus fruit.

Lists are revised frequently by Gerber nutritionists.

For the food allergic patient

Infant "Survival Kit"

Enables you to eliminate gluten, any one of five specific foods or a combination of four common allergens with ample selectivity for nutritional adequacy.



With these new Gerber food lists you can institute a variety of test diets based on strained or junior Gerber Baby Foods. All lists permit selection of a varied and nutritionally adequate diet. Even when you use Gerber foods free from the combination of milk, wheat, egg and citrus fruit, your infant patient is allowed two milk-free formulas, three different cereals, two juices and *thirty-five* Gerber strained foods. Toddlers, in addition, may receive nine fruits, five vegetables, six dinners (three are high-meat), plus a cereal-fruit combination and a dessert. A total of *twenty-seven* junior foods.

Two formulas for the milk-sensitive patient.
When using this exclusive Gerber nutrition plan, you have your choice of two superior formulas for adequate nutritional replacement of milk proteins and other nutrients: (1) Lambase,® the premodified formula containing 24.4 Gm. of lamb-based protein per quart, (2) MBF™ (Meat Base Formula, beef) the higher protein formula (27.5 Gm. per quart) that allows your choice of added carbohydrate modifier. Both are unexcelled in protein quality.

LAMBASE
MBF
Gerber
Gerber

Modilac™—a complete milk formula.
For the infant who is not sensitive to milk, Modilac, Gerber Baby Formula, supplies 21.6 Gm. of protein per quart when fed at the recommended dilution of 1:1. And, Modilac being of intermediate protein content, is not overly dilute in other essential nutrients derived from milk.

Compact and Comprehensive.
We suggest you ask your Gerber representative for your infant "Survival Kit." If you prefer, request a kit for each treatment room. It's a spacesaver and a timesaver, occupying a scant five inches on your desk and requiring less than a minute of explanation to the mother. When your supply of any list is exhausted, an additional minute allows you to complete the post-paid reorder form. Or keep in touch with your Gerber representative who will have latest revisions of all listings.

One thing to remember—these lists apply *only* to Gerber Baby Foods.

MSMS PRESIDENT'S MESSAGE

Through a United Voice

Have you heard the following question recently?

"Why should I belong to or be active in the AMA or MSMS?"

Perhaps you have.

I have.

And I've enjoyed discussing the question with some of the medical students, with some of the physicians under 39 and with some of those over 39. And I've had strong support from time to time from the students and from those both under or over the Jack Benny-age of 39.

My answer to the question and the supporting comments of many Michigan physicians seem to shape up this way:

> *Physicians are living in a social, economic and governmental climate which requires medicine to present the strongest, positive voice possible to state the profession's side to the hundreds of issues that are being discussed by the public, the educators, the students, the planners, the media, and the lawmakers.*

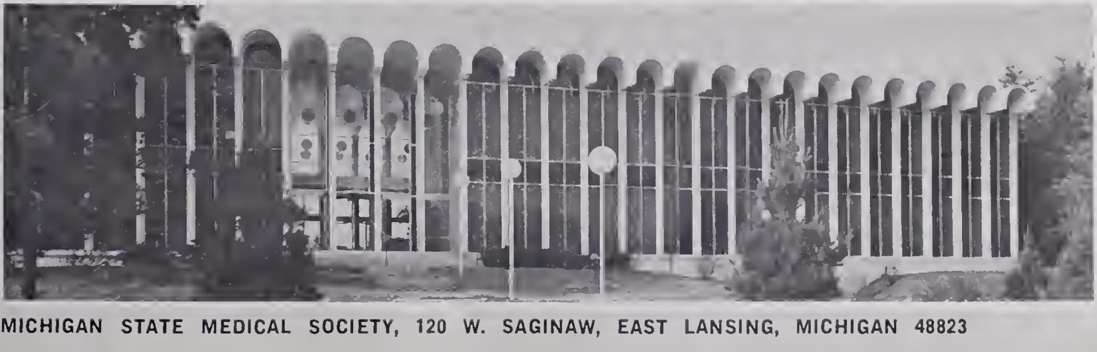
I hope you will agree with my answer, which in effect says, "in unity there is strength." Every physician through his county medical society, through MSMS, and through the AMA should raise questions and present his own point of view. He should have the opportunity to serve on committees, to strive to become an officer, to function as a delegate.

In our medical organization we must take advantage of the opportunity to debate the issues and to re-examine our philosophies. This is possible; and I hope can result in a minimum of public disagreements which dissipate the strength of our united voice, stand and action. A complete consensus is not possible; and probably not even desirable. But the issues must be studied, debated and tackled by physicians as professional men and women—well-educated and well-grounded in ethics.

We all have often repeated the famous quotation, "I disapprove of what you say, but will defend to the death you right to say it." This is my feeling too.

> *Physicians who treasure their opportunities to serve mankind and who love the profession will want to offer constructive suggestions and will work through the existing, democratic channels to bring about progressive changes.*

The AMA President, Milford O. Rouse, M.D., put many of my reactions together well in a speech recently when he said: "As physicians, we can best play our role in the continuing and increasing debate that is going on in this country regarding welfare, governmental power, and all other elements of our political, social and economic lives by working in unity, in harmony, and by focusing all our efforts into one main channel of communication through a united voice." □



MICHIGAN STATE MEDICAL SOCIETY, 120 W. SAGINAW, EAST LANSING, MICHIGAN 48823

Tofrānil®, imipramine hydrochloride

Indications: Tofrānil is recommended for the treatment of depressive states of diverse psychopathology.
Contraindications: The concomitant use of this agent and monoamine oxidase inhibiting (M.A.O.I.) compounds is contraindicated. Hyperpyretic crises or severe convulsive seizures may occur. Potentiation of adverse effects can be serious or even fatal. An interval of at least 7 days after M.A.O.I. therapy has been discontinued should be allowed before this drug may be substituted. Initial dosage should be low, increases should be gradual, and the patient's progress should be carefully observed.
Warning: Clinical reports have suggested that there may be a risk of teratogenesis associated with the use of this compound during the first trimester of pregnancy. Unless, in the opinion of the prescribing physician, the potential benefits outweigh the possible risks, it should not be used during the first trimester of pregnancy. Cardiovascular complications, including myocardial infarction and arrhythmias, have occasionally occurred in susceptible individuals. Patients with cardiovascular disease should be given the drug only under careful observation and in low dosage.
Precautions: Since suicide is always a possibility in severely depressed patients and one which may persist until significant remission occurs, such patients should be carefully supervised during early treatment. Some severely depressed patients may also require hospitalization and/or concomitant electroconvulsive therapy. Because of its anticholinergic effect, caution should be observed in prescribing the drug for patients with increased intraocular pressure.
In rare instances, transient cardiac arrhythmias have occurred in hyperthyroid patients and in patients receiving thyroid medication when this compound was added to the regimen.
Imipramine may block the pharmacologic activity of guanethidine and other related adrenergic neuron-blocking agents.
The drug is not recommended at the present time in patients under 12 ye of age.
Adverse Reactions: Dryness of the mouth, tachycardia, constipation, di turbances of accommodation, sweating, dizziness, weight gain, urinary frequency or retention, nausea and vomiting, peripheral neuritis, mild parkinson-like syndrome, tremors, rare cases of falling in elderly patients, confusional states (with such symptoms as hallucinations and disorientation), activation of psychosis schizophrenics and agitation (including hypomanic and manic episodes) which may require dosage reductio

Magna
cum
epression

For him, commencement.

For his mother, the beginning of his career may seem the end of hers. The end of feeling needed and useful. The beginning, perhaps, of a pathological depression.

Tofrānil can often relieve the symptoms of her depression. If it can relieve her mental anguish, you may be able to help her graduate into a new and fruitful life of her own.

Tofrānil could be her commencement, too.

Tofrānil® Geigy

imipramine
hydrochloride

in depression

The use of Tofrānil in patients receiving M.A.O.I.'s is contraindicated.

In patients with cardiovascular disease, hyperthyroidism or increased intraocular pressure; in those receiving anticholinergics (including antiparkinsonism agents), thyroid medication or adrenergic neuron-blocking antihypertensive agents; and in those in the first trimester of pregnancy, the precautions discussed in the Prescribing Information should be carefully observed. Although toxic reactions severe enough to require discontinuation of Tofrānil are uncommon, please refer to the Prescribing Information for a description of such instances when discontinuation may be necessary.

or addition of a tranquilizer or
porary discontinuation of the drug,
eptiform seizures, orthostatic
otension and substantial blood
sure fall in hypertensive patients,
ura, transient jaundice, bone mar-
depression including agranulocy-
, sensitization and skin rash
uding photosensitization, eosino-
a, and mild withdrawal symptoms
udden discontinuation after pro-
ed treatment with high doses.
asional hormonal effects (im-
nce, decreased libido, and estro-
c effects) may be observed.
pine-like effects may be more
iounced (e.g. paralytic ileus) in
ceptible patients and in those
g anticholinergic agents (includ-
antiparkinsonism drugs).
patient Adult Dosage: Initially,
ng. daily, increased, if necessary,
0 or 200 mg. Maintenance dosage
be lower, 50 to 150 mg. daily, if
sible.

Geriatric and Adolescent Dosage: Initially, 30 or 40 mg. daily, which may be increased according to response and tolerance. It is usually unnecessary to exceed 100 mg. daily. A lag in therapeutic response, lasting from a few days to a few weeks, should be expected. When dosage recommendations are already being followed, increasing the dosage does not normally shorten this latency period and may increase the incidence of adverse reactions. *Availability:* Round tablets of 25 and 50 mg.; triangular tablets of 10 mg. for geriatric and adolescent use; and ampuls, each containing 25 mg. in 2 cc. for I.M. administration.

Has Emergency Care Plan Been Tested?

BY BROCK E. BRUSH, MD, CHAIRMAN
MSMS PUBLIC RELATIONS COMMITTEE

"The MSMS component medical societies should take the leadership in developing an emergency medical care plan and in conducting an annual trial run."

That is a recent motion of the MSMS Committee on Public Relations that was approved by the MSMS Council, and thus routed to the 55 component societies across the state.

Many of the county medical societies have helped to develop workable patterns to provide medical care in case of any disaster. The need for an emergency plan can face any community in Michigan when we consider the growing possibilities of multiple car accidents; train, bus or airplane accidents, tornado or other weather problems; industrial mishaps; fires, etc.

The second part of the emergency care concern voiced above rates special attention. It is fine to have a plan on paper — but it is essential that the medical profession be sure that there is "an annual trial run." Some of the counties fortunately have found weaknesses in the on-the-paper-only plans, and have been able to correct them after a test.

The county medical society — because the physicians are the only ones that can provide the medical treatment that would be needed during and after an emergency — should anticipate such a situation and should gather together the appropriate agencies and persons to perfect an emergency medical care organization. The physicians will want to get the advice and involvement of the city governmental officials, communication executives, ambulance services, the scouts and other volunteer helpers, etc.

In developing a pattern, these people will want to explore all the needs for blood banks, blood substitutes, bandages and dressings, drugs, stretchers, respirators, etc. The plans for facilities should include not only the hospitals but also the school gymnasiums, military armories, etc.

To be sure that the injured will receive the right treatment and care, it would be well to select a triage officer who would decide upon the urgency of the cases and would establish priorities.

The county medical societies which have good plans already tested in 1968 can consider many related projects. One of the good complimentary activities would be for the medical society to sponsor a seminar on trauma — or a workshop on shock — and thus provide information and experience for the many ancillary people who are always needed when emergencies do arise.

Physicians are eager to provide prompt and efficient handling of every emergency victim — and the component societies must assume the responsibility of organizing the total team and testing it for functional flaws. ☐

Who Carries on Now On Manpower Report?

BY ROBERT J. MASON, M.D., CHAIRMAN
THE MSMS COUNCIL

Surely you have read many articles recently about the Report of the National Advisory Commission on Health Manpower. I certainly have.

Newspapers have picked up some of the more spectacular aspects, some social planners dismiss it as too mild, and the medical profession has approved and agreed with many of the proposals in the Report.

Today, we ask "who carries on from here?"

THE PANEL OF EXPERTS who conducted the study and wrote the Report has completed its work.

The physicians or medical profession really can't implement all the recommendations alone.

Then who should?

PERHAPS ONE PORTION of the Report itself provides a possible answer. In part the Report declares:

> *"There is a crisis in American health care. Unless we improve the system through which health care is provided, care will continue to become less satisfactory, even though there are massive increases in cost and in numbers of health personnel. This report, therefore, deals primarily with what can and should be done now. . . .*
>
> *"At first blush, this might sound as if we are about to propose the creation of a master Federal plan for national health care. Not so. We are convinced government alone is not big enough to solve the problems of health care for the American people. Our recommendations require that the resources of each*

of these powerful forces (the professions, voluntary agencies, religious and educational institutions, hospitals, organized labor, business and industry, and concerned citizens) be applied to reshape effectively the health care system."

Maybe the suggestions are in the last sentence? If the problems of health manpower and health care must be solved, then the medical profession must be involved and must take the leadership. We cannot, however, dismiss the possible contributions by many other forces. Medicine, it seems to me, cannot ignore the potential good that a coalition of physicians, nurses, technicians, social workers, voluntary agency officials, governmental executives, and other interested parties.

AMA President-Elect Dwight Wilbur, who served as a member of the Commission, has suggested that the Report will serve as a major basis for future legislation dealing with health care.

THE OPPORTUNITIES ARE here for medicine and the individual physician to become informed about the recommendations of the Report, and to get involved in seeking solutions to the many problems facing the physician and the patient alike.

Who can really understand the problems better than physicians and actively seek workable solutions? The Report provides a framework that can be altered and modified.

Who carries on from here? ☐

AMA Legislative Challenge "Never So Formidable"

BY DONALD E. WOOD, M.D., CHAIRMAN
AMA COUNCIL ON LEGISLATIVE ACTIVITIES
INDIANAPOLIS, INDIANA

Never before has the task for the AMA Council on Legislative Activities been so formidable as it is today.

And never before has this scope of AMA activities been so strong a reason for every physician to belong to the AMA.

Under the "Great Society," a once-steady stream of 300-or-so bills has swelled into a torrent of proposed legislation that has severely challenged the energies of the Council members and their nine-member AMA staff, which includes three attorneys, one a legislative attorney permanently assigned to the Washington Office.

KEEPING TRACK OF whatever pops into the Capitol Hill legislative hopper that can have any direct or indirect bearing on the medical profession or public health long has been an obligation

BRIGHTON HOSPITAL

A non-profit foundation

FOR ALCOHOLISM

Member, Michigan Hospital Association

Brighton, Michigan
ACademy 7-1211

Say you saw it in Michigan Medicine

carried out by the American Medical Association on behalf of the medical profession.

Through the years this task has been performed by the AMA's Council on Legislative Activities, 13 perspicacious physicians appointed by the Board of Trustees, and its predecessors — the Bureau of Legal Medicine and Legislation and, prior to 1924, the Council on Health and Public Instruction.

ALMOST OVERNIGHT HEALTH care has been catapulted into a position of paramount national concern. The successes of American medicine have led to an increasing demand, and there has been a pervasive search for ways to obtain more health care services through legislation.

The legislative statistics clearly speak for themselves. During the 88th Congress (1963-1964), for example, the AMA Council and its staff analyzed 860 bills of medical interest. Before the 89th Congress adjourned in 1966, that record activity on health legislation was paltry in comparison. In that session attention was focused on 1,526 bills. And in the first session of the 90th Congress (1967) another 1,127 bills had gone into the hopper.

This surge of legislative activity is reason enough to again focus attention upon the roles carried out by the Council in the interests of organized medicine. Since laws are drafted by legislators and others who seldom are experts in the areas their bills seek to cover, it is imperative that the proposals be weighed and judged by those whom they would directly affect — in this case, physicians and their patients.

AS REPRESENTATIVES OF the medical profession, members of the AMA Council and their staff have the responsibility of scrutinizing each bill of medical interest, striving to determine its strengths, its weaknesses, its immediate and long-range effects, its ramifications and subtle implications, if any.

After obtaining the expert views of many interested parties, the Council makes recommendations to the Board and these, sometimes, compel the need for policy-making decisions on matters of significant import.

Matters of the greatest interest to the profession occur in broad areas affecting medical education, medical practice, construction of health or teaching facilities and provision of medical services.

To effectively present the case for or against proposed legislation expert physician and non-physician witnesses are summoned to present AMA testimony before Congressional committees and sub-committees. During the first session of the 90th Congress, the Council developed 16 statements concerned with 11 legislative proposals. Of these

11 legislative issues, the Association favored six, opposed two and voiced partial support or opposition — or suggested an alternative approach — to the remaining three.

Even after laws are passed, the AMA Council continues to seek modifications which it deems to be in the best interest of the public and the profession. ☐

Patience, Understanding, Loyalty, and Work

BY W. G. GAMBLE, JR., M.D.,
EDITOR, BAY-ARENAC-IOSCO

One cannot afford not to participate in so-called political medicine. If one expects to avoid some of the changes that bureaucracy is imposing upon us from the state and national levels. It is our duty, each and every one of us, also the members of the Auxiliary, to extend a helping hand in advising others on health care. Fight for what you think is right but also accept the inevitable in some cases.

We cannot always afford to be "agin" everything. We must have an alternate constructive plan of our own. Hospitals all over the land are encroaching a certain amount on the practice of medicine and some of these we cannot help. To others, we should be sympathetic and to other problems we should offer constructive solutions.

It is well for us to remember that those whom you have placed in office and have appointed you on certain committees should assume these duties and feel honored. Prepare to serve in these capacities. Practicing a policy of going into a corner and sulking is of little value. In other words, if you don't play it my way, I won't play. Physicians are supposed to be intellectuals.

Unless we furnish constructive, sympathetic leadership in health care, other powers that be may step in and tomorrow may be too late. Destructive criticism of your fellow physician is lethal poison to all physicians. As there is enough sickness in our land to provide us with a comfortable living, we should extend a helping hand to each other and then help the community as a whole.

The title of this was "Patience, Understanding, Loyalty, and Work." One cannot predict a rosy future and medicine will not go on the next few years as it has gone on in the past. Give of yourself "so that the bread you have cast upon the waters may return to you ten-fold."

(Note: the above is quoted from the Bay-Arenac-Iosco Bulletin. Doctor Gamble is the editor.) ☐

INGRAM'S SERVICE DEPARTMENT

ALL FACTORY TRAINED MEN

We service Medical Equipment, Electrocardiographs, Basal Metabalors, Sterilizers, Autoclaves, Diathermy Outfits, Cutting Units, Ultra Violet Lamps, Hydro Therapy Units, Laboratory Equipment. ALL BURDICK, LIEBEL FLARSHEIM AND RITTER EQUIPMENT.

If you have any Service problems, please call us at TE 2-4444, ask for the SERVICE DEPARTMENT and we will gladly help in any way we can.

Scientific Contributions, Suggestions Welcomed

BY JOHN W. MOSES, M.D.
SCIENTIFIC EDITOR

With the multiplicity of journals and subspecialty journals extant, one might consider the role and/or necessity of state society journals.

To many individuals the state society journals still have significant functions. These functions embrace two aspects, (1) Informational and (2) Scientific.

AT THE PRESENT time the medical profession and allied fields are in the midst of a revolution. We are buffeted by socio-politico-economic and other changes. The state society journal is the best means available of keeping our members aware of the changes and proposed changes in these spheres. With awareness of the total picture our members should be in a better position to make proper decisions and play an active role.

Similarly, we all tend to lead a rather insular existence. The state journal is a means of educating our members as to what is going on in other parts of our state, what various groups are thinking and doing, and what facilities are available in other parts of our state.

We are all aware that MSMS has committees and elected representatives who work hard in our behest, although we are not equally aware of what they are doing. The state journal is a means of disseminating information pertaining to the activities of these groups.

FROM THE SCIENTIFIC aspect the state journals have a great deal to offer. It is true, one does not expect to find the discovery of the year in a State Society Journal. Inasmuch as most members of our society have their usual scientific journals depending on their individual needs, the state society journal should give a little bit to everybody. The reader should get an insight into ob-gyn, ophthalmology, psychiatry, public health, etc. All groups should expect to get a generalized view of the total medical picture and have a better understanding of all modalities.

The scientific section should give our members an opportunity to whet their writing tools and build a bibliography.

The state journal should be a means of making people, locally and nationally, aware of the medical advantages of the area. This can boost the state medically and entice younger men to settle and practice in the state. The state journal is a place to express our pride in the medical fraternity and facilities we have.

WE INTEND TO appoint a group of associate editors hoping thereby to involve more of the universities, regional areas and subspecialty groups to make *Michigan Medicine* truly a state-wide journal.

As Scientific Editor, I welcome your scientific contributions and would be happy to have your suggestions to make *Michigan Medicine* the foremost state medical journal. ☐

MD on Hospital Boards Really a Local Issue

BY BROOKER L. MASTERS, M.D.,
CHAIRMAN, PUBLICATION COMMITTEE

Several months ago, MSMS President B. M. Harris, M.D., wrote a President's Message about the need for physicians on hospital boards of directors.

We know that the MSMS and the AMA has taken such a stand. We know too, that the recent Report of the President's National Advisory Commission on Health Manpower made the same assertion.

But this problem, to a large degree, must be tackled by physicians at the local level.

WHEN ARE WE GOING to begin to let people know that the local hospital governing board with no physician member is not soundly constituted?

The residents of the local community and the leaders who select the hospital board members would not do business with a bank that had no bankers on its board of directors.

WHY DO MOST LOCAL hospitals in Michigan — and the nation — continue to be directed by governing boards which includes no one who is qualified to operate a medical institution or to practice medicine?

Within the walls of the hospital where we practice we should be able to make our voice heard . . . within the same walls the best possible medicine must be practiced in the best possible conditions.

AGAIN I ASK, HOW can a governing board formulate hospital policies and make management decisions to provide the best possible conditions for medical care — when participation by the very individuals knowledgeable in the practice of medicine is merely advisory?

Physicians must continue to seek a voting seat on the local hospital board of managers. And physicians must find other local people willing to listen to the cold logic of the positions taken by MSMS, the AMA and the recent National Advisory Commission. ☐

Speaking of Malpractice Insurance....

Have you checked the advantages of insuring with Shelby Mutual Insurance Company? This plan is sponsored by Michigan Association of the Professions and is available to members of the Michigan State Medical Society.

Here is why it might be beneficial for you to investigate

* Very Broad Coverage

* Competitive Premiums as Shown Below

Limits	Class 1	Class 2	Class 3	Class 4	Class 5	Premises Minimum Premium
100/300,000	$97.00	$170.00	$292.00	$389.00	$486.00	$33.00

(Premises Coverage Required with Professional Liability)

Class 1 — PHYSICIANS — No surgery.

Class 2 — PHYSICIANS — Minor surgery or assisting in major surgery on own patients.

Class 3 — SURGEONS — General practitioners who perform major surgery or assist in major surgery on other than own patients.

Class 4 — SURGEONS — Specialists.

Class 5 — SURGEONS — Specialists — Anesthesiologists, Neurosurgeons, Obstetricians-Gynecologists, Orthopedists, Otolaryngologists.

Write for complete information as to coverage and premiums.

(Note: The AMA News *recently reprinted a* Michigan Medicine *editorial by George H. Lowrey, M.D., about foreign doctors. The following letter was received from a foreign physician now in New York City.)*

Dear Dr. Lowrey

I would like to express my sincere appreciation for your comments regarding foregin doctor in AMA *News;* I must say this is the first time for me to know there are some reasonable people in the field of medicine.

AS you know in the other professional field ex. in the arts if you speak with accent they will consider this as an expression of elite. Please don't misunderstand that I am try to put foregin doctor as an elite. I agree 100% with you that there should not have prejudice against us. It is easy to say but it takes a great man like you to express in public.

Sincerely yours
A foreign M.D.

Recently, I had the unpleasant experience of attempting to train a new "Girl Friday" in all office procedures, and found that I learned a great deal about why secretarial paper work is so time-consuming. The time involved in completing the most frequently used insurance forms appears to be inexcusable, and probably remediable to some extent.

Blue Shield, Medicaid, and Medicare forms all involve a great deal of copying of numbers, in addition to the patient's (or subscriber's) name and address. Not only is this subject to error in transcription, but the information must be recorded on several lines, and in no relation to the order in which the name, numbers, etc. is set forth on the identification card issued to the patient. And this is all in addition to considerable medical information which may or may not have any bearing on the claim, and which may be repetitious.

I would strongly urge that the State Medical Society insist that something be done to make matters easier, for both physician and his secretary. I would propose that each patient be issued a plastic identification card, that contains all the necessary information for processing a claim, and that can be run through a franking machine like an oil company or any other credit card, onto the insurance claim form (be it Blue Shield, State, or Federal Assistance Program). This would obviously eliminate error in transcription of names and numbers, and could save 5-10 minutes per form. The identification cards should be designed so that a single franking machine would handle all kinds.

The alternative to improvement in the present system would be unpleasant: either a charge to the patient for filling out unnecessarily cumbersome forms or refusal to process them.

Mark C. Levine, M.D.
Flint

I recently read the editorial in the March, 1968 issue of the Michigan State Medical Society Journal and was pleased to see the stand the State Society is taking on the proposed four-year medical school at Michigan State University.

On behalf of all of my colleagues here I thank all of you for your support of the MSU College of Human Medicine. We look forward in the years ahead to considerable cooperation in further broadening and improving the delivery of health care to the citizens of the State of Michigan.

It has now been well over a year since the State Board of Education recommended to the Governor and to the Legislature the approval of the clinical years, but the legislative action has not yet occurred. We hope that it will come about before too long in order that we might produce more practicing M.D.'s for the citizens of our state.

Again, thank you very much.

Howard R. Neville, Provost
Michigan State University

I was impressed with the very nice February issue of the Michigan State Medical Society Journal which did a very nice job in presenting some of the problems in Viet Nam. I am sure your work has acted as a good stimulus for further thought about the medical aid situation and probably will interest physicians in volunteering. Keep up the good work.

Alfred B. Swanson, M.D.
Grand Rapids

Congratulations on the great improvements you are bringing forth in the *Michigan State Medical Journal*. The book certainly would have to rank among the top five of all the state books, if not higher.

—Russell F. Staudacher,
Executive Director
Student American Medical Association

Photo professionally posed.

No injection after all!

This penicillin produces high, fast levels—orally.

Pen•Vee® K is usually so rapidly and completely absorbed that therapeutic penicillin levels are attained within 15 to 30 minutes. Thus it can often obviate the need for penicillin injections. The higher serum levels produced generally last longer than with those of oral penicillin G.

Indications: Infections susceptible to oral penicillin G: prophylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.
Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.
Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.
Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.
Adverse Reactions: (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").
Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

Wyeth Laboratories Philadelphia, Pa.

ORAL PEN•VEE® K
(potassium phenoxymethyl penicillin) Wyeth

NEW MEMBERS

Members of the Michigan State Medical Society join in welcoming the following new members into a progressive state medical organization. MSMS is dedicated to promote the science and art of medicine, the protection of the public health, and the betterment of the medical profession. Each new member is encouraged to join with other MSMS members at both the local and the state levels in achieving these goals.

et's be specific about Campbell's Soups... and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

Campbells
CONDENSED
SOUP

burning
itching
discharge
of trichomonal vaginitis...

Flagyl® tablets/inserts

rand of

metronidazole

brings

- clinical cures
- microscopic cures
- culture cures

For the most widespread form of vaginitis the most widely successful therapeutic agent, Flagyl, is clearly indicated.

In trichomonal vaginitis, most physicians have reported a cure-rate of 95 per cent or more with Flagyl when infected male partners are treated concurrently and when treatment is repeated for occasional refractory infections in women.

Among the few patients who do not respond to Flagyl are those who may not have taken the prescribed dosage and those who may have been reinfected.

This high rate of cure obtained with Flagyl is unparalleled. Only systemically active Flagyl reaches the hidden reservoirs of reinfection in male and female genitourinary tracts.

Indications: Flagyl is indicated only in the treatment of trichomoniasis in both the male and female.

Contraindications: Pregnancy; disease of the central nervous system; evidence or history of blood dyscrasia.

Precaution: Complete blood cell counts should be made before, during and after therapy, especially if a second course is necessary.

Side effects: Infrequent and minor side effects include nausea, metallic taste and furry tongue. Gastrointestinal disturbances, flushing and headache sometimes occur, especially with concomitant ingestion of alcohol. The taste of alcoholic beverages may be altered. Other effects, all reported in an incidence of less than 1 per cent, are diarrhea, dizziness, vaginal dryness and burning, dry mouth, rash, urticaria, gastritis, drowsiness, insomnia, pruritus, sore tongue, darkened urine, anorexia, vomiting, epigastric distress, dysuria, depression, vertigo, incoordination, ataxia, abdominal cramping, constipation, stomatitis, numbness or paresthesia of an extremity, joint pains, confusion, irritability, weakness, cystitis, pelvic pressure, dyspareunia, fever, polyuria, incontinence, decreased libido, nasal congestion, proctitis and pyuria. Elimination of trichomonads may aggravate candidiasis.

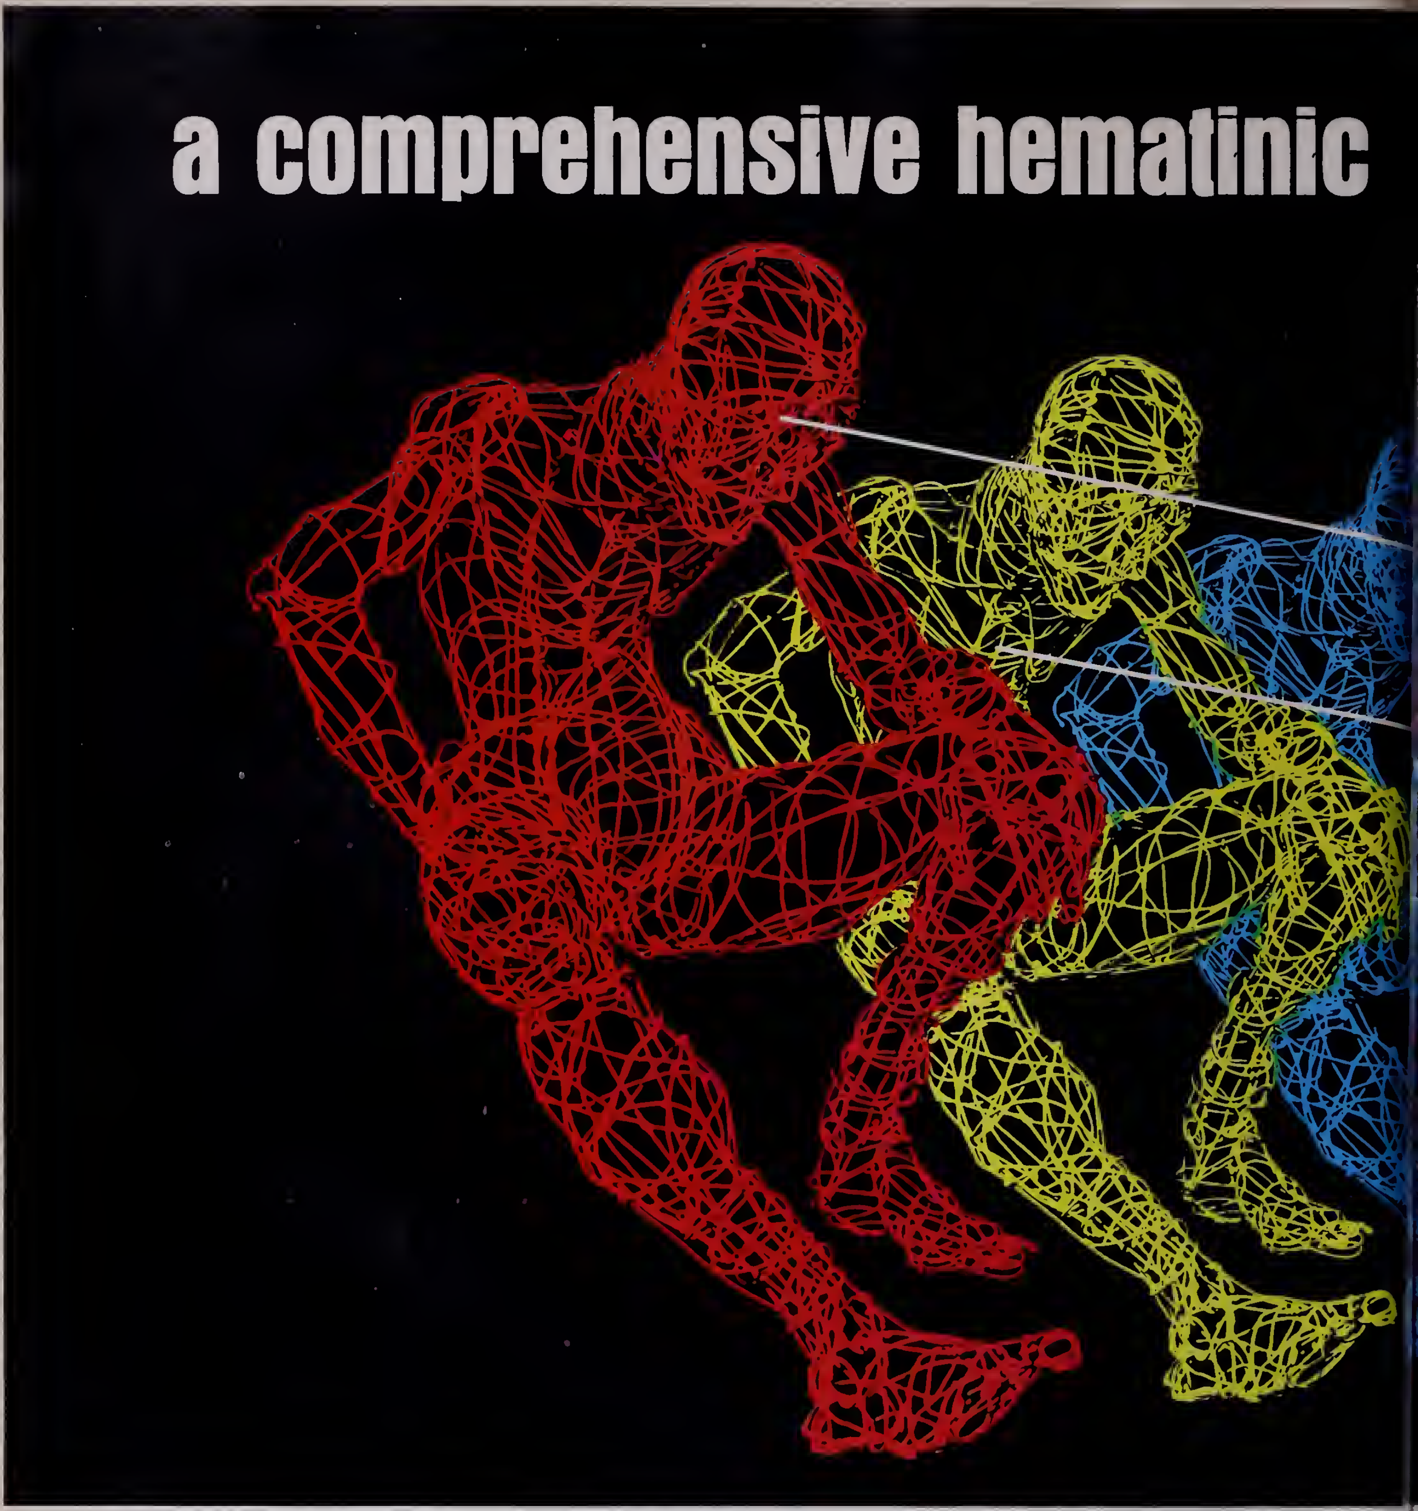
Dosage and Administration: In women: one 250-mg. oral tablet three times daily for ten days. A vaginal insert of 500 mg. is available for local therapy when desired. When used, one vaginal insert should be placed high in the vaginal vault each day for ten days; concurrently two oral tablets should be taken daily.

In men: When trichomonads are demonstrated, one 250-mg. oral tablet twice daily for ten days in conjunction with treatment of his female partner.

Dosage Forms: Oral tablets–250 mg.
Vaginal inserts–500 mg.

SEARLE

Research in the Service of Medicine



Description: Each Pulvule® contains—

Special Liver-Stomach Concentrate, Lilly (containing Intrinsic Factor)	150	mg.
Cobalamin Concentrate, N.F., equivalent to Cobalamin (The total vitamin B_{12} activity in the Special Liver-Stomach Concentrate, Lilly, and the Cobalamin Concentrate, N.F., is 15 micrograms.)	7.5	mcg.
Iron, Elemental (as Ferrous Fumarate)	110	mg.
Ascorbic Acid (Vitamin C)	75	mg.
Folic Acid	1	mg.

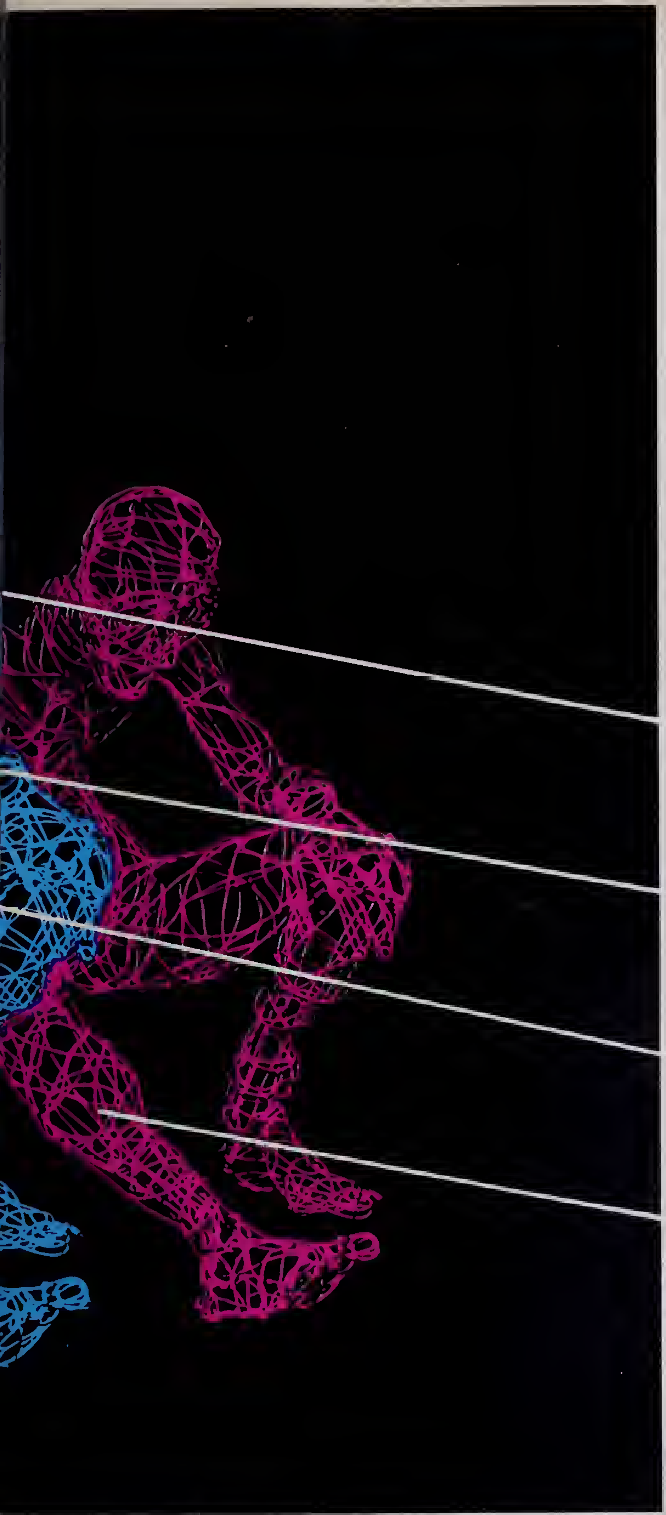
Indications: Trinsicon® (hematinic concentrate with intrinsic factor, Lilly) is a multifactor preparation effective in the treatment of anemias that respond to oral hematinics, including pernicious anemia and other megaloblastic anemias and also iron-deficiency anemia.

Contraindications: Hemochromatosis and hemosiderosis.

Precautions: Anemia is a manifestation that requires appropriat investigation to determine its cause or causes.

In pernicious anemia, the use of folic acid without adequat vitamin B_{12} therapy may result in hematologic remission but neu rological progression. Adequate doses of vitamin B_{12} (parentera or oral with potent intrinsic factor as in Trinsicon® [hematini concentrate with intrinsic factor, Lilly]) usually prevent, halt, c improve the neurological changes.

As with all preparations containing intrinsic factor, resistanc may develop in some cases of pernicious anemia to the potentia tion of absorption of physiological doses of vitamin B_{12}. If resis ance occurs, parenteral therapy, or oral therapy with so-calle massive doses of vitamin B_{12}, may be necessary. No single reg men fits all cases, and the status of the patient observed i follow-up is the final criterion for adequacy of therapy. Periodi



You can treat combined deficiencies with

Trinsicon®

—the multifactor hematinic

Vitamin B_{12} plus intrinsic factor (15 mcg. B_{12} activity)—helps provide adequate levels of this important vitamin.

Folic acid (1 mg.)—treats nutritional macrocytic anemias and/or malabsorption syndromes.

Ascorbic acid (75 mg.)—augments the conversion of folic acid to its active form and helps iron absorption.

Iron (110 mg.)—treats hypochromic anemia.

clinical and laboratory studies are considered essential and are ecommended.

Adverse Reactions: In rare instances, iron in therapeutic doses produces gastro-intestinal reactions, such as diarrhea or constipation. Reducing the dose and administering it with meals will minimize these effects.

In extremely rare instances, skin rash suggesting allergy has followed oral administration of liver-stomach material. Instances of apparent allergic sensitization have also been reported after oral administration of folic acid.

Dosage: One Pulvule twice a day. (Two Pulvules daily produce a standard response in the average uncomplicated case of pernicious anemia.)

How Supplied: Pulvules Trinsicon® (hematinic concentrate with intrinsic factor, Lilly), in bottles of 60 and 500. [032568]

Tower of Babble

Are your patients confused by ad claims?
by shapes and sizes? by strange-
sounding ingredients?
When they need fast
relief from pain, you
can reassure them that
aspirin is still the
strongest analgesic they
can buy without your
prescription. And
Bayer is 100% aspirin.
No wonder Bayer works wonders.

In peptic ulcer:

the antacid puzzle

solved by **Mylanta**®

aluminum and magnesium hydroxides *plus* simethicone

"will it ease the pain?"

Mylanta helps relieve ulcer pain with the two most widely prescribed antacids: aluminum and magnesium hydroxides.

will it help "my gassy stomach"?

Mylanta *also* contains simethicone: for concomitant relief of G.I. gas distress.

"will this one taste O. K.?"

The *prolonged* acceptance of Mylanta was recently confirmed in 87.5% of 104 patients—after a total of 20,459 documented days of therapy.* *Danhof, I. E.: Report on file.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. *Dosage:* One or two tablets (well chewed or allowed to dissolve in the mouth) or one or two teaspoonfuls to be taken between meals and at bedtime.

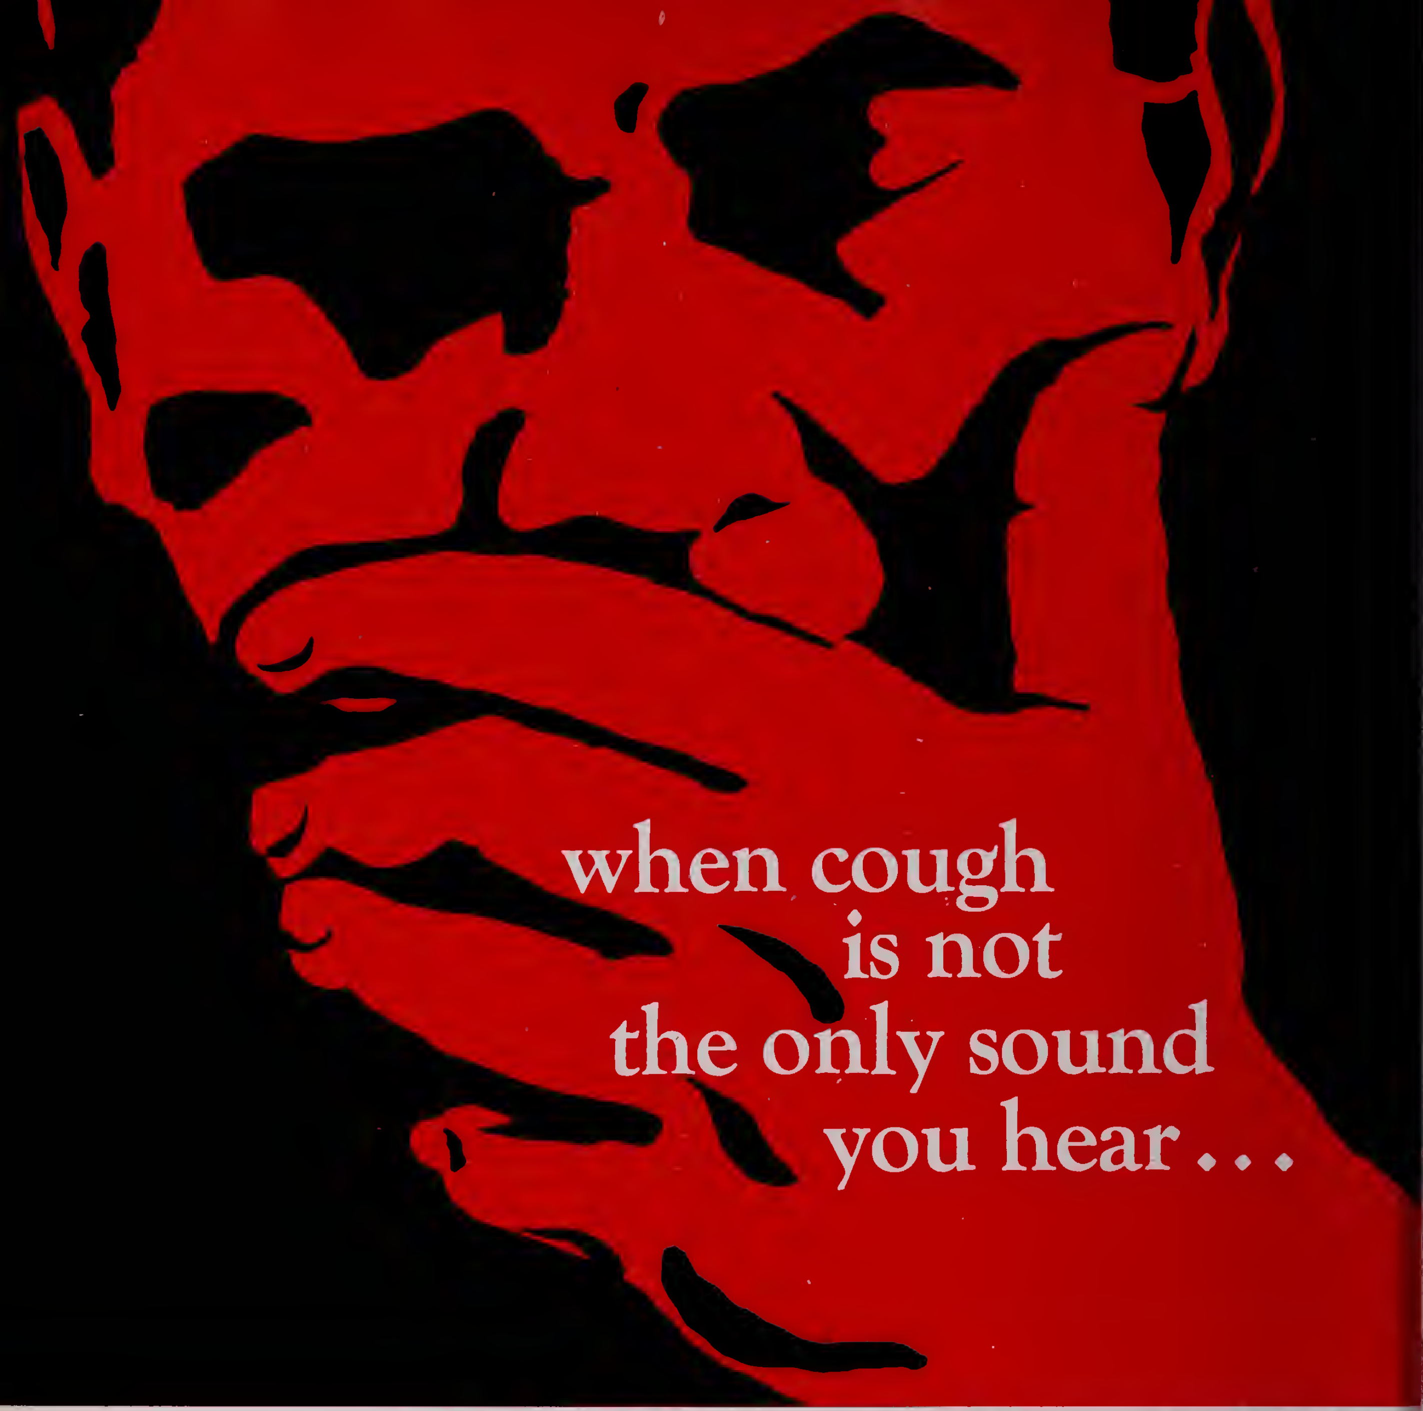
Division/Pasadena, Calif.
ATLAS CHEMICAL INDUSTRIES, INC.



OMNI-TUSS® b.i.d.

. . . **because** OMNI-TUSS is indicated for cough associated with upper respiratory tract infections, bronchitis, bronchiectasis, bronchial asthma, emphysema, sinusitis and rhinitis, hay fever, or other allergic conditions. Any of these conditions may exhibit the general symptom syndrome—coughing, wheezing, bronchospasm, and tenacious mucus—which may benefit from the antitussive, bronchodilative, antihistaminic, and expectorant action of Omni-Tuss.

The therapeutic usefulness of Omni-Tuss is enhanced by a unique resin complex formulation providing the clinically desirable advantages of: (1) uniform drug availability throughout an extended period, (2) 8 to 12 hours of symptomatic control, (3) minimal dosage requirement, (4) minimal side effects.

Economical, efficient **b.i.d.** dosage—extremely well-tolerated by children, 6-12, and adults.

'Omni Tuss' Suspension: Each teaspoonful (5 cc.) contains 10 mg. codeine (Warning: May be habit-forming), 5 mg. phenyltoloxamine, 3 mg. chlorpheniramine, 25 mg. ephedrine, all as cation exchange resin complexes of sulfonated polystyrene, and 20 mg. guaiacol carbonate.

Available on prescription only. Class X exempt narcotic. Permissible on oral prescription.

Dosage: *Adults:* 1 teaspoonful (5 cc.) q12h.
Children (6-12 *years*): ½ teaspoonful q12h.

Side Effects: Minimal, but when encountered may include jitteriness, nausea, drying of mouth, insomnia, constipation, which disappear upon adjustment of the dose or discontinuance of treatment.

Precautions and Contraindications: For complete detailed information, refer to package insert or official brochure.

In Obesity,
anorectic action
with fewer unwanted
side effects

CYDRIL®
(levamfetamine succinate TUTAG)

Cydril at 2 p.m.
Appetite control at 6
Sleep at 10

Action and Uses: Cydril (levamfetamine succinate) is a chemopharmaceutical approach to aid the obstinately obese. Cydril (levamfetamine succinate) provides the appetite depressant action of amphetamines but exhibits fewer unwanted side reactions.

Dosage: Adults and 'teenagers', one (1) Cydril (levamfetamine succinate) Granucap* daily.

Side Effects: Occasionally cardiovascular and gastrointestinal reactions may produce dry mouth, metallic taste, anorexia, nausea, diarrhea, headache, chilliness, pallor or flushing, sweating, diuresis, and arrhythmias.

Contraindications: Cydril (levamfetamine succinate) should not be used in the presence of severe hypertension, angina pectoris, hyperthyroidism, and Raynaud's disease.

*Granucap is the Tutag brand of sustained release capsule manufactured to release the contents over a period of approximately 6 to 10 hours.

Caution: Federal law prohibits dispensing without prescription.

Full product information available on request or see page 1122 in your 1967 PDR.

So Drop Dead at 25

FROM LOUISVILLE COURIER-JOURNAL

(Note: The following editorial was originally carried by the Louisville Courier-Journal and understandably has been reprinted many times. We thought our MSMS members would enjoy it. —B. M. Masters, M.D.)

While the FCC is berating television for its cigarette commercials, we wish it would look into another aspect of TV ads aimed not at corrupting the youth but at demoralizing the adult. In TV commercials, nothing good happens to anyone past the age of discretion. Life not only doesn't begin at 40, it ends at 25.

Watch the people in these ads for a while. Teenagers invariably have great, glistening teeth. Adults have dentures and denture breath. Boys switch hair grease and girls are glad. Men don't have hair. If they do, it is full of dandruff.

BOYS DOUSE THEMSELVES with shaving lotion and wait to beat off the women, like traps full of cheese. Older men are happy to find something that drains all eight sinuses.

Young people have fun. Older people have nagging headaches. Young people spend all night wolfing hamburgers at amusement parks or beach parties. Older people go to a nearby movie and have to leave because their stomach is killing them. Girls have yards of blonde hair full of body and boys nuzzle it. Wives have gray hair and their husbands won't take them dancing.

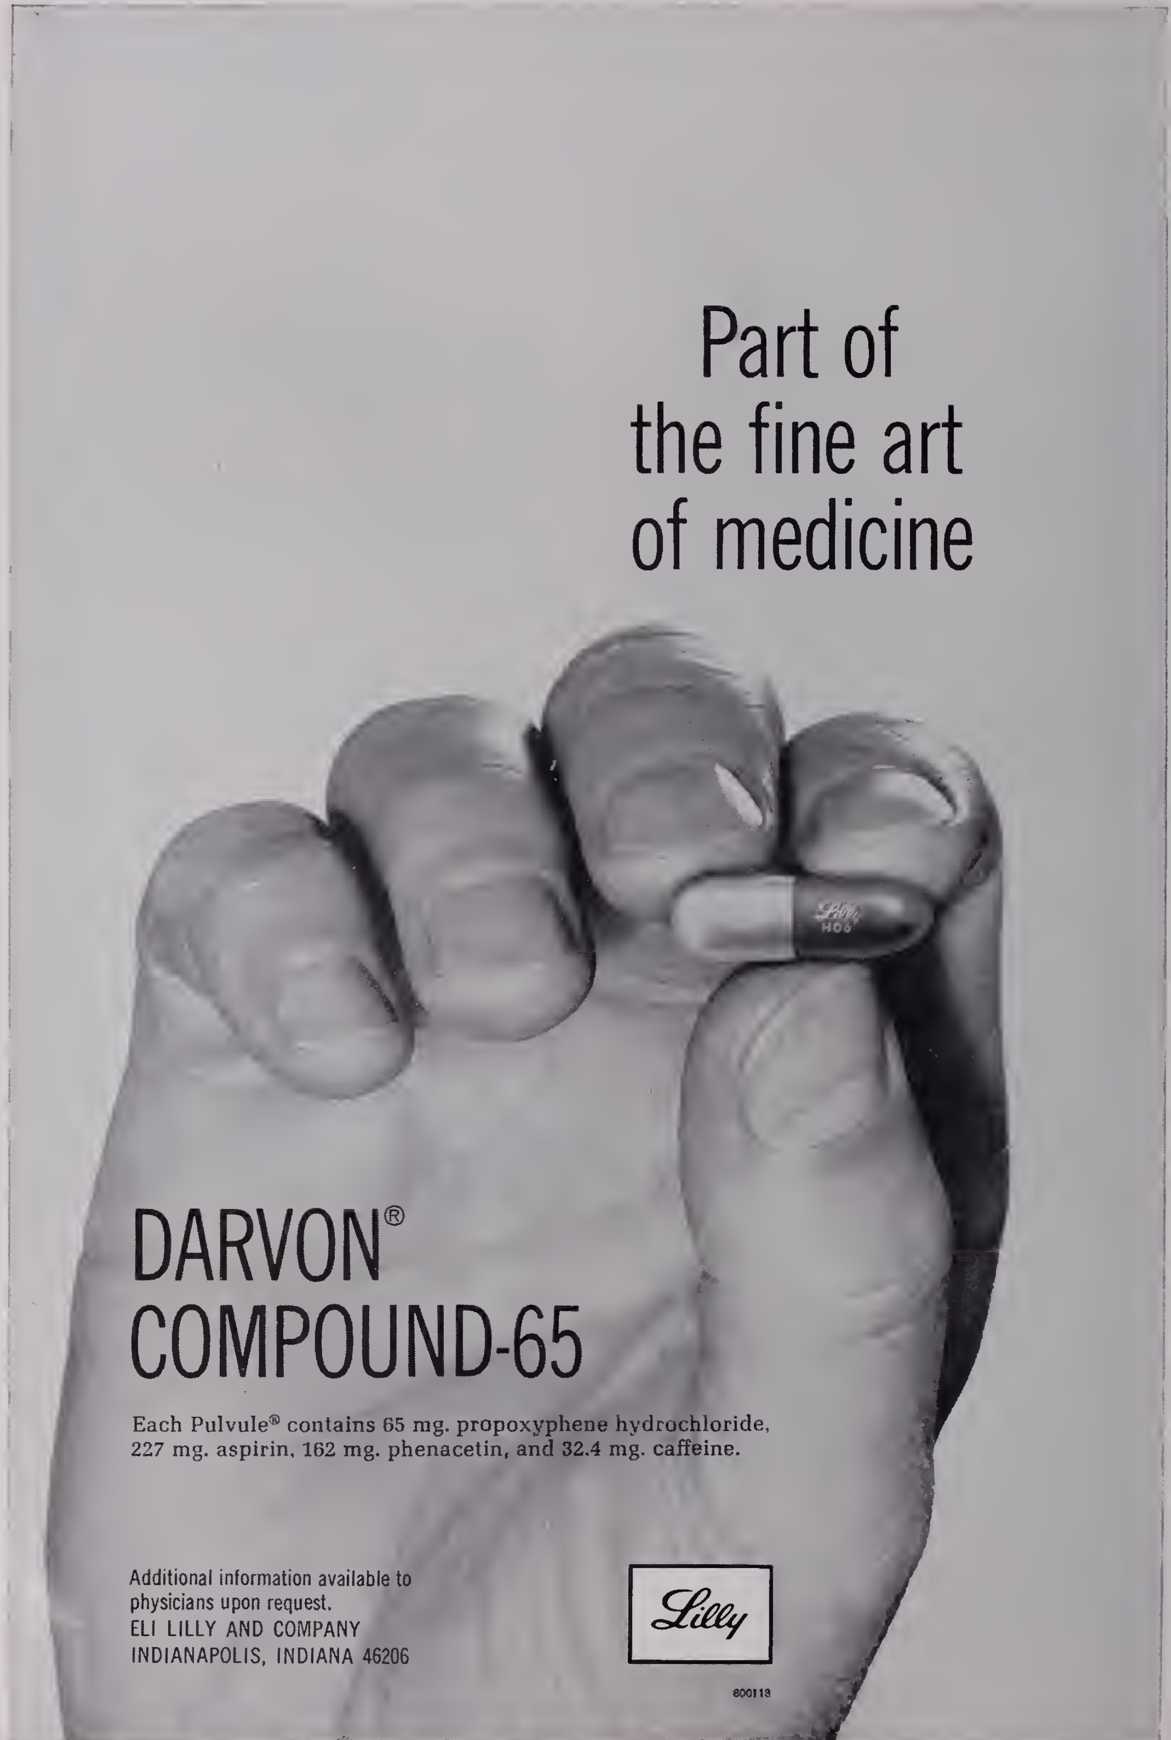
MEN WORK HARD and get ahead, only to have some pimply assistant tell them they have bad breath. The teenage wife makes a cup of coffee and turns her husband into a sex maniac. The older wife washes, irons, mops floors and puts up with birds on the sink, and her husband comes home with a miserable headache and takes it out on her. Girls are always washing their hair. Wives are always washing dishes.

Teen-agers wear sneakers and sandals. Adults wear support hose. Teen-agers rub each other with suntan oil. Adults rub each other with liniment.

ADULTS GET HAY fever and sneeze. Young people are always at the end of a glorious evening. Adults are always at the end of their rope.

Life is fun, fun, fun for the young. They can laugh even with their mouths full of hair. About the only happy time for an adult is when he has an accident and the insurance company pays off. It isn't fair!

Worse, we have a feeling that it's all too true.



DARVON®
COMPOUND-65

Each Pulvule® contains 65 mg. propoxyphene hydrochloride, 227 mg. aspirin, 162 mg. phenacetin, and 32.4 mg. caffeine.

Acute Arterial Occlusion

ABSTRACT — A brief outline of the causes of acute arterial occlusion with particular emphasis given to arterial embolism. A series of cases is analyzed as to immediate results and most importantly, the prognostic significance for life expectancy after an arterial embolic episode.

BY J. A. BARSS, M.D., F.A.C.S.
PORT HURON

Acute arterial occlusion may be considered one of the true surgical emergencies. In most of these cases, the results of treatment depend on the early alleviation of the circulatory obstruction. In general an acute occlusion of an artery is caused by one of three factors: sudden *thrombosis* at an area of atherosclerosis or in a graft, *trauma,* or *embolization.* Other unusual factors, such as intra-arterial catheterization or graft kinking may occasionally produce an occlusion.

Thrombosis is always the terminal event in atherosclerotic occlusion. Usually more than 70% of the arterial lumen has been occluded before thrombosis occurs. In most of these cases symptoms of vascular insufficiency have been present in the affected extremity before the terminal event, or there has been previous arterial grafting in the area. The specific treatment of this type of occlusion requires more discussion than can be included in this presentation and has been covered widely in the literature. Accurate diagnosis is required and replacement by grafting or bypassing the occluded area are the most common methods of handling the situation. Occasionally, endarterectomy may be suitable.

INJURIES TO THE ARTERIES of the extremities have been studied extensively by DeBakey in his analysis of 2,471 cases in WWII[1], and others. The principles of treatment of these injuries are to replace blood loss, remove damaged tissue, and to re-establish arterial circulation by means of direct anastomosis or autogenous vein graft. The use of plastic prostheses is considered hazardous in the presence of possible contamination. Simple ligation of the popliteal artery resulted in 72.5% amputations in DeBakey's series, demonstrating the value of reconstructive surgery. A shotgun wound of the popliteal artery is shown in (Figure Ia), and repair by vein graft (Figure Ib).

To illustrate one of the unusual causes of arterial occlusion, we have had a case in which a dacron aortic bifurcation graft, put in under tension, one year later completely kinked both iliac limbs, requiring excision of the kinked segments and reanastomosis (Figure II). Recently, Fogarty has reported 10 cases of arterial catheterization which caused occlusion by arterial dissection and thrombosis.[2]

The main portion of this presentation will deal with arterial embolization, excluding visceral and intracranial emboli. The first successful embolectomy was performed in 1911 by Labey. Papaverine was introduced in 1934. In that same year, the use of sympathetic block was described by LeRiche and Fontaine.[3] After the later introduction of anticoagulants, the non-operative approach to arterial emboli, especially those affecting the upper extremity, was popularized. Poor results with conservative treatment, however, and the introduction of the balloon catheter by Fogarty have made surgical treatment the most effective approach to this problem. The use of low molecular weight dextran has been reported to be helpful, but is not a substitute for surgical removal of the embolus.

Our series consists of 27 emboli treated in 22 patients. (Table I.) There were 18 males and 9 females with an average age of 70. The source of the embolus in 20 cases was the heart, and in the remaining 7 the embolus came from the aorta. The emboli were located at areas of bifurcation of the arteries, most commonly the femoral.

Many of the patients had significant disease processes at the time of embolization. Severe heart disease was present in 14 patients, and 8 of these were fibrillating. Four were diabetic and 7 other serious conditions were present in the patients in this series. (Table II.)

TABLE IV PROGNOSIS

OF 22 PATIENTS: DEATH WITHIN ONE YEAR AFTER FIRST EMBOLUS	10	(45%)
OF 4 CASES WHO HAD MULTIPLE EMBOLI: DEATH WITHIN ONE YEAR AFTER FIRST EMBOLUS	3	(75%)

The actual surgical removal of the embolus was successfully accomplished with restoration of arterial circulation, in 20 out of the 27 embolic episodes. (74%) Three emboli had been present over 24 hours. Two of them had poor results. (Table III.)

There were 4 patients (15% of emboli) who had amputations and 7 hospital deaths. Of our 22 patients, 10 were dead within the first year after embolectomy. Four patients had multiple episodes. Of these, 3 were dead within a year after the first embolus. (Table IV.)

DISCUSSION

The signs and symptoms of sudden arterial occlusion are well known. They include pain, coldness, and numbness in the extremity, with pallor and mottled cyanosis, usually a definite level of temperature demarcation and a loss of pulses below the level of occlusion. The final end point of viability is loss of motor function of the muscles intrinsic to the ischemic area. The results of therapy are usually dependent on early treatment, for there is always a propagation distally of thrombosis following embolization.

In large collected series of cases, 90-95% of emboli have been found to arise in the heart.[4] Most of the others arise in the aortic aneurysms or severely atherosclerotic aortas. Crane[5] has indicated that one should think of the aorta as a source of emboli in localized ischemia of one or more toes.

IN THE TREATMENT OF arterial embolism, without a doubt the most valuable recent development has been the introduction of the balloon catheter by Fogarty in 1963.[6] There has been a marked increase in successful embolectomies with the use of this catheter. In 25% of patients with embolism, other clots and emboli have been found at a distance from the original embolus.[7] Additional clots and emboli may be present even in the presence of good arterial backflow from the distal vessel. This instrument has also made it possible to remove emboli from major vessels, chiefly the iliac and the aorta, through easily accessible arteries such as the femorals. This may be done with little additional risk and often under local anesthesia. The mortality rate is high in these patients because of the many serious associated diseases, and this simple method often can be employed safely in this poor risk group.

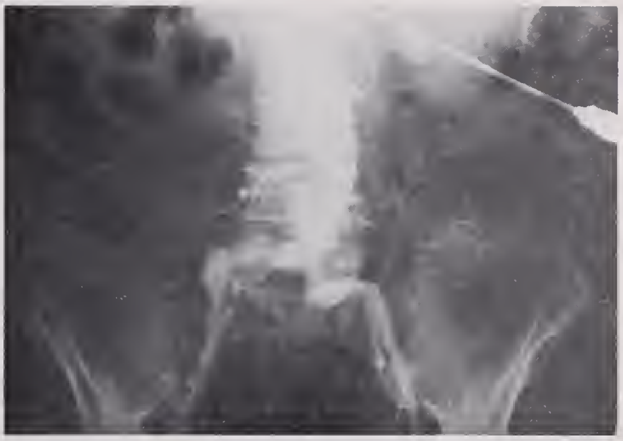

FIGURE II(a): Aortogram before aortic resection for aneurysm.

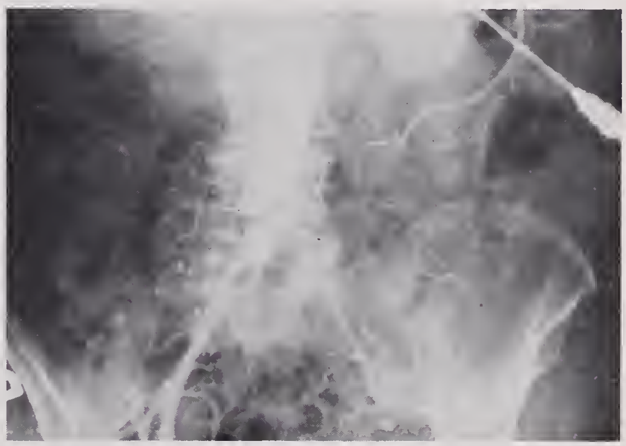

FIGURE II(b): Aortogram one year after aortic resection. Severe kink in right iliac limb of dacron prothesis is demonstrated. Left limb was completely occluded by a similar kink.

Lumbar sympathectomy has been used by us and others after unsuccessful or incomplete embolectomies in attempt to avoid or lower the level of amputation. Its main benefits lie in an improvement in viability of the skin and in some alleviation of rest pain. Most investigators agree that sympathectomy has little effect on claudication.

Anticoagulants should always be used in an attempt to prevent distal propagating thrombosis if there is to be any significant delay in the surgical treatment of acute arterial occlusion. Heparin is the drug of choice and it also used at the time of surgery because of its immediate action. We have not considered its use helpful after restoration of circulation to an extremity which had adequate outflow vessels.

MUCH WORK HAS BEEN done recently on the use of low molecular weight dextran in the treatment of vascular disease and ischemia. We have not had the opportunity to run any significant studies on the use of this material because its availability has been limited until the present year to investigation by a limited number of hospitals. Dextran of a molecular weight of about 40,000 is said to prevent thrombosis in the following ways:

(a.) It increases hemodilution and reduces viscosity.

(b.) It coats the red cells and prevents the adherence of agglutinating protein substances.

(c.) It increases the negative charge of the red blood cells and causes them to repel each other.

It has been found to be safer than anticoagulants because no defect in the clotting mechanism is produced and there is no alternative of bleeding time. Its only real danger lies in the potential overloading of the circulation.

CONCLUSIONS

We agree with the contention that surgical intervention is more effective than conservative therapy in acute arterial occlusion. Other investigators have found that even in viable limbs, after brachial artery occlusion treated only with supportive medical care, 25% have disability due to ischemia and causalgia.

Mortality rates in the treatment of acute occlusion have been quoted at from 20-40%[7] with death usually due to heart disease. Our own mortality rate was 26% with 45% of patients dead within a year following their first embolic episode. In those with multiple emboli, 75% were dead within a year after their first embolus.

The Fogarty catheter has been an indispensible addition to the surgical treatment of arterial embolism and thrombosis. Other new developments, such as low molecular weight dextran, may help to lower mortality and morbidity.

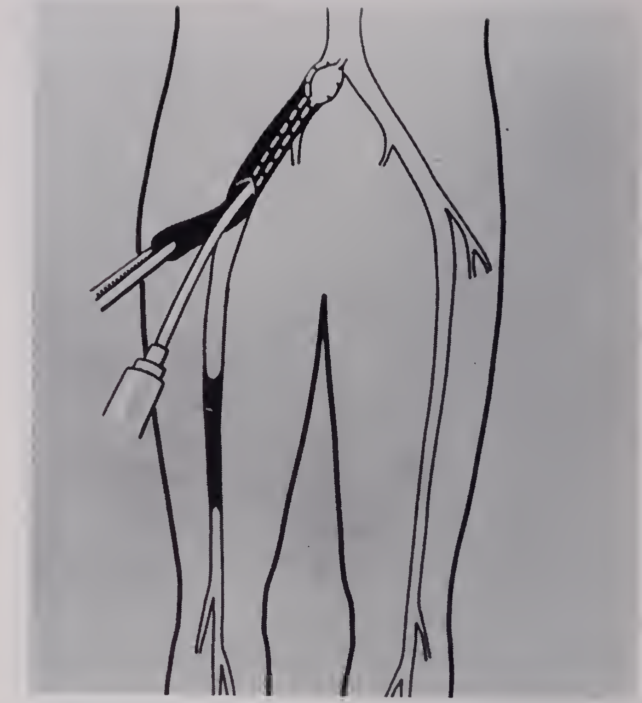

FIGURE III: Diagram illustrating the use of embolectomy catheter for extracting proximal and distal emboli through easily accessible arteries.

SUMMARY

A review of 27 emboli treated in 22 patients has been presented, along with a review of the causes and treatment of acute arterial occlusion.

Most of these patients have severe heart disease and/or other significant disabilities at the time of their occlusion, resulting in a high mortality rate.

Almost half of our patients with arterial embolism were dead within one year after their first episode.

Surgical treatment, with the use of the balloon catheter and other adjunctive measures, is to be preferred rather than conservative management in acute arterial occlusion.

Editorial Comment:

This article acutely points out the value of surgical intervention in acute arterial occlusion as a limb or life saving procedure, and the obvious value of the Fogarty catheter. It is also obvious the question of sympathectomy has not yet been laid to rest.

One notes that in this group (average age 70 years) of 22 patients with 27 emboli, that a 45% mortality occured within one year. It is also noted that 14 cases had severe heart disease and 8 of these were fibrillating. One wonders whether long-term anticoagulation was used and whether it would have altered the picture.

The Child's Call for Help

ABSTRACT — Clinical examples are utilized to demonstrate how the child calls for help in non-verbal behavioral ways, and further, in ways that are counter to what is acceptable in a given community. The examples have one important aspect in common in that they each tended to force intervention by some outside agency. The need for a community to be alert to such calls and respond promptly, thereby hopefully helping the child avoid the need for "louder" and more forceful and often more dangerous communications, cannot be emphasized too strongly.

BY RAYMOND W. WAGGONER, JR., M.D.
MARSHALL SHEARER, M.D.
BOTH OF ANN ARBOR

A suicide act in an adult is seen as a composite of the impulses to die, to be rescued, to "hurt" another person usually a "loved one," and a call for help. If the likelihood of death resulting from the act is small, it is usually referred to as a suicide gesture, with the "wish for help" impulse being predominant. These adults use this non-verbal means of obtaining help even though they frequently know how to obtain help otherwise.

What is a child to do who lacks such knowledge and sophistication, who finds himself in an intolerable situation with himself and his parents?

How does he call for help?

In our experience it is only at age 14 to 15 that a child can verbally ask his parents, teacher or other adult to secure help for him. Prior to that age he may not have the awareness that any outside agency or person could midify his and his parents interaction, or he is too scared to articulate the problem or cannot do so — perhaps even to himself.

Children must "call for help" in non-verbal behavioral ways. This may take a variety of forms.

IT IS THE THESIS of this paper that the child calls for help in non-verbal behavioral ways and this behavior is most apt to take the form of a community "delinquent" act. At least this is where we have seen it most clearly and most often.

We are not suggesting that all delinquent acts are such calls although they may be, nor are we suggesting that when the call for help is present that there is not also the comprised impulses to direct anger both to the self and to a "loved one." Although this complex is sometimes present and can be seen in some of our case material, we wish in this paper to direct ourselves to the aspect that tends to force interventions by some outside agency. We wish to emphasize the need for the appropriate helping professions to be alert for a behavioral call for help and respond promptly, thereby hopefully precluding the need for the child to attempt "louder" and more forceful and often more dangerous communications.

The cases we see are those in which neither the family nor the school have heard the call and responded appropriately, but have tended to ignore the problem or deal with it by suppression of the overt behavior.

Unfortunately, the child does not know what his community considers a psychiatric emergency (if, in fact, he has any concept of what a psychiatrist is). There is some evidence to indicate that the older child's concept of what constitutes a psychiatric emergency influences his choice of behavior. For example one 12-year-old boy wrote numerous suicide notes and acted depressed. He talked of committing suicide by drowning and once while at the lake said to his parents, "I'm going to walk right out into the lake until it's over my head and keep walking." He did so and was rescued by the lifeguard who pulled him into a rowboat. It was only after he had subsequently announced that he was going to walk in front of a car and did so that his parents sought psychiatric help.

DELINQUENCY IS THE most frequent method chosen by children to gain outside intervention. The single most frequent delinquent act is to steal in a manner to insure apprehension. Stealing is often easy for the child to rationalize. There is relatively little risk of self-injury and other motives can frequently be achieved. One 12-year old boy stole a $200 necklace while baby-sitting and gave it to his girlfriend to "wear to school" where he knew it would be spotted. Auto theft is also common:

A. IS A 16-YEAR-OLD BOY who had been in several foster homes until he was adopted at the age of 9. He came to the attention of the juvenile court after he had stolen a car, driven it around with a friend and then pushed it in the river. When A. was interviewed he appeared as a tall, thin, nice-looking boy who looked considerably younger than his 16 years. He had a drawn, tense, depressed appearance and his eyes looked as though he might be about to cry. He was quite anxious throughout the interview.

When asked what had happened, he started by saying he could no longer live at his home, that he had to get out because he could not get along with his father. He then said he and a friend had seen a car with the keys in it, gone for a joy ride, parked it that evening and left it. He said he felt certain the police would find it but they did not. He and his friend went back the next day and after driving around some more, and since they had not been caught yet, they felt they ought to push the car in the river. Apparently, someone had seen and recognized A., and had reported it to the police so he was later apprehended.

A. said he did not know why he had taken the car, but when asked about home he again said he had to get out. When asked what might happen if he was returned home, he said "Oh, I might try to rob a gas station or something like that." This was said with a considerable amount of anxiety and was taken as a sincere statement.

The evaluation of the family revealed that the boy's mother had some 15 years ago lost a baby at 3 weeks of age which was to be her only pregnancy. She apparently suffered a severe depression at that time and has clearly never worked through her grief. As she talked about the loss, she became extremely agitated and depressed and her facial expressions denoted intense rage. What became apparent was that she was in effect, attempting to replace her loss with the adoption of A. and attempting to psychologically force him into an infant's role. The situation had become intolerable for A. who in a joint interview with his parents seemed unconsciously and ambivalently trying to be the infant his mother was wanting him to be. In this interview the mother clearly demonstrated that she was totally unable to "hear" A. or respond to his emotional needs.

At the time of the theft, it is unlikely that A. consciously was aware of why he stole the car or for that matter pushed it in the river. Following his apprehension, detention in the Juvenile Detention Home and psychiatric evaluation, however, he was to some degree aware of the implications of his actions. This seemed clear by his statement about robbing a gas station if he were returned home. Interestingly, on a previous occasion some months before, he had written his name on a water tower in a nearby city "because I wanted to see my name writ like that."

There appears to be a strong element of guilt operative in this boy associated with not living up to his mother's expectations. He clearly has attempted to be his mother's grieved, lost "baby" without success. He has repeatedly gotten the message from his parents that in his mother's words, "We hoped he would develop meaningful object relationships but we were wrong." He was at once terribly angry yet needful of his parents. This particular act got him out of the home by being caught for doing "something bad."

In many respects, A., is similar to the adult who feels guilty and seeks punishment by doing something else for which he will be punished, and this is frequently compromized with the hostile wishes toward an ambivalent object, just as occurs in suicide acts.

The following two cases demonstrate this further.

A 7-YEAR-OLD CAUCASIAN boy was referred to Children's Psychiatric Hospital by a child guidance clinic, secondary to referral to them by the police. The chief complaints were lying, stealing, fights, fire-setting, enuresis, belligerance, yelling at mother (I hate you) and calling her a tramp and a slut like his father did. The incident which precipitated the referral was his pulling a knife on the babysitter. (Three years prior to the incident the mother had a "nervous breakdown" and picked up knives and threatened to kill people.) The mother stated he had a bravado, belligerant attitude and repeatedly said, "I don't have to listen to you. I hate you." She reported that she was at her wits end to know how to control him. She had tried to manage him by talking to him and had whipped him with a belt, sometimes on his bare bottom.

He was quite close to his maternal grandmother prior to her developing leukemia and dying in 1966. The parents date the onset of his difficulties to about six months prior to her death which coincides with her lethargy and the diagnosis of leukemia being made.

The mother, age 29, was three months pregnant with the patient prior to her marriage. In 1964 she had a "nervous breakdown" resulting in a series of ECT. Subsequently, she has had three addtional psychiatric hospitalizations for "going to pieces." One of these was secondary to an overdose of sleeping pills. In terms of modesty, the mother stated she does not go out of her way not to be naked in front of the children and that when she does walk into a room naked she tries to convey a nonchalant attitude so the children will not think there is anything to be ashamed of.

The father, a 31-year-old electrician, was married previously. His first wife committed suicide with an overdose of sleeping pills in June prior to his marriage to his current wife in November of the same year. He also attempted suicide with sleeping pills shortly after his first wife's death. He noted their son did not play with fire or soil his pants when around him. Except for enuresis and encopresis the boy is just like his father was as a child, according to his father. The father also would go around the house naked, including standing in front of the picture window, which his wife objected to. He replied that passersby do not have to look if they do not want to. This decreased after the police talked to him about it. At the child guidance clinic, the parents got into a real argument as to whether she had filed for divorce six or seven times. Each parent would "steal" from the other and from the children's banks. The wife took the hinges off his gun cabinet to take 27 silver dollars to pay her Bingo gambling debts. Both also tacitly acknowledged they stole from outside the home also. On occasion the mother would tell the children the father stole the plywood in order to make some favorite toy. Each accused the other of infidelity in front of the children without the other denying it. The patient picked up the mother's accusation of the father sleeping with the "girl next door." He also imitated his father who called his wife a tramp and slut after she was "raped" when she was picked up by a man while walking along a highway. After the rape she coaxed the man to take her to a drug store — where she called the police.

There are two other children, 2 and 4½ years younger.

A school report indicated that the stealing was chiefly a means of getting attention, that his teacher was completely rejecting him. The trait that got to her most was "that silly smile he wears all the time, especially when confronted with his stealing." He was at grade level, doing "C" work. He has a normal attention span and does good seat work.

Psychological testing revealed a guarded, rather than constricted boy who could modulate this tendency in the service of attaining his goals. He lacked flexibility under stress. "It was not possible to state precisely the source of this lack of depth in adaptive skill. One might suspect a very limited experience basis, a deprivation along these lines in the home situation." "In content the tests suggested an incomplete resolution of the first phase of the oedipal complex in rising sexual curiosity. What was suggested was no regression but slowed psychosexual development. He had many concerns about his body and that of others, but this was more curiosity than fear of injury. He pictured home life as disorganized. He was aware of parental struggles, felt helpless, sided with mother but saw her as helpless. She was seen as potentially giving but not doing so. There was a considerable defense structure against the aggression of father."

He responded very positively to a description of the type of hospital CPH was and was eager to explore the hospital.

It appeared that, indeed, he got a great deal of nurturance from his grandmother prior to her illness and that a good deal of his behavior constituted an imitation of his parents, as he was caught in a real conflict between his warring parents. This state was chronic. The call for help was his pulling a knife on the babysitter.

M. IS A 13-YEAR-OLD, handsome, slightly overweight boy of superior intelligence who was referred to CPH by a psychiatrist because of refusal to go to school and repeated physical attacks on his mother during which he had inflicted painful bruises, and due to his apparent lack of control and evident rage, had quite frightened his mother. This had gone on for about two months prior to referral to CPH.

His 17-year-old brother had to intervene on more than one occasion to prevent serious physical injury to his mother. The boy's parents are divorced and at the time he was seen — the boy was temporarily living with his father because of the family's concern of injury to the mother.

M. had done well in school and had shown no overt evidence of conflict until approximately one year prior to referral. At that time he began refusing to go to school because of "stomach aches." (Interestingly, the mother had a 15-year history of colitis with frequent complaints of abdominal cramps.) He would then stay home on some occasions or on others return from school after calling his mother to pick him up.

This developed to the point where he entirely refused to go to school. Pressure from the school resulted in a number of examinations by physicians over the year, including four psychiatrists. Attempts to physically force him to school resulted on one occasion in the father being kicked by M. in the testicles which promptly halted these efforts. After that he would sit at home watching T.V., help his mother with housework, prepare dinner and help with washing the dishes after dinner.

Frequently he would go to his mother's bedroom after she had gone to bed either to have his back rubbed or to rub his mother's back. He noted his mother was a very neat housekeeper except that "her room is always a mess." He had often slept in his mother's bed since his parent's separation and subsequent divorce (this had occurred some five years prior to the evaluation). It finally developed that if his mother would attempt to keep him out of the bedroom on the recommendation of the physicians she had seen, he would become violently angry, kick at the door, try to force his way in and it was usually at these times that the attacks on his mother would occur. The mother noted that she had been told he was suffering from an "Oedipal complex and I should completely reject him."

The parents had had marital conflict for a number of years and were divorced as was mentioned above, five years prior to referral to our clinic. M. had lived with his mother since the divorce and was visited two to three times a week by his father. The mother was seen as a very angry, depreciating woman who showed a high level of anxiety and what appeared to be a chronic depressive state. She had marked dependency needs which she was unable to get fulfilled. After her husband left, she allowed M. in essence, to take his father's place, often allowing and encouraging him to sleep with her at night. Neither M. nor his mother were able to handle his impulses as he moved into puberty.

At the time of evaluation, it became clear that the situation existing between the mother and M. was of crisis proportion and that immediate intervention in the form of removal of M. from the mother's home was essential to prevent serious injury to the mother.

The question of conscious versus unconscious motivation in these patients should be mentioned. Usually there seems to be some conscious awareness or at least a preconscious awareness of what the symptom is accomplishing by the time of psychiatric referral.

The following is a case history of a "second" call for help when the first resulted in treatment which did not meet the child's needs or expectations. The unusual feature here was the child's awareness of available help and what the child guidance clinic would consider as emergent for the second call. This was apparently due to her knowledge of her father's duties in religious work. It is felt her "second call" was conscious and deliberate.

W. IS AN 11-YEAR-OLD white female, referred to CPH from a child guidance clinic with the chief complaint of delusions. She had been refer-

WAGGONER

red to CPH from a child guidance clinic with the viously by her mother with the chief complaint of, "she has no friends."

Both parents are middle age and college graduates. The father is employed full time in religious work (not a minister). Many evenings and weekends he is not available to his family. He gets "kicks" out of outmaneuvering other drivers in traffic and running red lights. He does not follow many teachings of his church in daily living, although he professed to do so. He intellectualizes frequently. The mother described her own childhood as one of conflict with her own mother — "Mother never said what she really meant." The patient and her mother occupied the same position in their respective sibship.

The patient's early developmental history was unremarkable except for difficulty in toilet training and stubborness.

At the child guidance clinic, beneath the veneer of a mother seeking help for her friendless daughter, was a hostile mother who spoke of the patient through clenched teeth. The patient had a mind of her own, would not obey (i.e. coming home from school a half hour late, refusing to help around the house, not taking piano lessons). The mother complained that the patient sang off key, "She is obese and our doctor doesn't like fat kids. She has no poise or social grace. She walks and looks like her father." (Mother was a Girl Scout leader and said the patient had no friends among the Scouts.) Compared with her talented, gracious, achieving sisters, she was second best although an A-B student. Her dress and general appearance was more appropriate for an 8-year-old than a girl of 11.

She was wearing her Sunday clothes on a Friday (which the parents said was "intolerable"), was poorly groomed especially in church, had taken to making facial grimaces in church, and picking her nose and eating it at home and in church. Lastly, she had begun to talk of death, dying and running away.

On investigation, she did have friends. Most of them were boys and her play was tomboyish.

At the child guidance clinic things got worse after a brief time. Her drawing shifted to only heads of women and boys with skirts. She began exposing her panties in the office and at length talking about a snake in the filing cabinet that was going to bite her, and saying she could talk to God. She said God told her his real birthday was December 13, and he was coming in the year 200—a fact she was to publicize. The child guidance clinic became quite alarmed and referred her to CPH for inpatient treatment.

At the time of referral she was seen to be depressed. She also had an extensive fantasy life with some question of her control of it. Her two fantasy themes were being a deserted waif and rescued by a prince charming and of people being secret agents to spy and find out what others thought of her and report to her. By the end of the interview she was relating quite well.

The mother was relieved at the recommendation of inpatient hospitalization.

On admission, she carried a small jewelry box with a small piece of yarn protruding. It was her "transistor" which allowed her to talk with the "Jolly Green Giant" and with "God." She was about to leave this in the doctor's office when her mother reminded her of it.

The first progress note was written after one and a half weeks. "The patient impresses me as anything but a psychotic youngster and I am hard put to believe she is actually hallucinating or delusional, even in the past. Rather, I feel that she has used her pseudo-delusions as manipulative devices to restructure and influence her environment and this to a great success. She indicates that she was eager to terminate her relationship at the child guidance clinic because the hope for changes in the relationship with her parents was not forthcoming. At this point, even knowing or sensing her therapist's sensitivity to this particular kind of behavior or production, she (best as I can tell) feigned hallucinatory and delusional experiences in order to sever the relationship. She was successful in doing this. In spite of her verbal protests and playing the role of not liking it here at CPH, it is rather obvious she is enjoying her involvement in her activities with me." She does grimace at time and her attitude toward feminine staff varied from normal to one of stubborn rebellion or infantile clinging.

Later the basic dynamics emerged. The mother was quite ambivalent toward the patient's emerging sexuality. On one hand, mother was fearful her daughter would be too attractive to boys and act out sexually, hence the clothes inappropriate for her age and general parental attitudes and restrictions commensurate with that younger age.

On the other hand, in subtle, undoubtedly unconscious ways, she was encouraging her daughter to act older than her age. The parents had a poor sexual relationship and the mother was seen as having a "super ego lacunae" in the sexual area with the fear of her daughter's sexual involvement yet vicariously enjoying the thought of it.

THE CASES THAT we have seen have a long history of chronic conflict between the child and usually one parent with the other parent either being psychologically not involved or supportive of the conflict in indirect ways. The child may, in fact, be acting out the parent's unconscious needs. At the time of a clear "call for help" this chronic conflict usually has taken the turn for the worse, which though not necessarily too marked, is obviously significant if recognized. There is, of course, the new symptom or behavior which constitutes the call for help also.

Often when the child is interviewed alone he has more insight than his parents and is greatly relieved at the intervention and especially at the prospect of treatment.

The denial one sees in parents in these situations is usually considerable and must be dealt with actively and directly. Sometimes the goal in regard to the parents, that must be settled for is helping the child understand his responsibility and part in what is happening and to guide him to make the best possible adjustment to a difficult home situation.

In this paper we are not suggesting that all deviant behavior is an unconscious call for help. What we are proposing is that there is a group of cases in which the symptomotology is based on the child's unconscious or almost conscious desire for help.

We also feel there are implications for treatment, establishing a meaningful rapport with the family at the time of the first contact, but most important is heeding the call the first time, wherever the call arises so that the child is not pushed to even greater and more dangerous measures to attract and sometimes force outside intervention and assistance.

Survival Patterns for Small Hospitals —Dilemmas and Prospects

BY ANDREW PATTULLO, M.B.A.
BATTLE CREEK

This opportunity to discuss the future of smaller hospitals is very gratifying. One reason has to do with the Kellogg Foundation and its earlier history. For its first 10-15 years of existence (1930-1945), the Foundation was primarily known in the hospital field for its activities with smaller hospitals in Michigan. In the "Michigan Community Health Project," the Foundation worked extensively in seven predominately rural counties of Southwestern Michigan and dealing with all aspects of health—preventive and curative.

It soon became obvious that hospitals were essential to this total program, but the resources at that time were rather minimal. For example, several hospitals were situated in converted "mansions." As Graham Davis, the Foundation's first hospital staff person used to say, the hospitals were "pretty sorry." Hence, the Foundation endeavored to help in many ways, ranging from support for completely new, "model" hospitals, to broad educational programs. As a matter of fact, one of the first non-metropolitan hospital councils in the country emerged from that program, the Southwest Michigan Hospital Council, noted for progressiveness and its sponsorship of the Professional Activities Study.

At that time (circa 1940) a considerable controversy raged in this country concerning the role of small hospitals. (And times haven't changed too much.) The question primarily hinged on "to be or not to be." A number of knowledgeable people maintained that is was much better to concentrate hospitals in fairly large communities, and not to build facilities in rural areas. The Foundation's position was substantially to the opposite pole, that in fact hospitals were essential to the attraction of physicians.

Several of the model hospitals the Foundation helped to construct were in collaboration with the Public Works Administration, a federal program designed to combat the depression. In 1940, the magazine *Hospitals* carried a lead article attacking the government and the Foundation for the development of such hospitals, maintaining they were a disservice to the American people.

SOME YEARS LATER in the mid-40's there still existed a real gap between many smaller hospitals as contrasted to sister institutions in larger cities. At that point, the Foundation extended a program in diagnostic services improvement initiated in Southwestern Michigan to the balance of the state, including the Upper Peninsula, where in 1946 there was not a single pathologist and only one radiologist to serve this large region.

I shall never forget one experience in a prosperous county-seat hospital when the board President was showing me around. With some pride he opened a door saying, "This is our X-ray Department." It opened into a closet containing a portable X-ray machine. Incidentally, today this is now a fully accredited hospital of some 150 beds, beautifully staffed and equipped. The original rationale of Hill-Burton was to bring improved hospital care to rural America. It is now generally acknowledged that the Act really went too far, since undoubtedly in some states too many hospitals were built in locations where they probably shouldn't have been. And yet, readily admitting these deficiencies, Hill-Burton put the small hospital "in the sun."

Because of a massive and unique federal program, the existence of the small hospital in this country is no longer a theoretical matter. There are literally thousands. But even so, the role of the small hospital is still very much a matter of concern.

Small Hospitals Have Major Problems

Using such criteria as Productivity, Costs, and Quality, small hospitals have major problems, probably more so than in much larger institutions. For example, there is still a significant gap in terms of meeting accreditation standards of the Joint Commission. There is a definite correlation between size and accreditation — the smaller the institution the less likelihood of accreditation.

The small hospital has often been the target of charges that it is basically an uneconomical and inefficient operation. This thesis probably stands up better in the case of small hospitals in urban

---

Mr. Pattullo is Director, Division of Hospitals, W. K. Kellogg Foundation, Battle Creek. The article is printed with the permission of the Michigan Hospital Association, which printed it originally in its journal.

areas, where the desirable minimum size is generally looked upon as being 200 beds. In cities, the small institution is difficult to defend on the basis of plant and service duplication. But in many instances the small hospital is a single institution serving a community and surrounding area. Two hundred beds may or may not be desirable, but in most cases it is somewhat theoretical.

STILL ANOTHER CONSEQUENTIAL problem confronting small hospitals is manpower. As noted, most such hospitals are in non-metropolitan areas, and of course are not teaching institutions. Hence the attracting of skilled personnel is usually troublesome.

In 1967, as in previous years, the smaller hospital is under attack. The title of this presentation "Survival Patterns" is good proof of this. There have been dramatic changes in the small hospital over the past two decades. But there are still basic weaknesses inherent in the small hospital which must be resolved. "Survival Patterns" is a provocative way of putting it. Any examination of recent events reveals a deep concern about the community hospital.

One evidence of this is found in the DeBakey report, in turn followed by the Heart, Stroke, and Cancer legislation. The thrust of this report and Act has to do basically with the "performance gap" between the excellence in the great teaching medical centers (as exemplified by the *Ladies Home Journal's* "ten best") and something less presumably found in most other institutions. Although there may be some skepticism in terms of the actual implementation of Heart, Cancer, and Stroke, as resulting in the "haves" getting even more, the objectives are quite different—the "have nots" are supposed to benefit too.

Another compelling indication is found in hospital areawide planning, and now also in comprehensive health care legislation. Although areawide planning may have had its genesis in terms of self-protection on the part of major groups and corporate givers in such major population centers as New York, Chicago, and Detroit, its implications soon out ran this orientation. At this point no one can prophesize the total impact of comprehensive planning, but it is bound to influence the small hospital. How could it do other, since the hospital is the keystone of community health services, and the small hospital is at least numerically far in the majority?

STILL ANOTHER POWERFUL factor in the situation is the physician, at least in terms of the quality gap. Twenty-five years ago we were talking about the necessity of the hospital in smaller communities as essential to the attracting of doctors. Today the doctor who has been attracted is more and more insistent that to the greatest extent possible he not be isolated, that he have available services reasonably compared to the medical center where he was trained. This is why he wants an intensive care unit, and today, even in a 40-bed hospital, talks about a coronary care service and an image amplifier in X-ray. Sometimes these demands may not appear to be too practical, but they are symptomatic of a very real desire of the physician to be provided with what he believes to be essentials.

A generation ago the small hospital medical staff was much more apt to be satisfied with what was available. For example, the absence of even minimal diagnostic X-ray and laboratory tools was accepted, perhaps with resignation, as a fact of life in rural practice. Today's young doctor is not going to accept it.

Still another dimension is administration, admittedly an aspect of some sensitivity and delicacy. A generation ago the typical small hospital administrator was a nurse, who was usually moved up from a clinical supervisory position. Most of these nurse-administrators were sincere, hard-working, and "dedicated," as overworked as this cliche may be. A number were also efficient, able, and "hardheaded" business-wise.

In the mid-1940's hospital administration was becoming recognized as a profession; and several university graduate programs were being established. Inevitably this has had an influence upon the small hospital. Today the nurse-administrator is almost a rarity; the male is predominant. The typical board of trustees recognizes the hospital as a complex undertaking and now looks for a "business" type of executive. And more often the new breed is likely to be a young university course product, who usually views the small hospital as a first rung up the ladder.

This administrator is something like the young M.D.—he, too, wants an institution of excellence. Through regional and state hospital meetings and the other ways he keeps in touch with developments—he is not as isolated as his predecessor of 1930-1940. Selfishly, in terms of his own career, he must be associated with a hospital that is accredited. He is looking for better solutions to the problems of the small hospital. And my observation is that although he originally looked upon his job and hospital as a stepping-stone, he finds so much satisfaction he is tending to remain and grow with the hospital.

WITH ALL THESE factors—such as Hill-Burton, areawide and comprehensive health planning, medical staff, and administration—the small hospital of today is much different. But we are on the threshhold of still further changes that will be even more consequential in the coming decade.

To accomplish these, some degree of "autonomy" of the individual hospital will be lost, but I believe the new era will be one of real excitement and challenge. It will require a degree of cooperation not yet realized in the hospital field, but it will result in a very much improved level of service to the people.

"Compact" Agreements. Only within the past 20 years have state hospital associations come into their own. Within that span most states have retained full-time executives, and many have mounted imaginative and extensive programs. In the next decade we shall see similar developments on a regional level but with a somewhat different orientation. Present hospital "councils," often a pleasant luncheon club, will retain full-time executives and staffs. The program emphasis will be concerned with the development of what I will term "compacts," to which member hospitals may or may not subscribe. The trust of such compacts may be described simply as providing on a cooperative basis such services as an individual hospital would find it very difficult to undertake alone. Following are examples:

Computer Applications. The hospital world is on the threshhold of significant breakthroughs in terms of computer applications. At this point they are still very much developmental, but the potential is there. As I grasp it, if any two factors about computers are accepted they relate to (1) size of capability in terms of output, and (2) to the fact even the simpler applications are extremely expensive to implement. There is every reason to believe it would be very much to the individual hospital's advantage to join forces for computer application. By so doing it would be possible for the single hospital to have access to hardware of a capability impossible to acquire by itself. In terms of programming expense, this would also be shared with many others. This would necessitate agreements as to participation, and to sharing capital and/or operating costs.

It does not make sense for all but perhaps a very few large and unique hospitals, mainly university connected, to install individual computers. Unfortunately there is very apt to be a large amount of money expended by individual hospitals for computer installations, probably largely wasted, that could much better be pooled for better results.

Thus the small hospital probably cannot by itself think of an individual computer, but it definitely can in cooperation with others. The potential of the computer is literally breathtaking, and will do much to bring all hospitals—from medical center to the smallest unit—together. Further, the eventual application will likely be extended from the hospital to the individual physician's office to provide an even greater degree of integration.

It is, however, not now premature for the small hospital, *in cooperation with others,* to take initial steps in the formation of "compacts" for computer development. It would be well to seek expert advice; in the Tri-State area the University of Michigan is an excellent resource with some experience already gained in the hospital field.

"Management" Engineering. I do not know of any research that has conclusively demonstrated smaller hospitals to be more inefficient or costly than larger institutions, except possibly those small hospitals located in large, urban areas. I do not believe this to be the real issue. But large or small, hospitals are under continuing and harassing attack in terms of productivity and costs. It stands to some reason that smaller hospitals do have greater problems in regard to these questions because of their comparatively limited resources in terms of plant investment and operating capital.

I believe that all hospitals must become more concerned with these questions. But perhaps small hospitals have a more difficult problem in coming to grips with them than do larger institutions. But there are ways and means for any hospital to adopt something other than a passive attitude. For example, "HAS" and "CAP" are ongoing national programs very much concerned with productivity and costs, and which came into being mainly for the benefit of smaller hospitals in this country. Their cost is reasonable; there is no excuse for any hospital not participating. In another area the same case stands for "PAS" and "MAP" related to patient care studies and practices.

In my ken we are also on the threshhold of some kind of similar breakthrough in regard to so-called "management engineering," or the application of industrial engineering to the hospital environment. Some regional councils have already taken steps to bring the benefits of industrial engineering to the individual institution. Results have varied, but in at least one area, Southern California through the CASH program, results have been substantial. CASH was not conceived as a crash effort, but represents a combined practical research, service, and educational venture. Its 140 plus member hospitals, most relatively small, contribute on a prorated basis, and receive value considerably greater in terms of cost reductions, greater efficiency, and yes, improved standards. Another very successful cooperative program is being conducted in Maryland.

Here is another example of the relative impossibility of an individual small hospital being able by itself to obtain the skills of industrial or management engineering. But cooperatively it is possible, as CASH is so well demonstrating. Again, improving productivity and stabilizing costs are two of the major problems in hospitals today. Management engineering is a technique that is available and does have validity in the hospital setting—including direct patient care. Where through a joint approach its benefits can be brought to the smallest hospital, the field is vulnerable to justified criticism if it does not act.

Education and Manpower. The small hospital, through the regional council or the health planning group, must take more postive steps to help itself in resolving manpower problems. And through the exploding community college movement, now at the rate of one new college weekly, there is considerable promise. The community college is very much interested in meeting the technical personnel needs of the area it serves. Although the college may consider its obligations primarily on a local community level, there is no reason why the scope cannot be expanded to a regional basis.

Councils should evaluate their manpower needs on a continuous basis; how many nurses, aides, X-ray and lab technicians, et al, are presently needed and will be in the future? Within an area of 10 counties perhaps only one program in some fields should be offered to meet the needs; in others perhaps two or three could be justified as based on likely demand. I believe those colleges within the region would be very willing to participate in such an approach.

The possibility of multiple area financing should be considered. In interstate regional education compacts, such as SREB, there is a sharing of the cost of certain very expensive professional programs. In terms of intrastate regions perhaps the same principle could be developed, with districts contributing. For example, a compact to finance an expensive A.D. nursing program might be spread among several educational districts, within a given hospital council region.

Television. There is currently a very limited number of experimental TV programs, mainly educational, linking several hospitals. Although the present cost is such to be almost prohibitive except as demonstrations underwritten by outside financing, at some point it will be feasible. In education, airborne television has been in use for several years. TV undoubtedly has great potential for hospitals as well.

In West-central Michigan a group of hospitals, spearheaded by smaller institutions, has been exploring TV linkage for some time. The medical staffs are keenly interested, as a means of communication with medical centers. Other benefits in addition to educational values have been documented by this group. A regional TV compact arrangement is being proposed, beginning with a limited number of participants.

Similar to computer networks, TV arrangements will be regional in nature at first, and then linked to other networks in a state, and possibly interstate as well. Although again education is a principal objective, other uses, e.g. direct patient service, will be possible.

Central Services. The field is very gradually moving to the sharing of certain services and facilities, even where the participants are widely separated geographically. A prosaic illustration is the laundry, where across the country a growing number of groups are now active. Many other kinds of arrangements to share facilities and equipment will be developed. It is believed that a central laboratory service using very costly equipment for many procedures is quite feasible, and will reduce costs substantially while improving and standardizing procedures. Such centralization also contributes to a pooling of skilled and scarce personnel.

Equipment is now available which is said to be capable of processing as many as 2200 blood tests daily, with one or two technicians. A skilled analyst using manual methods might complete a similar volume of work in several weeks. Here again the single small hospital could not justify such equipment, nor would it by itself have this much volume to even warrant consideration. But by combining many hospitals, volume of course is achieved, through which economies can be obtained.

Organization and Administration. Still another logical compact arrangement will be developed involving basic organization and administration of several hospitals. This relates to two or more hospitals, geographically separated, entering into an agreement to share an administrator, and from that point other personnel and services. There is really nothing new about this thought, and there are existent a few examples across the country. But the benefits are so obvious it is difficult to understand why there aren't more. One apparent difficulty has to do with that old shibboleth of hospitals—autonomy. But there is no reason why this should be a real barrier if the arrangement is appropriately and mutually developed.

Previously I said that the key to "survival" lay in compacts such as mentioned, but also stressed the importance of regional hospital council staffing. For unless the latter occurs, the kinds of programs described will be much more difficult to mount, and longer in activation. This means a willingness of hospitals to increase substantially their organizational dues to a point possibly greater than the combined national and state. The executive head of the organization must be as fully qualified as the state director.

It will be his responsibility to help in the shaping of new approaches to cooperative ventures.

Entirely aside from the joint programs involving multiple hospitals, there is one other significant and I believe highly desirable factor that will greatly influence small hospital development in the future. This is a step that will involve most hospitals in a new type of service, and one that will be of substantive benefit to the community. But aside from these aspects, it will have considerable economic implications.

This relates to the hospital's assuming direct responsibility for long-term care as an integral part of its operation. One of the critical problems of small hospitals is its limited economic base. Already discussed has been the multiple or compact approach, which in itself broadens each unit's capabilities. But the addition of long-term care beds is a practical way of not only meeting an acknowledged community and social need, but also strengthening the whole economic structure of the hospital enterprise. It will be possible to spread costs across 80 beds vis a vis 40 acute alone, and so on. Admittedly, this is on the premise that reimbursement under Titles 18 and 19 will be adequate; my assumption is that this will be so.

MY BELIEF IS THAT there will be a very rapid extension of the hospital into the long-term care field. The term "small hospital" will eventually only be a relative term, as likely the typical small hospital will be at least 100 beds. And another development I predict is that in many of these hospitals the acute section will be in the minority. This will call for quite an adjustment in our thinking as to what represents hospital care and services.

Perhaps these comments have covered too many aspects of the small hospital—its dilemmas and prospects. To be sure the small hospital does have some unique and frustrating problems. But the small hospital has never had a more promising and truly exciting future. The isolation and insularity of the past are rapidly disappearing. Through a combination of many forces and influences hospitals will be linked together in numerous ways. The acknowledged gap between the large, urban hospital and the small institution will be substantially erased.

Through computer and television networks (and I suspect other devices today unknown) hospitals will be brought together in a fashion that will truly "regionalize" medical care, from the local physician's office to community hospital to regional center to university teaching complex. Many services will be combined involving hospitals widely separated geographically. The community hospital itself will be numerically larger in the sense of total beds, as it embraces long-term care on an extensive basis. It is difficult to identify any opportunities in the field that will be more challenging, interesting, and provocative than those related to the small hospital. To borrow a phrase "This is where the action will be."

Lateral Abdominal Tenderness: Spigelian Hernia

ABSTRACT — The case of a 39-year-old male with a two-week history of vague right lower quadrant pain is presented. Surgical exploration revealed a hernial orifice that contained a Richter's hernia in a Spigelian location. A necrotic area of the anterior cecal wall was found. The necrotic area of cecum was resected and repaired with a two-layer closure. The hernial orifice and surgical incision were closed in a transverse fashion.

BY MARTIN BEARD, M.D.

A. VELANDER, M.D.
MINNEAPOLIS

Lateral ventral hernias generally cause no difficulties in diagnosis and are seen with moderate frequency. The greater percentage of these are inguinal or femoral hernias. A more unusual hernia is the spontaneous lateral ventral hernia — Spigelian hernia — that appears to be reported with increased frequency in the recent literature.

During the past year, one case was seen at the Minneapolis Veterans Hospital. This case is reported below.

CASE REPORT

L. V. Y., MVAH:

A 39-year-old white male was admitted to the Surgical Service of the Minneapolis Veterans Administration Hospital on 9/19/66 because of right sided abdominal pain of two weeks duration. The abdominal pain had become worse on the a.m. of the date of admission. There was no history of jaundice, dark urine, clay colored stones or melena. There was no history of recent abdominal trauma.

The patient did admit to fatty food intolerance and frequent belching following the ingestion of cabbage. Several days prior to admission, the patient had helped in the roofing of a house.

Past history revealed that the patient underwent an appendectomy as a child, had a subtotal gastrectomy at age 23 for a gastric ulcer and had been examined for back pain. Normal cholecystogram was demonstrated one year prior to admission.

The initial laboratory data showed the following: Urinalysis - Normal; Sugar - 0, Albumin - 0; Hematology - WBC - 18,300, neutrophils - 89, lymphocytes - 11, Hbg - 14.0 gm.%; BUN - 8 mgm.%; Bilirubin - total 0.5 mgm.%, direct 0.1 mgm.%; Stool Guaiac - Neg; Serum amylase - 58 units; Prothrombin time - Normal.

Physical examination: B.P. 134/80, Temp. 99.4 (0), Pulse - 84/mm. Well developed and well nourished male.

Positive physical findings:

1. Healed left subtotal gastrectomy incision.
2. Healed McBurney's type incision of right lower quadrant.
3. Point tenderness and pain just lateral to right rectus muscle, but medial to old McBurney's incision.

The pain persisted after a period of six hours while the patient was put on nasogastric suction. There was no radiation of the pain and it was more severe with straining and standing.

The patient was taken to the operating room on 9/19/66 and through a transverse incision, the skin and subcutaneous tissues were incised. A small area of induration measuring 2 x 2 centimeters could be palpated adjacent to the right rectus muscle, but medial to the old McBurney incision. The indurated area reduced into the peritoneal cavity under relaxation due to the general anesthesia. A transverse defect was present in the lateral musculature with preperitoneal fat, transversalis fascia and peritoneum protruding through the separated muscle bundles. The peritoneal cavity was entered and a necrotic area of

Doctor Velander is a resident with the Department of Surgery, University of Minnesota and the Minneapolis Veterans Administration Hospital.

the anterior cecal wall was noted. The necrotic area of the cecum was removed and the defect closed in standard two layer fashion. Palpation of abdominal wall was negative. The small and large bowel were examined, the abdominal cavity was irrigated, and the abdominal wall was closed by approximating the peritoneum and transversalis fascia in one layer and closing the fascia, subcutaneous tissue and skin along the line of incision.

The patient developed a superficial wound infection postoperatively, but this healed without consequence.

DISCUSSION

Adrian Van Der Spiegel, (Figure 1) a disciple of Fabricus, was the first to describe the linea semilunaris. An early work of Spiegel's contains this description (Figure 2).

The first to recognize a hernia of the linea semilunaries was probably La Charesse, but this hernia was considered to be traumatic in origin.[5] Klinkosch presented the first vivid description and first located a spontaneous lateral ventral hernia of the linea semilunaris.

Anatomically, the linea semilunaris extends from the ninth costal cartilage, in a curved manner, on the anterior abdominal wall to the pubic spine. It marks the lateral boundary of the rectus abdominal muscle.

There appears to be some confusion as to what constitutes Spiegel's line. Watson states that the linea semilunaris is formed by the aponeurosis of the internal oblique at its point of division to enclose the rectus abdominis muscle.[4] River feels that the linea semilunaris is the transition between the muscle bundles of the internal oblique and the

3	3	0.6
Total	109	21.8

TABLE II

Defects of internal oblique and transverse abdominus aponeurosis alone or together and superimposed as found in 100 body halves. (Taken from Zimmerman, Anson, Morgan and McVay)

Defects	No. of Cases	Percent of Cases
a. One or both internal oblique and transversus not superimposed.	45	45
b. Internal oblique alone.	25	25
c. Transversus alone.	10	10
d. Internal oblique and transversus superimposed.	6	6
e. Transversus cranial to that in internal oblique.	4	4
Total	100	100

aponeurosis of the same muscle.[6] This places the line lateral to the border of the rectus muscle. In practice, Spiegel's line is a broad band[3] and is referred to by some writers as Spiegel's fascia.[5]

The most common site of Spiegel's hernia is below the umbilicus along the lower one third of the linea semilunaris. The muscle fibers of the transversus reach behind the rectus in the upper two thirds or three fourths of the line. This probably accounts for the rarity of herniations above the umbilicus.

Factors that favor spontaneous lateral ventral hernias are obesity, paralysis, multiple pregnancies, emaciation following obesity, chronic cough, straining or increased intra-abdominal pressure from any source. Cooper feels that protrusions occur through perforations that transmit vessels when these orifices are of unusual size or enlarged during a relaxed state.[8] Some writers report the importance of the weak spot that exists where the semilunar line crosses the fold of Douglas[4] (Figure 3). River has described slit-like defects in the aponeurosis of the transversus as it passes forward and fuses with the internal oblique.[6] Some authors ascribe great significance to the lateral branch of the inferior epigastric artery transversing one of these defects.[6] The orifices are described as being 0.5-0.2 cm. in size and seldom larger.

Zimmerman, Anson, Morgan and McVay have shown that the inferior medial extent of the internal oblique and transverse muscle sometimes consists of interdigitating muscle fibers separated by weak aponeurotic structures through which herniations occur. Their findings are shown in Tables I and II.[13]

As shown in Table II, defects in the transversus and internal oblique aponeurosis were superimposed in 6% of the body halves. This allows for potential herniation in this 6% of cases.

The explanation of Zimmerman et al appears to best explain the anatomical basis of the lateral spontaneous ventral hernia since blood vessels do not accompany the hernia orifices with any consistency and there does not appear to be any one site of weakness where the herniation occurs.

Spigelian hernias occur in both sexes with equal frequency and are more prevalent in the fifth and sixth decades.[5] Since January, 1958, 2541 inguinal hernias and only 6 Spigelian hernias have been

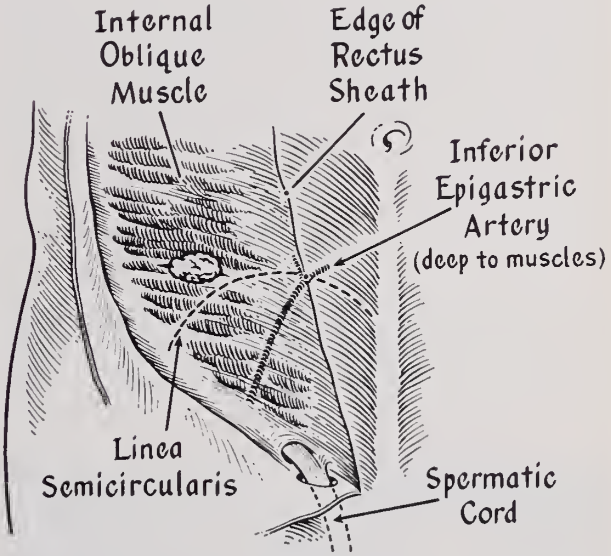

FIGURE 3: An artist's illustration of the course of the inferior epigastric artery deep to the abdominal muscles. The orifice through which the lateral branch of the inferior epigastric artery passes has received great emphasis as the site of the Spigelian hernia. The point where the semilunar line crosses the fold of Douglas has also been incriminated as the site of Spigelian hernias.

surgically corrected at the Minneapolis Veterans Administration Hospital.

Lower abdominal tenderness or pain aggravated by straining or standing and relieved by lying down is characteristic of a Spigelian hernia. The patient may complain of a lump that comes and goes and is located below the umbilicus and lateral to the rectus muscle; it may have a gurgling sound. A Spigelian hernia may stimulate appendicitis, cholecystitis, urinary bladder stones, salpingitis, appendiceal abscess and hematoma or tumor of the abdominal wall. When the ordinary abdominal exploration does not explain lower quadrant pain, the anterior abdominal wall should be carefully palpated from the peritoneal side for the defect of the Spigelian hernia as the hernia may well reduce under muscular relaxation or the slightest manipulation at the time of surgery. Herniations through the semilunaris are usually small and spread beneath the intact external aponeurosis, but large Spigelian hernias do occur.[9]

A symptomatic hernia should be surgically repaired. The neck of the sac should be ligated or sutured after it has been dissected free. As with any hernia, nonviable intestine or strangulated omentum should not be overlooked. The peritoneum and transversalis fascia are sutured and the overlying muscles and aponeurosis are closed with interrupted sutures. A Mayo type repair is sometimes used.[5] A transverse incision over the point of tenderness is very useful.

SUMMARY

A case report of Spigelian hernia with a Richter's component has been presented with a brief review of the literature. In cases of lower lateral abdominal pain and/or tenderness, the differential diagnosis includes Spigelian hernia. Identification of the hernial orifice with ligation or suture of the sac and repair of the overlying muscles and aponeurosis constitutes adequate surgical therapy.

Coaches, Trainers Team Physicians Get Many Pointers

One hundred coaches, trainers, principals and team physicians conferred in Detroit for the Third Annual Michigan Conference on Medical Aspects of High School Sports, sponsored by MSMS and the University Center for Adult Education (WSU-EMU-UM).

Robert J. Murphy, M.D., team physician at Ohio State University, makes a point on "Medical Aspects of Athletic Conditioning" to an audience of team physicians, coaches, and trainers at the MSMS Conference at the Rackham Building.

Team physicians and coaches from Ottawa County talk with James Feurig, M.D., lower left, chairman of the MSMS sponsoring committee and MSU team physician, during the annual Sports and Medicine Conference. Each year, the Ottawa County Medical Society sends a group to the conference as a public relations project.

Richard H. Smith, M.D., right, of Detroit, chats with an old friend, Leslie M. Bodnar, M.D., Notre Dame team physician, during the recent MSMS Conference. Doctor Bodner, who spoke on "Ankle and Knee Injuries," was an instructor in South Bend, when Doctor Smith was interning there.

Reviewing some of the comments made by Howard (Jeep) Mehaffey, D.D.S., right, a former U-M fullback and guard — now with the Michigan Department of Public Health — are William Taft, center, Lansing Waverly High coach, and H. Ross Hume, Jr., M.D., of Detroit, a member of the MSMS sponsoring committee and physician for the Detroit professional soccer team.

CITES STATISTICAL DIFFERENCES

Says Programs for Aging Need More Sophisticated Approach

The concept that people over 65 are essentially alike is one of America's "romantic fallacies." Vast differences exist in income, age, sex and education, according to Dean Walter M. Beattie, Jr., Syracuse University School of Social Work.

Dean Beattie, who spoke at a Wayne State University Symposium, "Extending the Life Span: The Impact on Man," noted that within each five year period more than a third of the older population is new to the age group. All of these newcomers have lived through a different period of history, a somewhat different culture, changed schooling, changed economic conditions than have older members.

These differences should be taken into account when planning services, housing, options and alternatives. Yet, most of our planning and service provisions have been based on the concept that somehow all people over 65 are alike, he said.

A statistical breakdown of group characteristics shows the need for a more sophisticated approach when developing programs for our older population, he intimated.

EACH YEAR SOME 1.4 million people reach 65 years while 1.1 million die. Thus, some 300,000 older persons are added annually to the older population. This group exhibits vast differentials of experience, resources, and background than those 73 years and older, born before 1894, who make up half of the older population. Of every 100 older persons today, six are 85 and older. This six percent represents about one million people born before 1883 and includes some 16,000 Centenarians born before or during the Civil War.

The older population exhibits a disproportion of sex ratios: currently 11 million women to about eight million men. In the younger aged groups, 65-74, there are 125 women for every 100 men. At the other end of the continuum, 85 and over, there are 160 women for every 100 men.

Dean Beattie related to the WSU symposium the differences in education to earnings, work and social status, communications, understanding, taste, pursuits and attitudes. Currently, nearly 17 percent, three million of the older population, have less than five years of elementary schooling. They are functionally illiterate. Five percent are college graduates. But a different group of older persons will emerge by the end of the century, he said, in terms of educational resources and ability to cope with changing situations.

CONTRARY TO POPULAR belief, only a small minority of the aged live in institutions. Ninety-six percent live in the community, about 70 percent in family settings and 26 percent alone or with relatives. Close to 30 percent of those 65 and over, who reside outside of institutions, are at or below the poverty level.

Their biggest source of income, almost one-third of total revenue to all over 65, is earnings. The combination of payments from regular retirement programs contribute about 40 percent; 30 percent is derived from Social Security and six percent from Railroad Retirement and Civil Service. Only three percent of income is attributed to private pension plans.

THE OLDER POPULATION spends almost all disposable income on a hand-to-mouth basis for consumption goods: food, shelter, clothing and medical care. They represent very large proportions of urban poor.

Dean Beattie told the Detroit audience that the median value of all assets of older people totals some $11,200. But if one takes away home ownership, the median assets total only $3,000. Personal debt amounts to about one percent of assets.

He suggests that sound social policies, which would vest the right to retirement benefits in the individual and allow people to "carry" retirement provisions from one area of employment to another, could substantially raise the economic level of future retirees.

"In consumer patterns, older persons live a very marginal life as compared to the rest of the population," he concluded.

(Statistical data for Beattie's comments were taken from: "A Profile of the Older American," by Herman B. Brotman, U.S. Department of Health, Education and Welfare, Oct. 16, 1967).

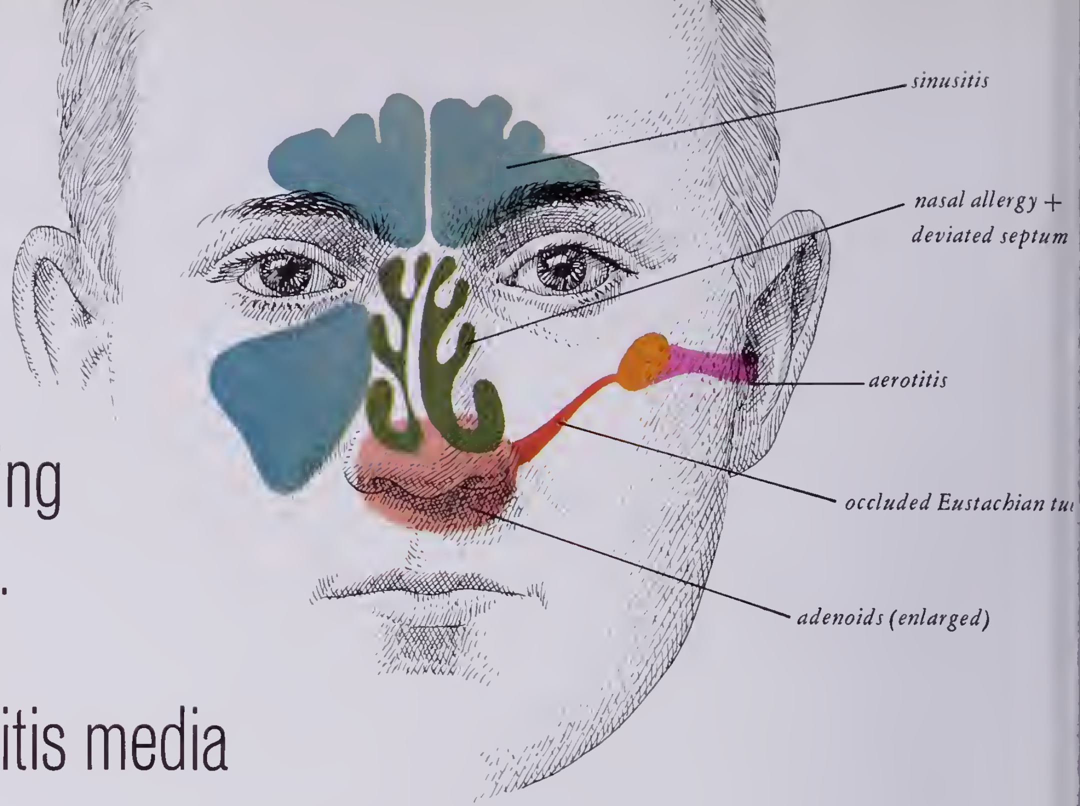
serous otitis media
an original article
by Robert H. Lofgren, M.D.



the complaining earache... key to serous otitis media

Robert H. Lofgren, M.D.
Associate Surgeon, Massachusetts Eye and Ear Infirmary, Boston, Massachusetts

Serous otitis media is probably the most common ear problem in children, especially in the wintertime. Diagnosis is usually easy in adults, but may be quite difficult in children, especially the very young child where one has to depend almost entirely on the physical findings.

The symptoms of serous otitis are a fullness in the ear, a mild hearing loss and mild earache. The earache can best be described as a "complaining earache" instead of a "screaming earache" as found in purulent otitis media. A young child may be irritable and pull at the ear. In milder cases, and as the ear recovers, gurgling and popping noises can be heard in the ear.

On examination one may see a yellow tympanic membrane and if a fluid level is present the diagnosis becomes easy. However, the eardrum may be dull gray, or slightly pink, or even perfectly normal. Pneumomassage using a Siegle otoscope or a closed-head electric otoscope must be done on both ears, otherwise the diagnosis will be frequently missed. Attempted movement of the drum with the pneumatic otoscope produces either a sluggish motion of the drum or no motion at all instead of the easily movable normal drum. The Rinne test is negative and there is a 15-20 decibel conductive hearing loss. The bone conduction may be better than normal and an air-bone gap may exist even with the air conduction within normal limits. Occasionally one finds a false nerve deafness on the audiogram when thick glue-like fluid causes immobility of both the oval and round window. Both conditions return to normal when the fluid is removed, but they make the interpretation of screening audiograms very difficult.

There is no single cause for serous otitis. One factor always present is blockage of the eustachian tube, but this alone is not enough to produce fluid. There must also be an inflammatory reaction. Blockage of the eustachian tube may be caused by many conditions. In children the most common cause is enlarged adenoids. In the summer the next most common cause is allergy. Upper respiratory infections or influenza are common causes in the winter. Nasal allergy, acute and chronic sinusitis, nasal septal deformity and cleft palate can all cause eustachian tube obstruction. Some children may have a congenitally small eustachian tube, but fortunately they usually "grow out of the problem."

The first sign of a nasopharyngeal tumor is often a serous otitis. One must always rule this out in any adult who later in life develops repeated or persisting serous otitis. Causes sometimes overlooked are nasogastric tubes after surgery, simple obesity and cardiorenal disease, which may produce congestion in the mucosal lining of the eustachian tube. In recent years we have been seeing a new cause—acute otitis media, where the patient is adequately treated with antibiotics but where drainage has not been established either through the eardrum or down the eustachian tube. A sterile exudate is left in the middle ear.

The inflammatory response may be caused by a marked negative pressure as in air otitis from flying, or it may be from a mild bacterial or viral infection in the middle ear. Serous fluid is a good culture medium and will frequently go on to purulent otitis media, especially if the original blockage was caused by an infectious process such as acute rhinitis or adenoiditis. When the infection heals there may be scarring in the middle ear mucosa. Mucous glands develop in this tissue and pour out a thick mucoid material. This ear usually looks normal until a pneumatic otoscope is used. The objectives in treating serous otitis are to remove the obstructing agent and to provide drainage from the middle ear. Often this can be accomplished by decongestants and nose drops. If large obstructing adenoids are present they should be removed. Sinusitis should be treated with oral decongestants or nose drops, plus antibiotics where indicated. Nasopharyngeal tumors should be treated. Allergies should be treated with antihistamines and, where indicated, by desensitization.

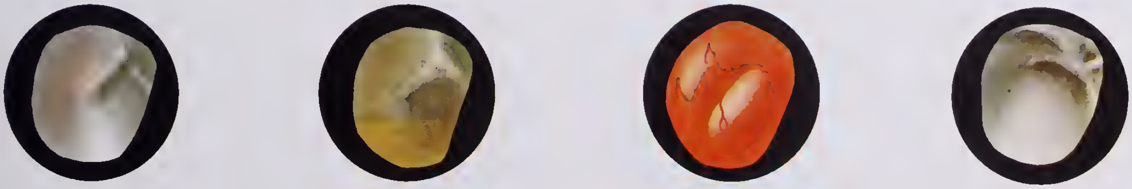
If the fluid does not clear with medical treatment within a week or two, a myringotomy should be done. If there is a question of active infection or if the fluid looks purulent, as is seen at the conclusion of acute otitis, cultures are taken. On adults this can be done in the office without anesthesia. It is no more painful than an intravenous needle for a blood test. A good safe topical anesthetic has a tremendous psychological value to the patient. Children under the age of 1 require no anesthesia. Between the ages of 1 and 3 anesthesia is not absolutely essential although a general anesthetic may be used to avoid the child's possible mistrust at follow-up examinations. I usually do the myringotomy at the same time as the adenoidectomy if the adenoids are enlarged. Once drainage has been established with decongestants or by myringotomy, positive pressure inflation of the middle ear is invaluable in forcing out the serous fluid and keeping it from reforming. The patient can do this himself by performing the Valsalva maneuver. This should be done several times a day, by taking a deep breath, holding the nose and blowing hard against the closed lips for a second or two.

In resistant cases where the fluid reforms as soon as the myringotomy heals, small polyethylene tubes are inserted through the myringotomy site. Insertion of the tubes, even in adults, usually requires an anesthetic. Good anesthesia can be obtained by infiltrating the canal wall with a local anesthetic, using a #27 needle. Once inserted the patient has no sensation of the tubes' presence. Be careful to caution the patient or parents not to allow any water to get into the ear canal while a myringotomy is open or a tube is in place. Water can be kept out by a pledget of lamb's wool in the ear canal or a cotton pledget thickly coated on the outside with petroleum jelly. I check these patients a week after a myringotomy to be sure it is healed and at two month intervals until the tubes have fallen out, usually within three to six months after insertion.

The mucoid type of fluid is so thick and tenacious that it is appropriately called a glue ear. It is aspirated only with difficulty through the eardrum, and occasionally must be removed through a tympanotomy. This thick, glue-like fluid is prone to recur, as the myringotomy usually heals long before the mucous membrane has returned to normal. Repeated myringotomies, as many as ten or twenty, were formerly required for this condition. Now polyethylene tubes are inserted initially when this thick, glue-like material is found. At times a subacute mastoiditis may accompany the serous otitis, which will necessitate a simple mastoidectomy before the condition can be eradicated. Usually the thin serous fluid readily responds to decongestants or to a myringotomy and removal of the eustachian tube obstruction. Occasionally, however, even serous fluid will repeatedly reform. For this, resection of the tympanic plexus of nerves which lies on the promontory of the middle ear has been carried out, as the tympanic branch of the glossopharyngeal nerve is the secretomotor nerve to the ear.

Failure to diagnose serous otitis is the most common cause of the recurrent, almost continuous otitis me-

Otoscopic Views



Normal　*Acute Serous*　*Acute Purulent*　*Chronic Serous* dia seen in young children. In these cases a myringotomy will frequently provide a long-term cure without adenoidectomy or any other surgery. Failure to do this may allow the condition to go on to acute or subacute mastoiditis. Adhesive otitis media with scar tissue binding down the ossicles or tympanosclerosis may also result with permanent impairment of hearing. The prognosis for hearing with adhesive otitis or tympanosclerosis is usually poor. If the adhesions are removed, they reform, and the same is frequently true of tympanosclerosis even after a tympanoplasty. For many of these people a hearing aid is the only solution. The constant negative pressure in long standing serous otitis media may draw in either Schrapnell's membrane or the posterior superior portion of the eardrum forming a pocket to cause a chronic otitis media with cholesteatoma, which may not become apparent until twenty or thirty years later.

The non-medical complications of improper diagnosis or treatment may be even more serious. The irritable child, the frequent bouts of acute purulent otitis media with pain and fever, the expense of antibiotics and doctors, and the time lost from school or work affect the entire family.

In summary, serous otitis has many causes. There is a blocking of the eustachian tube and an inflammatory reaction in the middle ear mucosa, the latter usually caused by a mild infection. The treatment is to provide immediate drainage by decongestants and where necessary, by a myringotomy. The obstructing agent must be removed by surgery if it is adenoid or by oral decongestants, and antihistamines or nasal spray if it is an upper respiratory infection or allergy. Occasionally resistant cases require plastic tubes placed through the eardrum or other more radical surgery. Failure to treat properly leads to hearing loss which may be permanent, repeated acute otitis media or possibly even chronic otitis media with cholesteatoma.

You can relieve his congestion and sniffles and her concern with

"The Orange Medicine"

You know it as Triaminic Syrup, but mothers of kids with colds and allergies know it as the orange-colored, good-tasting medicine that makes life a lot more livable at either end of the teaspoon. Triaminic Syrup contains not one, but two antihistamines, plus an effective oral nasal decongestant. This balanced formulation has promptly and effectively relieved nasal congestion for so many.

TRIAMINIC® SYRUP

Each teaspoonful (5 ml.) contains: phenylpropanolamine hydrochloride 12.5 mg.; pheniramine maleate 6.25 mg.; pyrilamine maleate 6.25 mg. Side effects: Drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The possibility of drowsiness should be considered by patients engaged in mechanical operations requiring alertness. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis. Dosage: Children 1-6, ½ tsp.; Children 6-12, 1 tsp.; Adults, 2 tsp. Administer every 4 hours. Supplied: Bottles of 4 fl. oz., pints.

Now . . . a new
alternate salicylate product
from Warren-Teed

Magan®
(magnesium salicylate, W-T)

magan

an alternate salicylate

particularly offered for the management of those chronic arthritic and rheumatic patients with gastrointestinal intolerance to aspirin and other salicylates

pain relief comparable to aspirin

Magan may provide effective salicylate therapy for a substantial number of your patients who cannot tolerate other salicylates because of gastrointestinal irritation.

Magnesium salicylate is recognized as a safe and effective alternate to aspirin. A controlled clinical study showed Magan to be not significantly different from aspirin as an analgesic in the treatment of arthritic patients.[1]

Reports from a private practice experience study indicate that Magan was tolerated by a high percentage of patients judged by their physicians to be unable to take aspirin or other salicylates due to gastrointestinal intolerance.[2]

(See next page for prescribing information)

A different salicylate structure—
with no coating, no buffering
and it is sodium free

magan®

(Magnesium Salicylate, W-T)

microphotograph of magnesium salicylate crystals

Composition: Each orange-colored compressed tablet contains 5 grains (approximately 325 mg.) of magnesium salicylate, W-T (salicylic acid equivalent 75%).

Actions, Indications, Uses: The analgesic, anti-inflammatory, and antipyretic effects of MAGAN are similar to those of aspirin and other salicylates. Accordingly, MAGAN is indicated for the treatment of rheumatoid arthritis, osteoarthritis, nonarticular rheumatism such as bursitis, painful-shoulder syndrome, tendosynovitis, fibrositis, and other musculoskeletal disorders. The drug is also useful for the symptomatic relief of pain, aches, and discomfort of headache, neuralgia, minor injuries, dysmenorrhea, common cold and other minor infections of the respiratory tract. MAGAN (Magnesium Salicylate) may be tolerated by some persons intolerant to aspirin by reason of gastrointestinal irritation.

Contraindications: Because of the danger of hypermagnesemia, MAGAN is contraindicated in cases involving advanced chronic renal insufficiency. MAGAN, as other salicylates, may counteract the effect of uricosuric agents, and should not be prescribed for patients on such drugs.

Warning: As with all salicylates, high dosages of MAGAN should be avoided entirely or administered with caution to patients with liver damage, preexisting hypoprothrombinemia, vitamin K deficiency, and before surgery.

Adverse Reactions and Precautions: The same precautions applicable to salicylate therapy in general should be followed in prescribing MAGAN. Appropriate precautions should be taken in prescribing MAGAN for persons known to be sensitive to salicylates. If reaction develops, drug should be discontinued. Dosages of anticoagulants should be reduced with the administration of high dosage levels of MAGAN. *Impaired Renal Function:* Appropriate precautions should be taken in administering MAGAN to patients with any impairment of renal function including discontinuing other drugs containing magnesium and monitoring serum magnesium levels particularly if dosage levels of MAGAN are high. *Salicylate Poisoning:* Symptoms of salicylism, resulting from high doses of MAGAN, can be expected to resemble closely in character and intensity those associated with aspirin poisoning. These range from dizziness, drowsiness and ringing in the ears to vertigo, convulsions, coma and hypokalemia. Salicylate poisoning can be treated by intravenous fluids with sodium bicarbonate or lactate and potassium supplementation. In very severe cases, hemodialysis may be necessary. Vitamin K, 5-20 mg. orally or slowly i.v., usually restores the prothrombin time to normal.

Dosage: Adults 1 or 2 tablets every 4 hours as required with a full glass of water. In arthritis and other rheumatic conditions, higher doses may be used at the discretion of the physician. The experience with MAGAN in children is limited. The drug should not be used, therefore, for patients below 12 years until indications for use and dosage have been established.

How Supplied: Bottles of 250 and 1000 tablets.

Urge Every MSMS Member Attend September 25-26

Ask Residents, Interns, Seniors Confer Sept. 26

An educational "Conference on Office Management" will be offered for residents, interns and senior medical students on the afternoon of September 26 at the Sheraton-Cadillac Hotel in Detroit, during the MSMS Annual Session.

The MSMS Liaison Committee with Residents, Interns and Senior Medical Students has studied various topics for the conference. The Committee decided that the program should focus on basic principles of office management. Conference topics were narrowed to four: (a) opening an office, (b) selecting personnel, (c) billing system, and (d) evaluating partnership prospects.

"The Committee is grateful to Merck, Sharp and Dohme for financial support of this conference and feels that this unique event will not only be of educational benefit to the young or prospective physician but also will serve as an effective way of introducing him to the activities of the Michigan State Medical Society," reports Norman D. Henderson, M.D., East Lansing, chairman of the sponsoring MSMS Committee.

Four Day-Long Courses Set for Annual Session

The two-day annual MSMS Annual Scientific Session, Wednesday and Thursday, September 25-26, at the Sheraton-Cadillac Hotel in Detroit, will feature four, day-long postgraduate courses in "Infectious Diseases," "Pulmonary Diseases," "Blood Diseases," and "Difficult Decision in Digestive Diseases."

The Wednesday, September 25, courses on "Infectious Diseases" and "Pulmonary Diseases" will run simultaneously from 9:00 AM to 5:00 PM. Each course will involve approximately six hours of in depth discussion and presentation.

"Blood Diseases" and "Difficult Decisions in Digestive Diseases" will be held on Thursday, September 26 also from 9:00 AM to 5:00 PM.

All courses are limited to 45 persons; cost is $10 per course.

Advance registration is essential because of limitation of space.

Michigan Medicine will print further course information as it becomes available.

MARK CALENDAR TODAY FOR ANNUAL SESSION

New Applicants Deadline Soon For MVF-2 Plan

A new and expanded program of Blue Cross and Blue Shield benefits is now available to eligible MSMS members . . . but July 10 is the deadline for new applicants.

The new program inaugurates a realistic and up-to-date program of hospital and physician care benefits for MSMS members and their families. In addition to the well-known basic Blue Cross and Blue Shield benefits, it introduces benefits for care in convalescent facilities — outpatient psychiatric care — expanded benefits for nervous and mental conditions — plus the new Michigan Variable Fee system for paying physicians' reasonable and customary charges (MVF-2).

Complete details, rates and an application were mailed recently to every member.

Coverage will begin August 1.

All physicians presently enrolled in the MSMS-group for Blue Cross and Blue Shield coverage have also received details about the new MVF-2 Plan and will automatically be transferred.

International Health Speech Available

MSMS members interested in obtaining a copy of the address by William S. McNary, Michigan Blue Cross president, advocating an international reciprocity program for health care protection may obtain a copy by writing to Michigan Blue Cross, 441 E. Jefferson Avenue, Detroit 48226. Mr. McNary, speaking at the recent International Conference on Voluntary Health Insurance in Sydney, Australia suggested a voluntary program to answer the health problems of the international traveler.

Duncan J. McColl, M.D., center, Port Huron, who died May 26 received recent honors at the Wayne State University Medical School Alumni Association banquet in Detroit, May 15. Doctor McColl, who was graduated from WSU in 1893, was in the banquet spotlight with James J. Aiuto, M.D., left, the new president of the WSU Medical School Alumni, and Mario A. Petrini, M.D., retiring president.

LOWINGER LEADER IN RIGHTS GROUP

Paul Lowinger, M.D., Associate Professor of Psychiatry at Wayne State University, was elected national vice chairman of the Medical Committee for Human Rights at the annual convention in Philadelphia.

RECEIVES ADA AWARD

The American Dermatological Association has awarded its first Carl Herzog Fellowship for training teachers and researchers in dermatology to John J. Voorhees, M.D., Ann Arbor, a second-year resident in the U-M Hospital department of dermatology. The award includes a stipend of $10,000, and also $2,500 for equipment and travel.

D. J. McColl, 99, Dies; Was Honored By MSMS, WSU

Michigan's Foremost Family Physician for 1954, Duncan J. McColl, M.D., died May 26 in Port Huron Hospital at the age of 99.

"Doctor McColl has always devoted his energy and attention first to his patients and lastly to himself," said Charles N. Hoyt, M.D., acting secretary of the St. Clair County Medical Society, when Doctor McColl was named by MSMS as the Foremost Family Physician.

Illustrating this quality of Port Huron's late beloved physician, Doctor Hoyt cited an instance in 1952 when Doctor McColl, himself in the hospital with hemoglobin of 6.5 grams, could not be found by his physician: "In about an hour he returned to his room — he had been in the delivery room attending one of his patients."

On May 15 this year, Doctor McColl had attended the Wayne State University School of Medicine Alumni Association banquet, and had been presented with a Centennial Award.

Born on Nov. 24, 1868, on a farm in Elgin County, Ontario, Doctor McColl in 1889 entered the Detroit College of Medicine, which evolved into the Wayne State University School of Medicine.

He was graduated in 1893 and had been WSU's oldest living alumnus.

In 1896, Doctor McColl married Miss Helen Marr Clark, of Harbor Beach, and they settled in Elkton. Doctor McColl practiced there for 13 years, becoming the first president of the village. Then came six years in Croswell, and two years at St. Joseph Hospital in Milwaukee. In 1914 he moved to Port Huron where he practiced the rest of his life. He delivered more than 8,000 babies in Port Huron.

Survivors include a son, Clarke M. McColl, M.D., Detroit.

THREE U-M DEANSHIP CHANGES ANNOUNCED

John A. Gronvall, M.D., of the University of Mississippi Medical School, has been appointed Associate Dean for the U-M Medical School to succeed Alexander Barry, Ph.D., who will join the University of California School of Human Medicine at Davis. Dr. Gronvall, a pathologist, is associate dean and associate director of the University of Mississippi Medical Center.

Robert A. Green, M.D., who has served as assistant dean part time the past year, was appointed to the new position of Associate Dean for Student Affairs. The new office of Associate Dean for Academic Affairs will be filled by George R. DeMuth, M.D., member of the U-M pediatrics staff since 1956.

AREA REHAB WORKSHOP JUNE 27 AT SAGINAW

A Conference on Rehabilitation and Long Term Care will be held Thursday, June 27 through the joint efforts of the Bay-Arenac-Iosco, Saginaw, and Midland County Medical Societies. The MSMS Committee on Aging and the Saginaw Veterans Hospital also are cooperating in the seven-hour program at Saginaw County Hospital Rehabilitation Center.

MAP TV PROGRAM SWEEPS AWAY BLUES

Several Michigan physicians, Charles W. Sellers, M.D., associate editor of the *Detroit Medical News,* Bruce L. Danto, M.D., Director of Community Psychiatry at the Detroit Psychiatric Institute, and C. Howard Ross, M.D., an Ann Arbor writer, editor, and lecturer, joined host Hugh Brenneman, MSMS Executive Director, in a discussion of "Formula for the Blues" over WJIM-TV, Lansing, in the weekly series sponsored by the Michigan Association of the Professions.

MSMS, State Bar Studies Fee for Expert Medical Witness

What happens to the physician's fee, when on request of an attorney, he makes preparations to give testimony in court and then finds that the case is settled before the actual court appearance?

In 1957, MSMS and the Michigan Bar Association agreed on a statement of principle which read . . . "It is the responsibility of the attorney to advise his client of the physician's assistance and services in the case, and thus to cooperate with the physician for the purpose of seeing that such physician receives a reasonable fee for such services."

A joint meeting of the MSMS Liaison Committee with the State Bar of Michigan and the State Bar Medico-Legal Committee this spring recommended a rewording on this statement of principle as follows: "In cases where the physician aided in preparing the case but did not have the opportunity to testify or failed to testify because of a settlement prior to his being called as witness, it is the responsibility of the attorney to pay to the physician a reasonable fee for services rendered."

MSMS Council, at its April 17 meeting, approved this recommendation for rewording of the statement of principle.

The State Bar is currently studying the recommendation.

SLAGLE, SMITH ON NAT'L COUNCIL

George W. Slagle, M.D., of Battle Creek, chairman of the American Medical Association's Council on Medical Service, and Donald Smith, M.D., public health professor at the University of Michigan, have been named to a 21-member Advisory Council of the National Center for Health Services Research and Development, a new agency of the federal government.

The new center will work with universities, industry, hospitals, practitioners, and research institutions to seek new ways of delivering health care.

Doctors Slagle, a MSMS past president, and Smith will work with the advisory council which will be consulted on program development and practical operational problems involved in Medicaid (Title IX of Social Security).

GENESEE COUNTY PLANS 1969 DIABETES DAY

The Genesee County Medical Society has set the date for its fourth Diabetes Day, October 29, 1969.

Chairman for the Flint meeting next year is Franklin W. Baske, M.D.

John W. Moses, M.D., right, Detroit, arrives June 5 at the MSMS headquarters for his first meeting of the MSMS Publication Committee and the MSMS Council following his election by The Council in May as the new Scientific Editor of MICHIGAN MEDICINE. The official greeter is Brooker L. Masters, M.D., left, Fremont, member of The Council and chairman of the Publication Committee.

D. Bonta Hiscoe, M.D., of Lansing, talks with George Hunt, right, Managing Editor of LIFE Magazine, who gave the annual Yates lecture at Michigan State University recently, and Andrew Hunt, M.D., dean of the College of Human Medicine at MSU, brother of the LIFE Magazine editor.

Explains Dilemma In Medical Writing

"Whenever a story is chosen, there is a dilemma," said George P. Hunt, Managing Editor of *Life* magazine: "Is the story worth doing? Is now the time to do it? In the field of medicine, this dilemma is intensified."

Delivering the annual Yates lecture at Michigan State University, recently, Mr. Hunt observed that "In other stories there are clear rules and definite places where stories are found. But in medicine a major advance can just as easily come out of a small college or from Cal Tech."

"Even the experts," he continued, "don't all agree sometimes on whether something is really the first, the most, or a breakthrough."

"Another aspect of the dilemma," the *Life* editor said, "is that we have to be careful in reporting new advances in medicine. Will the story scare people? Will it raise false hopes?"

Mr. Hunt is the brother of Andrew Hunt, M.D., dean of the College of Human Medicine at MSU. The Yates lecture is an annual event sponsored by MSMS and other organizations which are interested in the advancement of science writing.

AMA Lauds MSMS Projects

Three projects of MSMS are described in the current issue of the *AMA PR Doctor* magazine published for county and state society doctors and staff members interested in better public relations.

One article suggested ways to improve town-gown relations and praised the "handsomely-designed" MSMS *Michigan Medicine* issue in 1967 which saluted the U-M Sesquicentennial.

Another voiced concern for better smoking-health educational programs and described MSMS support of the Michigan Council on Smoking and Health.

The third article reviewed the 1967 MSMS Workshop on Medical News Reporting sponsored at the U-M for science reporters, editors, program directors of TV and radio stations, as well as doctors serving on PR committees and bulletin editors.

Mutual Dependency

(The following editorial appeared recently in the Port Huron Times Herald:)

The Michigan State Medical Society is considering new approaches in education and enforcement to buck the spread of health quackery.

It's a big order, and an urgent one.

Dr. J. J. Lightbody, Medical Society president elect, says that phoney cures cost Americans some $3 billion a year. More than that, he says, they take more lives annually than all crimes of violence combined.

"Fraud, theft, death are strong, ugly words, but no single three words so well sum up the price society pays for lack of an effective program," he said.

The *Medical World News* in its March 29 issue examines facts and figures in one phase of quackery, treatments that are supposed to "cure" arthritis. Medical science admits that it has no cure at the present time, but 13 million victims of this ailment are receptive to almost anything that will give them a hope of relief, even a fantastic one.

It is estimated that at least 90 per cent of arthritis patients at one time or another fall prey to the empty promise — and frequently dangerous treatment — of an unqualified practitioner.

* * *

The problem is compounded because many of the quacks operate under a facade of respectability. Victims of their trickery are reluctant to bring action against them because they don't want to admit they have been cheated. Investigators term documented cases "the top of an iceberg," with no one knowing how much goes on under cover of anonymity.

The medical profession takes on a difficult assignment in seeking answers to this problem. It must do so in a way that will not discredit legitimate practitioners of the healing arts.

And it must do so in the clear understanding that it has a vested interest in closing down phoney health mills. The patients the investigators save may be their own.

Yet the hard fact is that there is no other source of expertise by which to judge the legitimacy of medical treatment than those who are of the medical profession.

The people must depend on them for honest judgment in this regard just as their patients depend on them for honest and competent judgment about physical disorders.

We can only urge the medical society to press forthrightly for means to control the quacks, wherever they are to be found, under whatever guise they are operating. And we urge every concerned citizen, and every organization, to co-operate in the effort.

The shattered hopes of hapless victims, along with uncounted wasted dollars and untimely deaths, are realities that must not be ignored. ☐

Enduron: (methyclothiazide) A basic building block for mild hypertensives

METHYCLOTHIAZIDE
100 No. 6812
ENDURON®
METHYCLO-THIAZIDE
5 mg

Excellent day-long Na^+ output, yet easy on the K^+

Enduron provides an excellent starting therapy. Your patient's sodium excretion is greatly enhanced. Yet potassium loss is low.

The therapeutic action is smooth, and persists for a full 24 hours. With Enduron you can prescribe convenient once-a-day dosage without skimping your patients on day-long thiazide effectiveness.

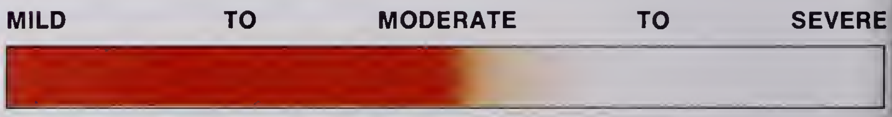
Of course, as with all thiazides, supplemental dietary potassium should also be considered.

Use Enduron as a basic therapy in patients with mild to moderate hypertension. A single 5-mg. tablet each day is ample in most cases.

Once a day, every day

ENDURON

METHYCLOTHIAZIDE



MILD

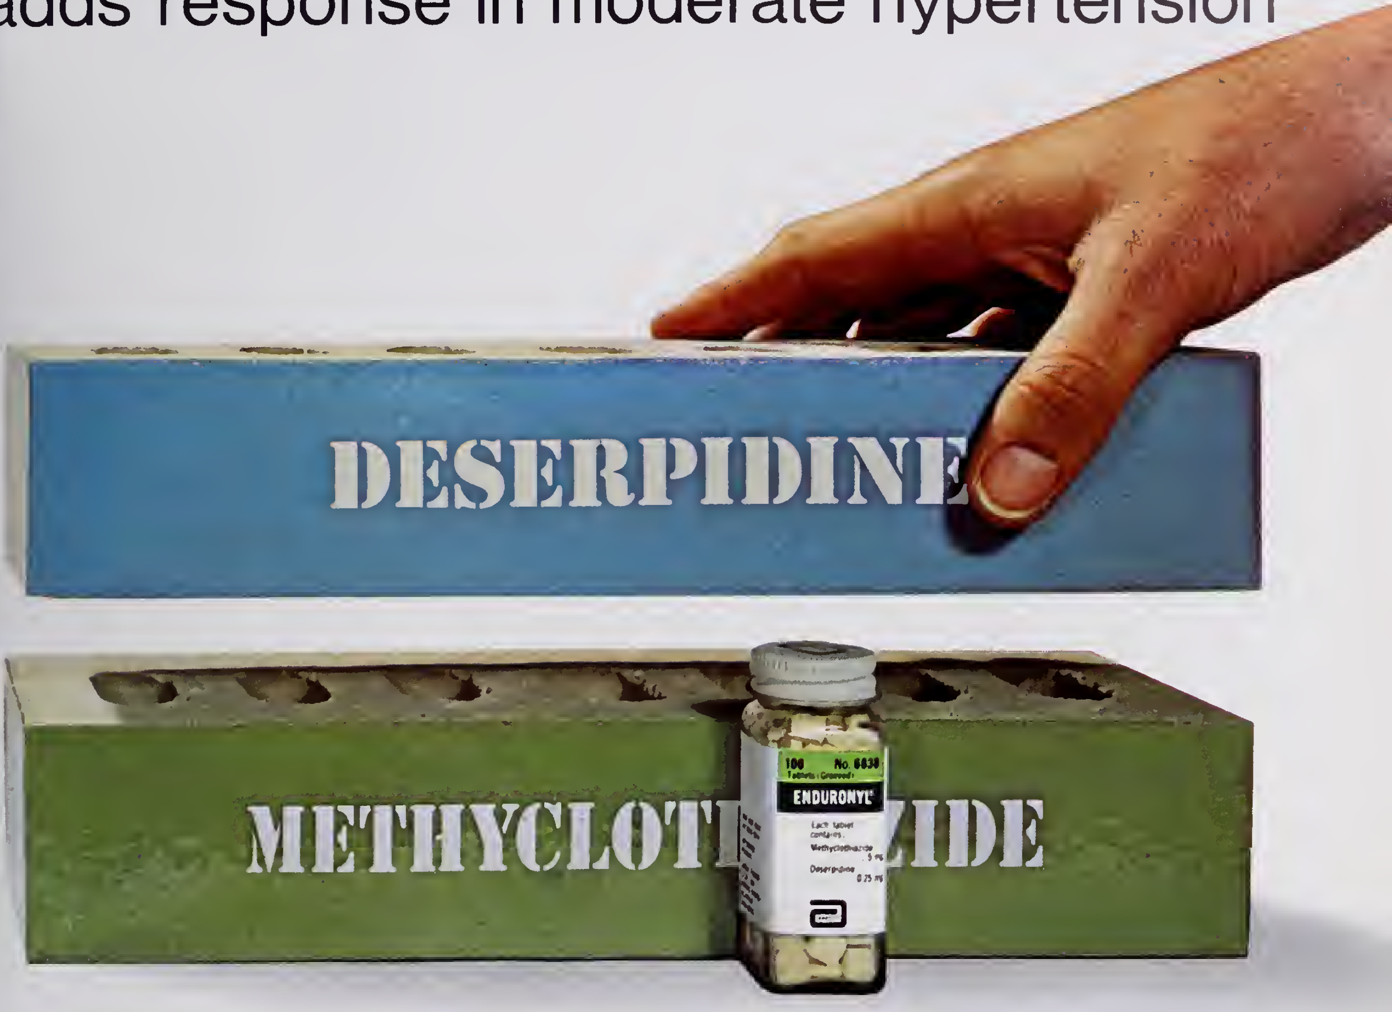
MODERATE
TO
SEVERE

See Brief Summary on final page of advertisement

Enduronyl: Its deserpidine component adds response in moderate hypertension



DESERPIDINE
METHYCLOT ZIDE
100 No. 6830
ENDURONYL
Each tablet contains:
Methyclothiazide 5 mg
Deserpidine 0.25 mg

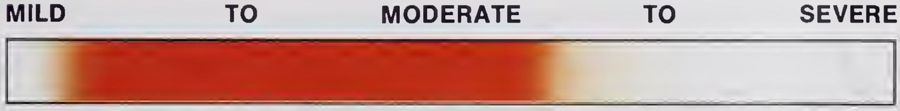
Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.



Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 mg. with
DESERPIDINE 0.25 mg. or (FORTE) 0.5 mg.

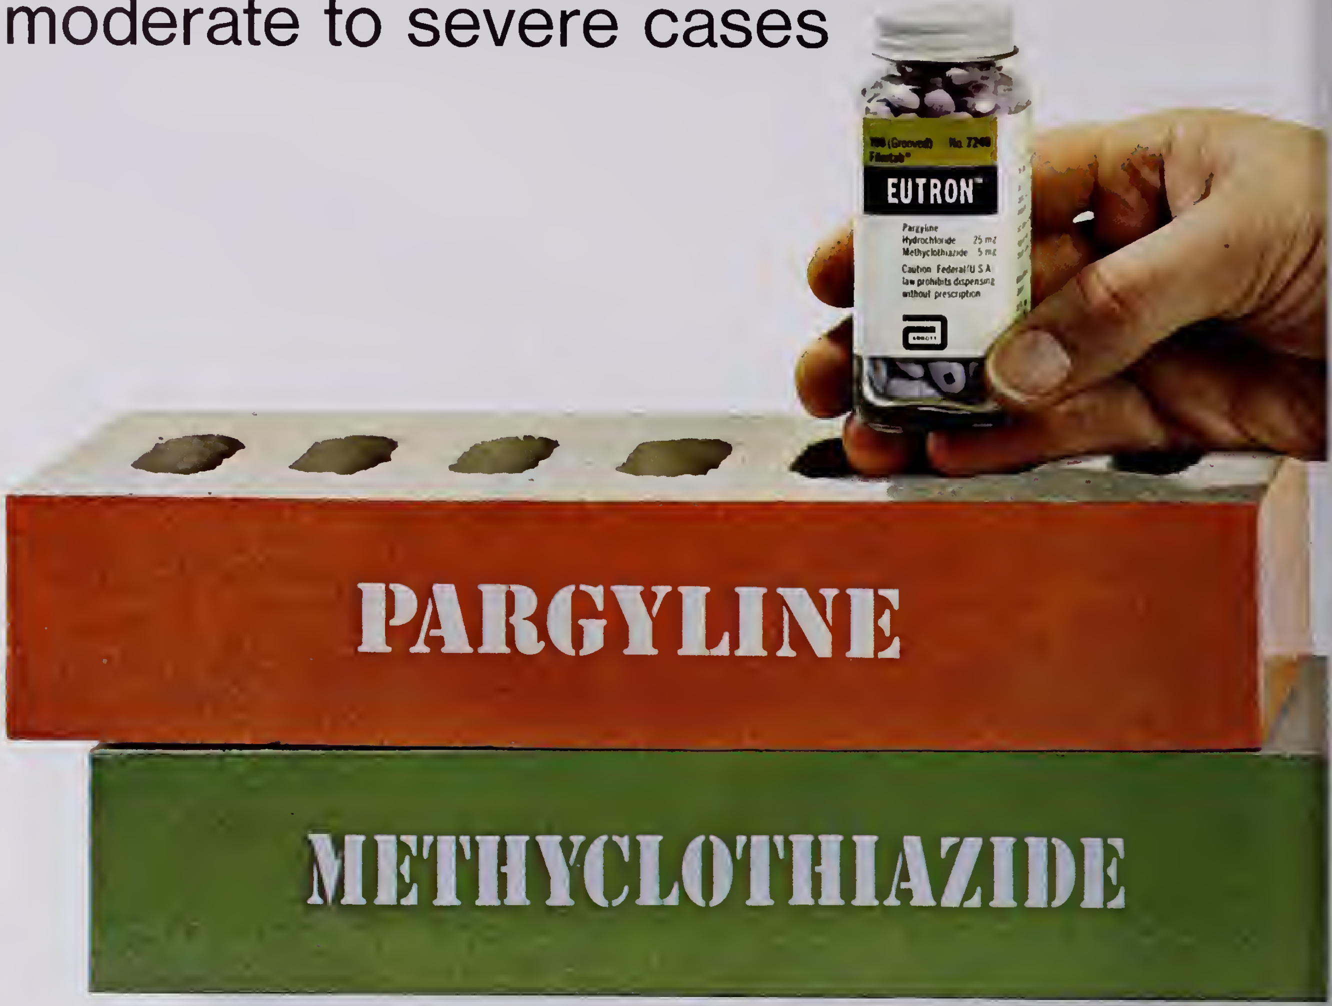
Eutron: A unique combination for handling moderate to severe cases



EUTRON™
Pargyline Hydrochloride 25 mg
Methyclothiazide 5 mg
Caution Federal/U.S.A. law prohibits dispensing without prescription
PARGYLINE
METHYCLOTHIAZIDE

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether your patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings were reduced from 112 pre-treatment to 90 post-treatment; *sitting* from 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearly alike in all three body positions.

Use Eutron for managing your moderate to severe cases. Its building blocks enhance each other; hence lesser doses often suffice.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

801094

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications—Moderate to severe hypertension.

Contraindications—Pheochromocytoma, paranoid schizophrenia, hyperthyroidism and advanced renal failure. Not recommended in malignant hypertension, children under 12, pregnant patients.

Do not use with: centrally or peripherally acting sympathomimetic drugs; foods high in tyramine (e.g., aged and natural cheeses); parenteral reserpine or guanethidine; imipramine, amitriptyline, desipramine, nortriptyline or their analogues; other monoamine oxidase inhibitors; methyldopa or dopamine; separate Eutron and these agents by two weeks.

Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease; impending hepatic coma from thiazide-induced hypokalemia.

Warnings—Patients: 1. No other drugs (particularly "cold preparations" and antihistamines), cheese or alcohol without physician's consent. 2. Promptly report orthostatic symptoms, severe headache, other unusual symptoms. 3. Angina pectoris or coronary artery disease patients must not increase physical activity with improved anginal symptoms or well-being.

Physicians: 1. Use antihistamines, hypnotics, sedatives, tranquilizers and narcotics (meperidine contraindicated) cautiously in reduced doses. 2. Stop Eutron two or more weeks before elective surgery; in emergency surgery reduce premedication (narcotics, sedatives, analgesics, etc.) to 1/4 to 1/5; carefully adjust anesthetic dosage to patient response. 3. Use cautiously in advanced renal failure. 4. Pargyline may induce hypoglycemia. 5. Consider possible sensitivity reactions when a history of allergy or asthma is present. 6. If potassium is indicated, dietary supplement is recommended; enteric-coated potassium tablets may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation frequently requiring surgery; discontinue medication immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs; Eutron does not contain added potassium. 7. Possible systemic lupus erythematosus has been reported for thiazides.

Precautions—Pargyline: Use cautiously at reduced dosage: caffeine, alcohol, antihistamines, barbiturates, chloral hydrate, other hypnotics, sedatives, tranquilizers, narcotics. Periodically do urinalyses, blood counts, liver function tests, etc. Use with caution in liver disease. Watch for orthostatic hypotension, especially in impaired circulation (e.g., angina pectoris, coronary artery disease, cerebral arteriosclerosis); also, augmented hypotension in concomitant febrile illnesses. Reduce or discontinue if hypotension is severe. In impaired renal function watch for cumulative drug effects, elevated BUN and other evidence of progressive renal failure; withdraw drug if these persist. In surgery increased central depressant response (hypotension and increased sedative effect) can be controlled by (1) discontinuing at least two weeks prior; (2) in emergency surgery lowering dose of premedication; (3) when necessary, administering a vasopressor. Do not use in hyperactive and hyperexcitable patients. Pargyline may unmask severe psychotic symptoms where emotional problems pre-exist. Use cautiously in Parkinsonism, especially with antiparkinsonian agents. In prolonged therapy, examine for change in color perception, visual fields, fundi and visual acuity. Also, prolonged therapy has made certain patients refractory to nerve blocking effects of local anesthetics.

Methyclothiazide: Use cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery thiazide may reduce vasopressor response and increase tubocurarine response. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia). Give supplemental chloride if hypochloremic alkalosis occurs and supplemental potassium if hypokalemia occurs (especially in digitalized patients). Thiazides may decrease serum P.B.I. without signs of thyroid disturbance.

Adverse Reactions—Pargyline: Orthostatic hypotension and associated symptoms, mild constipation, fluid retention, edema, dry mouth, sweating, increased appetite, arthralgia, nausea, vomiting, headache, insomnia, difficult in micturition, nightmares, impotence, delayed ejaculation, rash, purpura, weight gain, hyperexcitability, increased neuromuscular activity and other extrapyramidal symptoms. Drug fever is extremely rare. Reduction in blood sugar and hypoglycemic effects are possible. Congestive heart failure has been reported in a few patients with reduced cardiac reserve.

Methyclothiazide: Blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, blood sugar or serum uric acid (gout may be induced); anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice and pancreatitis. Cutaneous vasculitis in elderly patients has been reported with other thiazides.

If side effects are severe or persist, reduce dosage or withdraw drug. 804438R

COMING EVENTS

COLLER-PENBERTHY-THIRLBY EVENT SET AT TRAVERSE JULY 25-26

All Michigan physicians are invited to participate in the 48th Annual Coller-Penberthy-Thirlby Medical Conference at Traverse City, July 25-26.

The excellent program will begin at 9:00 a.m., July 25 and conclude at noon, July 26, according to James W. Hall, M.D., local chairman of the committee on arrangements. He reports that the out-of-state medical educators will come from California, Ohio, Florida, Missouri, Maryland, Nebraska, Minnesota, Texas, and Illinois.

MICHIGAN MEDISCENE

July 18-20 — MSMS Midsummer Session of The Council, Grand Hotel, Mackinac Island

July 20-21 — MSMAS Summer Seminar, Boyne Highlands, Harbor Springs

July 25-26 — 48th Annual Coller-Penberthy-Thirlby Medical Conference, Park Place, Traverse City

Aug. 21 — The Council, MSMS Headquarters, East Lansing

Sept. 22-23-24 — MSMS House of Delegates, Sheraton-Cadillac Hotel, Detroit

Sept. 24-26 — Woman's Auxiliary to the MSMS, Annual Convention, Statler-Hilton Hotel, Detroit

Sept. 24-26 — MSMAS Annual Session, Pontchartrain Hotel, Detroit

Sept. 25-26 — MSMS Annual Scientific Session, Sheraton-Cadillac Hotel, Detroit

Oct. 11-12-13 — University of Michigan Medical Center Alumni Conference, Ann Arbor

Nov. 10 — MSMAS Officers' Workshop, Port Huron Motor Inn, Port Huron

Nov. 11-15 — American Public Health Association Annual Conference, Cobo Hall, Detroit

For more news about Coming Events read the four blue pages in the middle of this issue and every issue of *Michigan Medicine;* and watch for the *News Extra* during the middle of each month.

Two modalities

ultrasound
electrical stimulation
or combination of two
in one console unit

Now Burdick has combined ultrasound and electrical stimulation in a single, attractive console unit, the UT-4300.

Many have found that better results are obtained when ultrasound is combined with electrical stimulation — also used to advantage in **locating trigger-point areas.** Designed for convenience of the operator with controls arranged for easy access, the ultrasound and electrical stimulation modalities may be used individually or in combination. For detailed information call your Burdick dealer, or write us.

THE Cost of AMBAR EXTENTABS IS APPROXIMATELY ONE-HALF THAT OF OTHER LEADING APPETITE SUPPRESSANTS.
AN IMPORTANT FACTOR IN LONG-TERM THERAPY!

CONTROL FOOD AND MOOD ALL DAY LONG WITH A SINGLE MORNING DOSE

AMBAR #2 EXTENTABS®

methamphetamine HCl 15 mg.,
phenobarbital 64.8 mg. (1 gr.)
(Warning: may be habit forming).

One Ambar Extentab before breakfast can help control most patients' appetite for up to 12 hours. Methamphetamine, the appetite suppressant, gently elevates mood and helps overcome dieting frustrations. Phenobarbital, the sedative in Ambar, controls irritability and anxiety... helps maintain a state of mental calm and equanimity. Both work together to ease the tensions that erode the willpower during periods of dieting.

Also available: Ambar #1 Extentabs®—methamphetamine hydrochloride 10 mg., phenobarbital 64.8 mg. (1 gr.) (Warning: may be habit forming).

BRIEF SUMMARY/**Indications:** Ambar suppresses appetite and helps offset emotional reactions to dieting. **Contraindications:** Hypersensitivity to barbiturates or sympathomimetics; patients with advanced renal or hepatic disease. **Precautions:** Administer with caution in the presence of cardiovascular disease or hypertension. **Side Effects:** Nervousness or excitement occasionally noted, but usually infrequent at recommended dosages. Slight drowsiness has been reported rarely. See package insert for further details.

A·H·ROBINS

Mead Johnson-pharmaceuticals created for your specialized clinical needs

She relies on your contraceptive advice

She can expect to continue Oracon for years

ORACON®

16 White—Ethinyl Estradiol, 0.1 mg. Tablets, 5 Pink—Dimethisterone, 25 mg., and Ethinyl Estradiol, 0.1 mg. Tablets

Only 4.4% of patients taking Oracon discontinued it because of side effects

ORACON in a total conception-control program. Generally, withdrawal bleeding is comparable to her usual menstrual flow, even after prolonged use. Incidence of amenorrhea was less than 1% in original studies. Breakthrough bleeding occurred in only 1.5% of full cycles completed, and intractable monilial vaginitis was not reported.

Patients can continue ORACON comfortably. For years. Although a cause and effect relationship has been neither established nor disproved, alertness to the possibility of serious occurrences such as thromboembolism is necessary in any program with any oral contraceptive. Contraindications, medical ramifications, and long-range considerations in the use of ORACON, the same as those for all oral contraceptives, follow.

Mead Johnson also offers these important prerequisites for success in a conception-control program: information for the patient to help her understand conception control; and packaging to guide her in using the product correctly, according to your directions.

to guide you in prescribing ORACON

Indication: Oral contraception.

Effectiveness: Although some pregnancies have occurred while on therapy, oral contraception is the most effective method known.

Mechanism of Action: Gonadotropin suppression.

Contraindications: Thrombophlebitis, history of thrombophlebitis or pulmonary embolism; liver dysfunction or disease; known or suspected carcinoma of breast or genital organs; undiagnosed vaginal bleeding.

Warnings: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia, or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. Since the safety of ORACON in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this to the infant has not been determined.

Precautions: The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. Endocrine and possibly liver function tests may be affected by treatment with ORACON. Therefore, if such tests are abnormal in a patient taking ORACON, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of estrogen-progestogen preparations, pre-existing uterine fibromyomata may increase in size. Because these agents may cause some degree of fluid retention, conditions that might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. ORACON should be used with caution in patients with a history of cerebrovascular accident. In relation to breakthrough bleeding, as in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged ORACON therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving ORACON therapy. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. Because of the effects of estrogens on epiphyseal closure, ORACON should be used judiciously in young patients in whom bone growth is not complete. The age of the patient constitutes no absolute limiting factor, although treatment with ORACON may mask the onset of the climacteric. The pathologist should be advised of ORACON therapy when relevant specimens are submitted.

Side Effects: The following adverse reactions have been

continued on next page

observed in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post-partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression. Although the following have been reported as side effects in users of oral contraceptives, no cause and effect relationship has been established: anovulation post-treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, itching. Post-marketing experience with Oracon has revealed that hypermenorrhea and acne may also occur. The following occurrences have been observed in users of oral contraceptives. A cause and effect relationship has neither been established nor disproved: thrombophlebitis, pulmonary embolism, neuro-ocular lesions. The following laboratory results may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests; coagulation tests (increase in prothrombin, Factors VII, VIII, IX, and X); thyroid function (increase in PBI and butanol extractable protein bound iodine and decrease in T^3 values); metyrapone test; pregnanediol determination.

Administration: Counting onset of menses as Day 1, the patient starts medication on Day 5 of the cycle and takes one white tablet daily from Day 5 through Day 20, then one pink tablet daily from Day 21 through Day 25. Patients should be cautioned to follow the dosage schedule strictly. Evening administration is suggested. An additional contraceptive method is recommended for the first 7 tablet days of the first cycle of Oracon usage. If the regimen is interrupted, for the fullest possible protection an additional contraceptive method is recommended for the rest of the cycle. If flow should not occur by the 7th day after taking the last pink tablet, the next course of therapy should be initiated on that day, thereby allowing 6 full days without medication. Some physicians prefer to stipulate that the patient never allow more than 6 unmedicated days to elapse between cycles regardless of the time of onset of withdrawal bleeding. If two consecutive periods are missed, the possibility of pregnancy should be considered and the patient should report to the physician. However, pregnancy should be suspected at the first missed period if the patient has deviated from instructions. For those few occasions when breakthrough bleeding occurs, the following recommendations are made: (a) Spotting. Continue medication. (b) Menstrual-type flow. Discontinue medication and begin a new medication cycle on the fifth day. Because of the rarity of frank breakthrough bleeding, especially after the first few cycles, it is not necessary to provide the patient with additional tablets to allow for doubling the dose. Recurring breakthrough bleeding, particularly after the first few cycles, should be reported to the physician for further investigation. Because of the common occurrence of increased cervical mucus, it is recommended that the patient be apprised of this possibility.

Availability: Oracon is available as 16 white and 5 pink tablets. Each white tablet contains 0.1 mg. of ethinyl estradiol; each pink tablet contains 25 mg. of dimethisterone and 0.1 mg. of ethinyl estradiol. Each month's supply includes patient instructions. Complete details on Oracon are available from Mead Johnson Laboratories.

to guide her in understanding and using conception control

A discussion of conception control for brides, "To Plan for a Lifetime, Plan with Your Doctor," is one of several booklets available through your Mead Johnson representative or directly from Mead Johnson Laboratories.

The Pakette® dispenser helps prevent patient error by showing her when to start her tablets and when to take every tablet all month long.

Advice Offered at WSU Clinic Day To Help Doctor as Marriage Counselor

BY PETER HOHEISEL
OF THE MSMS STAFF

What can the physician do, and how does he measure up, as a sex and marriage counselor?

What are the special problems in a physician's marriage?

Those were the central questions which the annual Wayne State University School of Medicine alumni program examined recently.

A total of 560 persons, the largest crowd ever, gathered in Detroit May 15 to hear five papers and a panel discussion devoted to "Human Sexuality and Modern Marriage."

SEVERAL SPEAKERS STRESSED that one of the reasons physician's have difficulty with their own sexuality, and in being effective counsellors to their patients, is that sex education in medical school is generally confined to reproductive physiology and sexual anatomy with the result that physicians are not significantly better equipped in terms of sexual attitudes and information than is any comparably educated person.

"Many recent surveys show," Peter A. Martin, M.D., Detroit, said, "that doctors are having trouble with sexual problems—their patients as well as their own. Physicians are improperly trained in medical schools to handle such problems and have trouble getting themselves and their patients to discuss sexual difficulties. It is unlikely that the doctor would be able to go further towards solving his patient's sexual problems than he is able to go with his own."

New president of the WSU Medical Alumni Association James J. Aiuto, M.D., backs this view: "There hasn't been sufficient training at the medical school level. At present only the University of Pennsylvania and Bowman Gray School of Medicine have integrated sex and marriage counselling into their curriculum. These schools also have good postgraduate programs for physicians in this field. Lafayette Clinic, however, is taking some steps in this direction by offering to interested physicians lecture series on this topic."

OUTLINING HOW THE physician can increase his effectiveness as a marriage counsellor was Richard H. Klemer, Ph.D., clinical professor of psychiatry at Bowman Gray School of Medicine.

MARTIN

KLEMER

He cited seven steps which the physician can take to help his patient resolve a marital difficulty:

1. Creating the climate in which the patient can talk about his problems.

2. Providing for the ventilation of emotional catharsis.

3. Providing the reassurance of acceptance of the patient's attitude and perhaps an additional reassurance as well.

4. Diagnosing the real problem with the patient.

5. Encouraging the patient's education and evaluation.

6. Helping the patient to examine all the possible alternatives, and to decide upon a specific action.

7. Motivating the patient toward completing the chosen action.

DOCTOR KLEMER WENT on to discuss three of these steps: Creating the climate, acceptance and reassurance, and motivation.

According to Doctor Klemer, three basic ingredients to creating the climate are:

1. The security given by the confidential attitudes and the physical surroundings in which the counseling takes place.

2. The interest and concern exhibited by the counselor.

3. The non-judgmental attitude of acceptance with which the patient's statements are received by the counselor.

"The non-judgmental attitude of acceptance is especially important," Doctor Klemer said. "This can be achieved only when the counselor has self-understanding of his biases and an ability to tolerate ideas and behavior which conflict with those biases."

"This kind of self-knowledge involves a lot of rigorous self-analysis and often some evaluative help from another professional person," he continued. "Only the physician who is honest with himself can hope to project the necessary attitude of non-emotional objective interest which will ultimately help the patient."

"Another major function of the physician counselor," Doctor Klemer said, "is to provide supportive acceptance and reassurance to the patient. In practical marriage counseling, as in psychotherapy, at least some of the necessary reassurance comes from the quiet acceptance of the patient's attitudes and verbalizations by the counselor. That the counselor is willing to hear such hostile and guilt-ridden thoughts and not pass judgment is often enough for the patient."

"THE FINAL MAJOR FUNCTION of the physician-counselor is to motivate his patient," Doctor Klemer concluded, "to follow through with whatever course of action has been decided upon by the patient after an examination of all the alternatives. This is the point at which the use of some actual direction and persuasion by the counselor not only seems to me to be justified but is also probably inevitable. Very often it is the physician's willingness to reinforce the patient's decision which provides the impetus for the patient to carry his plans through to a successful conclusion."

"Naturally this requires a considerable self-confidence on the part of the counselor himself. An important part of the counselor's ability to help his patient comes from the strength of his conviction of his own ability to help and his willingness to transmit that hopeful belief to that patient. In the end, it is the counselor's personality, his warm self-confidence, which will provide the acceptance, the reassurance, the cooperation and the motivation to help his patient solve his marriage problem."

WHILE IT IS TRUE that, as Harold Lief, M.D., director of the Division of Family Study at the University of Pennsylvania School of Medicine, pointed out, "not necessarily every physician, just as not every teacher, can do a good job in sex education," nevertheless the physician, because of the trust and confidence which the patient places in him, is in a unique position to counsel his patient with sex and marital problems.

THAT THERE ARE special problems in a physician's marriage was attested to in comments by Doctor Martin, clinical professor of psychiatry at both U of M and WSU schools of medicine, when he noted that "Doctor's wives constitute an unusually high percentage of the total number of professional men's wives admitted to the Institute of Living in Hartford, Connecticut."

"There is one marriage pattern which I have seen repeatedly in doctor's marriages," continued Doctor Martin. "The husband is a good, kind, hard-working humanitarian devoted to his mistress-medicine. Everyone thinks how lucky his wife is to be married to such a paragon of virtue. This unassailable position drives his wife to distraction. She over-reacts. She can't attack her husband's good deeds. If only he had a mistress instead of medicine, he could be the bad one and she could be the good one."

"In this pattern, the husband's game is, 'Look how good I am. I am so good and patient to accept such a horribly unappreciative, sick wife. She is bad and unlovable.' The wife's problem is that she doesn't know how to beat this game. She refuses to see him as he is because she is afraid to lose him. She fantasies that he is great and wonderful. She expects him to love her. If he doesn't, she feels she is guilty and unlovable. Her mistake is that she wants him to love her no matter how badly she reacts, no matter how sick she gets. He is so in love with being a long suffering, unappreciated hero he can't afford to break this picture by building her self esteem, recognizing her good points, her contributions, her desire for love and her attractiveness as a sexual object."

After discussing the changing attitudes toward sex in our society, especially the increasing demand for sexual fulfillment on the part of women, Doctor Martin observed that the life of a doctor today "has resulted in difficulty in sharing in the life of his family." He listed several stress points. They were:

One, the doctor is an authority. Perhaps, in part he chose his profession because he likes a position of authority and all sorts of attitudes both rational and irrational are developed towards him.

Two, the doctor is a public figure, is in the limelight, which his family shares in a somewhat different way: while he is subject to adulation as well as criticism, his wife may get a little reflected glory, but is more likely to have her weaknesses or mistakes greatly magnified.

Three, the doctor frequently has a legitimate excuse for being away from home much of the time and for being undependable for social engagements and family occasions.

Four, the doctor has an opportunity for contacts with nurses, patients, secretaries and his wife may well exaggerate his opportunities and explanation of them, because of anxieties relating to her own self-assurance and sense of desirability as a woman.

Goins Reports on Detroit Mother-Child Care Program

About 3500 indigent Detroit mothers have an opportunity for free prenatal, delivery, and post delivery care for themselves and care of their infants up to one year of age through the Detroit Maternity and Infant Care Project.

Currently the DMIC is running clinics in 5 Detroit hospitals which, except one, are near high indigent population areas — Crittenton General, Detroit Memorial, Hutzel, Mount Carmel, and Children's Hospital.

William Goins, M.D., project director, says, "We want to see what can be done to deliver not just maternity but comprehensive care to people whose needs are the greatest."

Not only is the DMIC woman assisted in delivering her baby, but she will also be given instruction on how, when, and what to feed it, as well as how to plan her budget so that she can feed it.

Aim of the project is to treat the indigent mother as a person: To help her use the potentials of her environment in a way which will be healthful to herself and her children.

The DMIC requires no means test for eligibility. "We accept the word of the mother," says Doctor Goins. "Very few people have abused this because if people have the money they generally prefer to go to their own private practice physician.

"Although we have not really made an impact on the high perinatal mortality rate among the poor," Doctor Goins said, "We do feel we are accomplishing our purpose because 90% of the women we help through delivery bring their children back for post delivery care. When the women know they are going to be treated with respect, given adequate time and attention and highly competent medical care, they respond by coming back. The clean wholesome atmosphere where people are kind to them brings the mothers flocking in."

"Compared to city wide statistics among indigent women, we have a very low maternal death rate," Doctor Goins said. "We're getting them in earlier, more often, and we're not losing mothers."

Started in 1964, the DMIC is one of 53 similar projects around the country. Personnel who work at the clinics in the hospitals participating in the project are paid through the project funds. It is funded at about $1 million a year by the Children's Bureau of HEW on a matching basis with the Detroit Health Department. □

Where Does MSMS Stand re Legislation, Forensic Medicine, Laws, Regulations?

Where does MSMS stand on matters of governmental medicine?

That provocative question is one of 13 different subjects covered in a new MSMS workbook "Where Does MSMS Stand?" being studied by members of the MSMS House of Delegates and The Council.

Each of the 13 chapters is discussed, answering the question, in a discussion section, "What is the current thrust of MSMS and how are we doing?" This is followed by a series of questions which need some answers.

The workbook will serve as guidelines for the new Michigan Health Information Research Institute being developed by MSMS.

The November issue of *Michigan Medicine,* on pages 1139 to 1443, gave MSMS members the first information (1) about a new Michigan Health Information Research Institute and (2) about the many ramifications of the "Where We Stand" publication. The publication was developed by MSMS Executive Director Hugh W. Brenneman, who also is responsible for the MSMS Research and Development area.

Various chapters of the book are being printed each month for all MSMS members to study. This month, Chapter Ten is printed in full.

Discussion

Medicare
Medicaid

Governmental medicine has descended upon the physician and has become the focal point of concern. Since the beginning of Medicare in July 1966 and the partial implementation of the State Medical Assistance Program (Medicaid) in the fall of 1966, many problems of major and minor importance have developed for the practicing physician.

Medicare Administrative Burden

Initially, the physicians in Michigan discovered that there was a lack of understanding by the patient about the new laws. Doctors became well versed with the provisions of Medicare and made special purchases of hand books in order to understand and explain the many provisions. While it does now appear that the number of complaints is diminishing, Medicare is still an administrative burden for physicians, hospitals, and clinics in a number of areas.

MSMS Participation in Deliberations on Medicare-Medicaid

MSMS has taken a most active role in meeting many of these problems. Michigan doctors have participated in deliberations of governmental agencies (local, state, and national), voluntary medical insurance companies, hospital organizations, public health and social welfare agencies, and in the State Legislature. This, however, is not to say that problems with Medicare-Medicaid have dissipated. A continuous awareness and concern at all levels is necessary.

Generic Drugs

Food and Drug Administration

In other areas the governmental interest in medical practice has placed present methods in question—e.g., the physician's right to prescribe medicines and drugs in accordance with his best judgment. Some federal legislation and some regulations proposed by the FDA seem on a collision course with the practicing physician by proposing to insist that physicians prescribe by generic name rather than brand names as they have been doing of late.

Comprehensive Health Planning
Heart-Cancer-Stroke

Other governmental programs (PL 89-749, the Comprehensive Health Planning and Public Health Services Amendments of 1966, and PL 89-239, Heart Disease, Cancer, and Stroke Amendments) are receiving much attention and active participation.

Partnership for Health

Briefly, PL 89-749 authorizes funds to states to provide for developing comprehensive statewide, regional, metropolitan and other local area plans for the *coordination of existing and planned health services, including the facilities and persons required for the provision of such services.* HR 6418 is now before the Congress as Partnership for Health Amendments of 1967. It would amend the Public Health Service Act and extend the authorizations for grants in order to broaden and improve authorizations for research and demonstrations relating to the delivery of health services; improve the performance of clinical laboratories; authorize cooperative activities between the Public Health Service hospitals and community facilities.

Health Czar

In actuality, this legislation could be used to set up a potential health czar in Michigan. MSMS has felt that the "czar," if any, should be the Governor himself, particularly if the plans developed included *all* health services, i. e., mental, medical education, aging, etc., etc.

Heart Disease-Cancer-Stroke Amendments

PL 89-239, the Heart Disease, Cancer, and Stroke Amendments of 1967, is designed to encourage and assist in the establishment of regional cooperative arrangements among medical schools and hospitals for research and training and for related demonstrations of patient care in these fields. It is also intended to afford to the medical profession and medical institutions through cooperative arrangements the opportunity to make available to their patients the latest advances and the diagnosis and treatment of these diseases and to improve generally the health manpower and facilities available.

MARMP

MSMS is fortunate in having as vice president of the Michigan Association for Regional Medical Programs, Inc. (MARMP) an active and dedicated physician, Don Marshall, MD, of Kalamazoo.

Federal Grants

Recently, announcement was made of the receipt of the first federal grant of over one million dollars under this program in Michigan, and other applications have been submitted and are awaiting approval from Washington.

Director of Mental Health

Mental Health Budget

Michigan now has a new director of the Department of Mental Health. Mental health in Michigan was one of the programs that had been affected during the period of the inability of the state to settle the problem of fiscal reform. At this date, it is too early to state that the Department will receive its full budgetary needs and requirements, and receipt of tax revenues will largely determine the scope and extent of this Department's activities for the coming year.

Community Mental Health Centers

President Johnson recently signed into law PL 90-31, the Mental Health Amendments of 1967. This law extends for three years the program of matching grants for the construction of community mental health centers and extends for two years the program of matching grants for assisting and defraying the costs of initial staffing. Another item in this act was an amendment of state plans providing that minimum state standards for these community centers must be in effect by July 1, 1969.

Departments of Public Health, Mental Health, Social Services

These items noted above are, presently, the more prominent of the government health programs. They are not by any means the major ones. The Department of Mental Health is largest in terms of money spent, facilities and personnel employed; the Department of Public Health is of greatest importance to the practicing physician because it is closest to him, "touching" him in the hospital, through the county health department, via surveys and statistics, with laboratory services, etc.

The Department of Social Services, with administrative responsibilities in Medicaid and Medicare, as well as through public-owned hospitals, has become a major factor in medical care. The interest of the State Department of Education in rehabilitation relates its work to medicine.

Military Medicine

Military medicine is important and becoming more so. Not only are many military installations located in Michigan, but the Veteran's Administration has major facilities here, and relationships with the military for the care of families of servicemen is a big program growing bigger.

Administrative Code

Final planning on machinery to add a new dimension of program (and service) to MSMS governmental activity by anticipating and helping to mold the rules and regulations of state agencies which will, when published as the Administrative Code, parallel the laws of the state, is under way.

A new subgroup of the Legal Affairs Committee will function within MSMS in a fashion similar to the Joint Legislative Committee on Administrative Rules. An MSMS staff man will have specific responsibility to regularly contact health-related agencies and seek out plans for development of rules and regulations; he will inform the Legal Affairs subgroup of these plans and assist the Society in effectively bringing medicine's thinking to the agencies involved.

When necessary, MSMS will make appearances before the Joint Legislative Committee itself. This activity will require extremely close liaison with the Attorney General Department, the Secretary of State Department, and the Legislative Service Bureau as well as with the several agencies and the Joint Legislative Committee.

We also plan to sharpen our reporting activity with regard to new health laws adopted (or new administrative rules and regulations) by articles in MICHIGAN MEDICINE of an analytical nature — e. g., what do the new laws actually provide? What effect will they have on (1) individual practice, (2) overall quality health care?

Government Importance

The significance of all of the above is simply this: *Government has become the largest and strongest single force in medicine in Michigan.* This is overwhelmingly so if medical education is considered part of "government."

Freedom to Practice Medicine

But to blindly thrash against the bonds that government appears to be fashioning for the profession is not the answer. Quite the contrary, it has the effect of making the bonds stronger and tighter. The only way to maintain the freedom

> ***"Physicians have become increasingly concerned with their need for effective continuing educational opportunities in order that the advances in medical knowledge may be applied in practice with as little delay as possible."***
>
> *—AMA Guide Regarding Objectives and Basic Principles of Continuing Medical Education Programs*

MSMS ANNUAL SESSION, SEPT. 25-26

House of Delegates, Sept. 22-23-24

and dignity of medicine is to be better informed, more alert, and more *unified* than medicine's would-be captors. It should be kept in mind that "government" is not a single unit but is many diverse units, each with separate jealousies, budgets, loyalties, responsibilities, etc. If the medical profession with its clear representation of the major purveyors of health remains unified, flexible, and active, it can call enough decisions so that it can maintain the freedom to practice so essential to its success and to its professional life.

Questions

A. What will be the effect on the medical profession of an increasing percentage of the gross amount spent for medical care being contributed by the governmental sector?

Percentage of Medical Care

B. What will the effect be on private practice when Public Health becomes more involved in medical care and the differences between public health and private health diminish?

Public Health and Private Care

C. How can the effect of Medicare and Medicaid (on the medical care given the people) be evaluated?

Evaluation of Medicare/Medicaid

D. What voids in preventive health exist that might encourage governmental programs to proliferate further?

Voids in Preventive Health?

IMPOTENCE

Android®
(thyroid-androgen) TABLETS

*Effectiveness confirmed by another double blind study**

1. SUMMARY

ANDROID	GOOD TO EXCELLENT 75%
PLACEBO	20%

2. Forty cases reported.
3. Cites synergism between androgen and thyroid.
4. No side effects in patients treated.
5. Alleviation of fatigue noted
6. Case histories on 4 patients.
7. Although psychotherapy still needed, role of chemotherapy cannot be disputed.

*"*Sexual impotence treatment with methyl testosterone – thyroid (ANDROID) a double blind study*" – *Montesano, Evangelista: Clinical Medicine, April 1966.*

CONTRAINDICATIONS—Methyl testosterone is not to be used in malignancy of reproductive organs in male, coronary heart disease. Thyroid is not to be used in heart disease, hypertension unless the metabolic rate is low.

Choice of **4** *strengths*

Android

Each yellow tablet contains:
Methyl Testosterone ..2.5 mg.
Thyroid Ext. (1/6 gr.) ..10 mg.
Clutamic Acid ....50 mg.
Thiamine HCL ....10 mg.
Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-HP
HIGH POTENCY

Each red tablet contains:
Methyl Testosterone ..5.0 mg.
Thyroid Ext. (½ gr.) ...30 mg.
Clutamic Acid ....50 mg.
Thiamine HCL ....10 mg.
Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-X
EXTRA HIGH POTENCY

Each orange tablet contains:
Methyl Testosterone .12.5 mg.
Thyroid Ext. (1 gr.) ... 64 mg.
Glutamic Acid ....50 mg.
Thiamine HCL ....10 mg.
Dose: 1 or 2 tablets daily.
Available:
Bottles of 60, 500.

Android-Plus
WITH HIGH POTENCY
B-COMPLEX AND VITAMIN C

Each white tablet contains:
Methyl Testosterone ..2.5 mg.
Thyroid Ext. (¼ gr.) ...15 mg.
Ascorbic Acid (Vit. C) .250 mg.
Thiamine HCL ....25 mg.
Clutamic Acid ....100 mg.
Pyridoxine HCL ....5 mg.
Niacinamide ....75 mg.
Calcium Pantothenate .10 mg.
Vitamin B-12 ....2.5 mcg.
Riboflavin ....5 mg.
Dose: 2 tablet twice daily.
Available: Bottles of 60, 500.

also available with ESTROGEN
Android-E
Each Tablet Contains:
Methyl Testosterone ..... 2.5 mg.
Ethinyl Estradiol .... 0.02 mg.
Thyroid Ext. (1/6 gr.) ..... 10 mg.
Thiamine Hydrochloride .... 10 mg
Glutamic Acid .... 50 mg

INDICATIONS: Advantage is taken of the anabolic action of ANDROID without its virilizing effect Estrogen balances the androgen—only steroid effect remains Geriatrics, post operative and debilitating disease, osteoporosis **DOSE**: One tablet t.i.d. Female patients should have a rest period 5 to 7 days after 21 days of medication. **SIDE EFFECTS**: In the female, excessive dosage may produce virilizing effects of most androgens hoarseness, hirsutism, enlarged clitoris Symptoms can be avoided by keeping the dosage below 300 mg of testosterone per month **CONTRA-INDICATIONS**: See Android Ethinyl estradiol is not to be used in latent malignancy of reproductive organs or mammary glands.

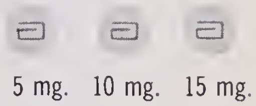
An anorectic will help her lose weight–
but can she keep it off?
You need more than a pill
(even ours) to do that!

That's why Abbott offers you a pill plus a program.

The Product

For smooth appetite control plus mood elevation

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form



For patients who can't take plain amphetamine

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

The Program

Weight Control Booklet

Specifically written to help your patients understand why they are overweight, and what they can do about it. The booklet stresses the importance of *changing lifelong eating habits* and explains how this can be done, sensibly, comfortably—and permanently. There is, also, a comprehensive list of foods showing their caloric content.

the secret of controlling your weight

Food Diary

Designed to help the overweight patient follow your eating instructions. Space is provided for breakfast, lunch, supper, and even snacks. By writing down everything that's eaten each day, the patient is constantly reminded that she's trying to change her eating habits. And you are furnished with a written record of how well she's doing.

Picture Menu Booklet

A large (10″ x 10″) booklet which features appetizing lunch and dinner menus for every day of the week. The meals are depicted in full color and the correct portion size so that the dieter can see the amount of food that's recommended. Patients are pleasantly surprised to learn that each day's meals add up to only 1,000 calories.

Ask Your Abbott Man For Free Supplies

Brief Summary

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

Indications: Desoxyn and Desbutal are used orally as appetite suppressants, for reduction of mild mental depression, and to help in management of psychosomatic complaints or neuroses. Desoxyn, when administered parenterally, may be used as a vasopressor agent or analeptic.

Contraindications: Methamphetamine (in Desoxyn and Desbutal) is contraindicated in patients taking a monoamine oxidase inhibitor. Do not use pentobarbital (in Desbutal) in persons hypersensitive to barbiturates.

Precautions, Side Effects: Observe caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs. Prolonged usage may lead to tolerance or psychic dependence. Careful supervision is necessary to avoid chronic intoxication and drug dependence.

Amphetamine side effects such as headache, excitement, agitation, palpitation or cardiac arrhythmia usually may be controlled by reducing the dose. Paradoxically-induced depression is an indication to withdraw the drug. Pentobarbital (in Desbutal) may cause skin rash. Nervousness or excessive sedation with Desbutal is often transient.

Install Pollard to Lead College of Physicians

The 49th Annual Session of the American College of Physicians saw H. Marvin Pollard, M.D., Ann Arbor, installed as national president at the close of the scientific sessions at the War Memorial Auditorium in Boston.

Doctor Pollard, professor of internal medicine at the University of Michigan, heads the gastroenterology section at the U-M Medical Center. He was graduated from the U-M Medical School in 1931 and has been a member of the U-M faculty throughout his career.

He was active in the establishment of postgraduate education programs by the American College of Physicians in South America in 1963. In addition to his activities in the ACP, he serves as treasurer of the Organization of Gastroenterology and as director-at-large of the American Cancer Society.

ELECT CLAPPER TO SERVE ON BOARD FOR ACP

Muir Clapper, M.D., Detroit, Professor of Medicine at Wayne State University School of Medicine, has been elected to a three-year term on the Board of Governors of the American College of Physicians. Elections were held at the College's 49th Annual Session, recently in Boston.

WJBK-TV FILMS QUIZ

Herbert A. Raskin, M.D., of Detroit, one of the speakers at the recent MSMS Health Planning Conference, is shown here being interveiwed by Sylvia Wayne, of WJBK-TV, Channel 2 in Detroit, during the Conference. Doctor Raskin discussed Michigan state laws as they relate to problems of alcoholism and drug addiction.

retic activity throughout the day.
l one-a-day dosage, in the
g run, means few tablets to take
 few tablets to pay for.

Hygroton, brand of chlorthalidone, may mean troublesome side effects for certain patients. And you can't prescribe it in cases of demonstrated hypersensitivity to the drug or in severe renal or hepatic diseases.

Before writing it for your patients, please check the Prescribing Information. It's summarized on the next page.

lygroton

lorthalidone in edema and hypertension

Geigy

in edema and hypertension

A little Hygroton® can work a long day

chlorthalidone

Indications: Hypertension and many types of edema involving retention of salt and water.

Contraindications: Hypersensitivity and most cases of severe renal or hepatic disease.

Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.

Use with caution in pregnant patients. Since the drug may cross the placental barrier, adverse reactions which may occur in the adult (thrombocytopenia, hyperbilirubinemia, altered carbohydrate metabolism, etc.) are potential problems in the newborn.

Precautions: Antihypertensive therapy with this drug should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents or other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Barbiturates, narcotics or alcohol may potentiate hypotension. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated.

Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, the drug should be discontinued and potassium supplements given, provided the patient does not have marked oliguria.

Take special care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended.

Adverse Reactions: Nausea, gastric irritation, vomiting, anorexia, constipation and cramping, dizziness, weakness, restlessness, hyperglycemia, hyperuricemia, headache, muscle cramps, orthostatic hypotension, aplastic anemia, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin rashes, urticaria, purpura, necrotizing angiitis, acute gout, and pancre titis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reac tions reported with this class of compounds include: jaundice, xanthopsia, paresthesia, and photosensitization.

Average Dosage: 50 or 100 mg. with breakfast daily or 100 mg. every other day.

Availability: White, single-scored tablets of 100 mg. and aqua tablets of 50 mg., in bottles of 100 and 1000.

New

Tegretol®
carbamazepine

Therapeutic breakthrough in non-narcotic control of the pain of trigeminal neuralgia

Warning
Fatal cases of aplastic anemia have been reported following treatment with Tegretol. Agranulocytosis, thrombocytopenia and transitory leukopenia have also been observed.
Complete blood and platelet counts should be done prior to and at regular intervals during treatment with the drug (see recommendations under "Important Note and Precautions") to help in the early detection of serious bone marrow injury. Abnormalities in initial blood tests should rule out use of the drug. Also, patients should be made aware of such early toxic signs of a potential hematologic problem as fever, sore throat, mouth ulcers, easy bruising and petechial or purpuric hemorrhage. Should such signs appear, the patient should be advised to discontinue the drug and to report to the physician immediately.

Indication Tegretol is indicated in the treatment of the pain associated with true trigeminal neuralgia. It is not a simple analgesic and should never be administered for relief of trivial facial aches or pains.
Contraindication Do not use in those with a known sensitivity to any tricyclic compound or in those being treated with M.A.O.I. agents. As long a period as possible should elapse before using Tegretol in patients who have been treated with M.A.O.I.'s, with a minimum of 7 days. In such cases, initial dosage should be low and the patient's reaction to gradual increments closely observed.
Important Note and Precautions Familiarity with the clinical symptoms which lead to an accurate diagnosis of true trigeminal neuralgia and with the complete prescribing information, careful patient selection, a thorough examination before treatment and close patient supervision throughout the treatment period are essential to the safe and effective use of this drug.
Where feasible, Tegretol should not be used in conjunction with any potent drug which may increase the possibility of toxic reactions.
In pregnancy, the drug should not be prescribed during the first trimester and thereafter only to patients in whom the clinical situation warrants the potential risk. It should not be administered to nursing mothers.
Patients with increased intraocular pressure should be closely observed during treatment with this drug because of its anticholinergic effect.
Because of the drug's relationship to other tricyclic compounds, the possibility of activation of latent psychosis and, in the elderly, of confusion or agitation, should be considered.
Dizziness and drowsiness may occur and patients should be cautioned about the hazards of operating machinery or automobiles and of engaging in other hazardous tasks.
Use cautiously in patients with a history of coronary artery disease, organic heart disease, congestive failure or liver disease.
Before initiating therapy, the following laboratory procedures should be performed:
1. Complete blood and platelet counts which, if abnormal, should rule out the use of the drug.
2. Baseline evaluations of liver function.
During treatment with Tegretol, the following laboratory procedures should be performed:
1. Complete blood and platelet counts should be done at intervals of one week during the first month of drug treatment, every two weeks during the second and third months, and at monthly intervals thereafter for as long as the patient is taking the drug. A trend toward a decreasing white blood cell count should suggest a dosage reduction and more frequent laboratory and clinical evaluations. Should this trend continue, the drug should be discontinued.
2. Liver function tests must be performed at regular intervals during treatment with this drug since liver damage may occur during therapy. The drug should be discontinued immediately in cases of aggravated liver dysfunction or active liver disease.
3. Periodic eye examinations, including slit-lamp, funduscopy and tonometry, are recommended for patients being treated with this drug since many phenothiazines and related drugs have been shown to cause eye changes.
4. Complete urinalysis and BUN should be done on patients treated with Tegretol because of observed renal dysfunction.
Adverse Reactions Dizziness, drowsiness, unsteadiness on the feet, nausea, vomiting, aplastic anemia, transitory leukopenia, agranulocytosis, eosinophilia, leukocytosis, thrombocytopenia, purpura, abnormalities in liver function tests, cholestatic and hepatocellular jaundice, urinary frequency, acute urinary retention, oliguria with elevated blood pressure, albuminuria, glycosuria, elevated BUN, microscopic deposits in the urine, impotence, disturbances of coordination, confusion, headache, fatigue, blurred vision, transient diplopia and oculomotor disturbances, speech disturbances, abnormal involuntary movements, peripheral neuritis and paresthesias, depression with agitation, talkativeness, nystagmus, tinnitus, paralysis and other symptoms of cerebral arterial insufficiency, pruritic and erythematous rashes, urticaria, Stevens-Johnson syndrome, photosensitivity reactions, alterations in skin pigmentation, exfoliative dermatitis, alopecia, diaphoresis, recurrence of thrombophlebitis, erythem multiforme and nodosum, aggravation of disseminated lupus erythematosus, gastric distress, abdominal pain, diarrhea, constipation, anorexia, dryness of the mouth and pharynx, glossitis, stomatitis, fever, chills, adenopathy, lymphadenopathy, aching joints and muscles, leg cramps, conjunctivitis, left ventricular failure, aggravation of hypertension, hypotension, syncope and collapse, edema, aggravation of coronary artery disease and congestive heart failure. (Whether these cardiovascular effect are drug-related is not known. However, some of these complications hav resulted in fatalities.) The necessity for discontinuing the drug should be dictated by the gravity and severity of the adverse reactions.
Dosage and Administration The drug should always be taken with meals, if possible.
Initial: One-half tablet (100 mg.) b.i.d. on the first day. Thereafter, the dose should be increased in one-half tablet (100 mg.) increments every 12 hour until freedom from pain is achieved. To relieve pain, between 200 mg. and 1200 mg. per 24 hours may be necessary.
Maintenance: Initial control of pain can be maintained in most patients with a dose of 400 mg. to 800 mg. daily. Maintenance doses may range between 200 mg. and 1200 mg. daily.
At least once every 3 months during treatment period attempts should be made to discontinue the drug or to reduce the dose to the minimum effective level.
Availability Round, white, single-scored tablets of 200 mg. in bottles of 100 and 1000. (B)46-820-A

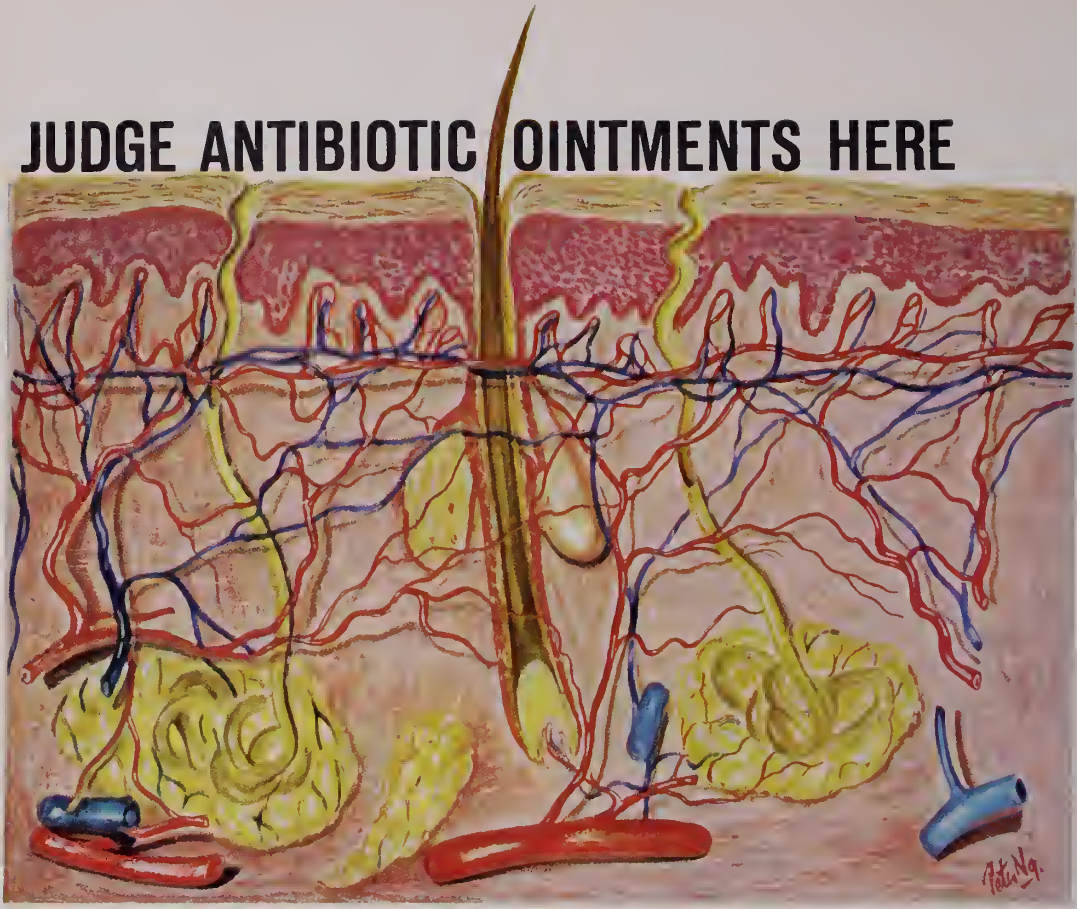
JUDGE ANTIBIOTIC OINTMENTS HERE



Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B —bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.
Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.
Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.
Complete literature available on request from Professional Services Dept. PML.

State Reports Year Of PKU Testing

BY MICHIGAN DEPARTMENT OF PUBLIC HEALTH

During the 1967 phenylketonuria testing program, the total number of Guthrie tests performed on newborns in 204 hospitals in Michigan was 157,583. The total number of births in Michigan during 1967 was 161,637. There was a total of 107 presumptive positive tests. Thirteen newborn infants with PKU were identified, bringing the incidence rate for Michigan in 1967 to one in approximately 12,000 live births.

The relatively large number of presumptive positive tests is worthy of mention. Most of them occured in infants of low birth weight, particularly infants receiving high protein feedings. A number of infants who initially presented low grade but persistent elevations of blood phenylalanine, on the other hand, eventually had the diagnosis of atypical or "mild" PKU confirmed. For this reason, all infants with presumptive positive tests received very careful follow-up.

David W. Knox, M.D., left, intern at Midland Hospital, received a $1,000 Mead Johnson award for Graduate Training in General Practice during the Annual MSMS Spring Clinic in Midland. Presentation was made by Lee Feldkamp, M.D., right, Plymouth, president of the Michigan Academy of General Practice. Doctor Knox received his M.D. degree from Ohio State University College of Medicine in 1967 and is now completing his first year of family practice training in Midland Hospital's program. The scholarship award is one of 12 granted annually by the American Academy of General Practice under a grant from Mead Johnson Laboratories. Charles A. Sanislow, M.D., seated center, Midland, was chairman of the day. A. Carl Stander, M.D., MSMS councilor, and Robert E. Bowsher, M.D., Director of Medical Education at Midland Hospital, assisted with the arrangements for the MSMS postgraduate educational program.

PKU DIET BOOKLET REVISED

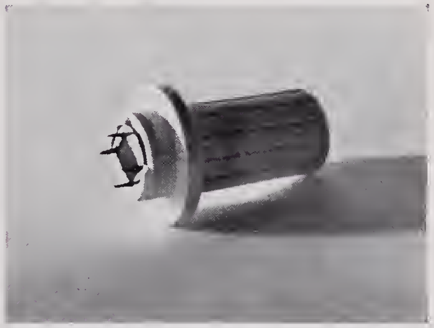
A revised edition of the booklet "The Low Phenylalanine Diet" is now available. This revision replaces the two previous publications "The Low Phenylalanine Diet — for Professional Use" and "A Diet Guide for Parents of Children with PKU." It is printed with a washable plastic cover and is spiral bound so that it may be used by the mother while actually preparing food in the kitchen. It has been developed by the Nutrition Section, Michigan Department of Public Health, with the cooperation of other institutions, agencies, and commercial companies.

The booklet has been prepared as a working guide for the parent, and includes information of the disease, and the steps involved in planning the diet according to the physicians prescription. More emphasis is placed in this booklet on the diet of the newly-diagnosed *infant* along with guidance for the parent in making the transition in feeding from infancy to toddler stage.

Copies of this booklet are available free within the State of Michigan and may be requested from the Nutrition Section, Michigan Department of Public Health, Lansing, Michigan 48914.

To fight TB-find it first!

Make tuberculin testing routine with every physical examination.



TUBERCULIN, TINE TEST
(Rosenthal)

Side effects are possible but rare: vesiculation, ulceration, or necrosis at test site. Contraindications: none, but use with caution in active tuberculosis. Available in 5's and 25's.

ACTIVITIES, PROJECTS

DOCTORS, WIVES FURNISH KIMBALL MUSEUM ROOM

The Woman's Auxiliary to the Calhoun County Medical Society is furnishing the Medical Room of the historic Kimball House Museum in Battle Creek.

Originally belonging to the late Arthur Kimball, M.D., the house was given to the Junior League of Battle Creek for development as a museum.

The Calhoun County Medical Society has donated $900.00 to the Woman's Auxiliary to paint and furnish the Medical Room.

Francis L. Lam, M.D., president of the Calhoun County Medical Society, reports that the equipment in the room dates back to about 1870. It includues an examining table, surgical instruments, an antique rocker, and a microscope.

"One of the interesting items," Doctor Lam said, "is an old doctor's ledger. It contains reference to physician's fees being paid with a cord of wood or two chickens." ☐

US SURVEY POINTS TO DANGERS OF SMOKING

The new U.S. Public Health Survey of smoking-health has reported the following findings about the harmful effects of smoking:

Members of the nation's labor force who smoke cigarettes spend some 33 per cent more time away from work because of illness than do persons who have never smoked.

Women who smoke cigarettes, including both housewives and those who work outside the home, spend 17 per cent more days ill in bed than women who have never smoked.

In addition, people who smoke have more days in which they have to cut down on their usual activities because of illness.

The relationship between smoking and illness is particularly strong for such diseases as chronic bronchitis, cardiovascular disease, and peptic ulcers. What has long been known about the relationship between smoking and death from these diseases is now shown to be true of illness and disability as well. ☐

Jaycees Sponsor Many Local Health Projects

Through their continuing concern for Community Development, Michigan Jaycees have been active in various health issues around the state. VD education, measles innoculation, and fluoridation — these are just a few of the areas in which this dynamic group has been involved.

The Livonia Jaycees launched a measles innoculation program. The Wayne County Medical Society helped by providing a doctor, two nurses, and two technicians. American Red Cross provided clerical help and Bank of Detroit supplied a teller to handle donations.

The Fremont Jaycees, with the help of the Newaygo County Medical Society and the county dental association and other groups, got the public support necessary for the City Commission to approve fluoridation of city water.

The Fowler Jaycees piloted a VD education project in Clinton County by presenting 28 programs to various community organizations thereby awakening the public to the need for VD education among young people and teen-agers.

Mount Clemens Jaycees are taking leadership in Project Showboat. Aim of this program is to raise $112,000 to buy a houseboat and convert it to a small floating clinic for use on the Mekong River in Southeast Asia by the Thomas A. Dooley Foundation. The clinic will help local people establish their own basic care centers. ☐

OAKWOOD DIRECTOR CITED

Neil McGinniss, director of Oakwood Hospital, Dearborn, recently received the Key Award, highest honor conferred by the Tri-State Hospital Assembly, during the annual meeting in Chicago. Mr. McGinniss, a past president of the Michigan Hospital Association, is in his eleventh year as director of Oakwood Hospital. ☐

How About Anti-Smoking Poster for Office Display?

An excellent poster which reads "1,000 Doctors Have Quit Smoking Cigarettes (maybe they know something you don't)" has been issued recently by the National Clearinghouse on Smoking and Health.

Any physician who would like to receive one, or a supply of them, can get them from MSMS headquarters, P.O. Box 152, East Lansing. ☐

WSU MAN SELECTED AS MARKLE SCHOLAR

Robert F. Wilson, M.D., assistant professor of surgery at Wayne State University School of Medicine, has been named a Markle Scholar by the Markle Foundation in New York. To promote his professional development, Doctor Wilson will receive a $30,000 grant over a five-year period.

Doctor Wilson received his medical degree from Temple University, and has served on the Wayne faculty since 1963. His research has been in the basic mechanisms of shock and other metabolic derangements in humans. ☐

One of the sidelights to the 1968 WSU Medical School Alumni Clinic Day in Detroit recently was a special art exhibit composed of work by alumni physicians and their wives. Discussing one of his works with Mary Sylvester, a reporter from the Royal Oak Daily Tribune, is Joseph R. Montante, M.D., of Orchard Lake. Thirty physicians and their spouses contributed 70 pieces of art. The show was coordinated and hung by David Jacknow, M.D., of Huntington Woods.

Diarrhea

TROCINATE® 400 MG.

BRAND THIPHENAMIL HCl.

The relief received from the first Trocinate 400 mg. tablet is so prompt that the discomfort of diarrhea ceases to be a bother. May be repeated every four hours.

Upon request, a supply of Trocinate 400 mg. with literature will be sent to physicians for their personal use.

PUBLIC RELATIONS

Counties Invited to Join Community Health Week

BY BROCK E. BRUSH, M.D., CHAIRMAN
MSMS COMMITTEE ON PUBLIC RELATIONS

Every component medical society in Michigan is encouraged to join the MSMS observance of the 1968 Community Health Week, October 20-26.

Three timely themes — drug abuse, physical fitness and health careers — have been selected by the AMA for this sixth annual observance of Community Health Week across the nation. Community Health Week is a public service program inaugurated by the AMA's House of Delegates in 1962.

Goals of the observance are for state and county medical societies, in cooperation with other members of the community health team, to present meaningful programs aimed at furthering public awareness of the wide variety of health services and facilities existing at the community level, to call attention to present health problems and potential solutions, and to call attention to continuing medical advances.

Your MSMS Committee on Public Relations will propose possible county-level projects, and offer advice and guidance. ☐

Urges Better Evaluation Of Health Messages

BY PETER HOHEISEL
OF THE MSMS STAFF

"What is often called evaluation of health education is only a description of activity rather than outcomes," said a University of Michigan psychologist at a panel on "Psychological Influences on Health Behavior" during the AMA's recent 3rd National Conference on Health Education of the Public in Chicago.

Speaking on "Health Education Research Relating to Health Behavior," James W. Swinehart, Ph.D., a research associate and lecturer in the U-M School of Public Health, noted three basic needs in health education today: (1) To reduce the discrepancy between belief and behavior, (2) To obtain and use more information on audience characteristics when planning health education programs, and (3) To do more and better evaluation of health education efforts.

Doctor Swinehart described the process through which a health education message is transmuted from information to action as six basic steps: Distribution, Exposure, Attention, Learning, Acceptance, and Action.

"If there is a gap between any of the six steps," Doctor Swinehart explains, "the desired action may not take place. A person could go through the first five without taking the last and most important step to action."

"There has been an assumption on the part of health educators and physicians that if you give people information they will act rationally on it," he continued.

"Several studies have shown that this is not the case," the University of Michigan Psychologist said.

Doctor Swinehart cited a study of policemen in California as to whether or not they use seat belts when driving their own automobiles. The assumption would be that as a segment of the population they would have a higher consciousness of the importance of the seat belt since they see the results of accidents when people are not wearing them and since they are required to wear them in their own patrol cars. The study, however, did not show any higher incidence of the use of seat belts among policemen.

To close the gap between information and action, Doctor Swinehart recommends more detailed research into the specific characteristics of the audience which is to be reached with a health message.

He recommends that health educators find out "What kind of worries do people have about specific diseases. Is it the pain? The cost of treatment? The attitudes of other people toward the disease?"

"Once these and other matters are determined with some precision," Doctor Swinehart said, "A message can be tailored to a specific audience segment, and, in my opinion, be much more effective. If we can get a better idea of who the audience is, we can know more definitely that the 6 steps will take place." ☐

DID YOU KNOW THAT

"Would-be doctors entering medical school this fall may be astonished to learn that 80 per cent of the medical practice they will be taught was discovered since most of them were born."

BROWN SPIDER MOVING NORTH; SYMPTOMS ARE EXPLAINED

(Note: The following are excerpts from a National Clearinghouse for Poison Control Centers Bulletin distributed in Michigan by the Division of Epidemiology, Michigan Department of Public Health.)

Although the brown spider has been recognized to exist in most parts of Oklahoma, Kansas, Arkansas, Texas, Louisiana, Mississippi, Alabama and Tennessee, reported activities would indicate a northward migration of the species.

A three-year-old boy living in Pocahontas, Illinois died two days after having been bitten by a spider in bed; a *Loxosceles reclusa* was found in the home.

The brown spider varies from $\frac{3}{10}$ to $\frac{1}{2}$ inch in body length and is yellowish to dark brown in color. This spider is distinguished by the presence of three pairs of eyes arranged in a semi-circle on the fore part of the head and a violin-shaped dark marking on the cephalothorax immediately behind the semi-circle of the eyes.

The spider is usually found in dark spaces and its irregular webs are spun near cracks in foundations and in or around steps, containers, or hanging clothes. The spider is not considered to be aggressive and most bites have occurred when spiders were trapped beneath clothing or bedding.

The systemic symptoms are fever, restlessness, albuminuria and generalized pruritic rash (scarlitiniform) over the entire body. The toxin has been shown both experimentally and clinically to produce acute hemolytic anemia with hemoglobinuria and hematuria. Jaundice occurs in about 33% of the patients. The systemic effects may last up to five days and may result in the patient's death. The local reaction is of inflammation discoloration, echymosis, necrosis, and tissue sloughing which may persist for several weeks. A local reaction is the most common and, except for its prolongation, is usually relatively benign. The treatment is symptomatic and supportivve, but steroids and antihistomines may be of value.

Useful references on the subject of the *Loxosceles reclusa* are: James et al, Am. J. Dis. of Child., Sept. 1961, pp. 145-148; JAMA, 185-11, Sept. 1963, Arachnidism in the United States, pp. 839-843; Schreiner, G. F. and Maher, J. F., Toxic Nephropathy, Am. J. of Med., 38:438, March 1965; Nation Pest Control Association—Technical release No. 11-64, June 24, 1964, No. 11-58, June 17, 1958.

Florida, Michigan Lead Nation in Growth In Personal Income

Herbert C. Dejonge, Director, Department of Commerce of the State of Michigan, made the following observations about Michigan's economic health in his article "Michigan Expanding Economy" which appeared in a recent issue of *Michigan Challenge*.

So far in the decade of the 60's Michigan ranks second among the largest states in percentage growth for total personal income.

Since 1962, Gross State Product — the total output of goods and services — jumped 50.6% while gross national product is up 40.2%. Nonfarm employment in the State climbed from 2,672,000 to 3,168,000 or 18.6%; the U.S. average gain was 13.9%.

Since 1963, retail sales in Michigan have jumped 33.6%, versus a rise of 27.1% for all states.

THE 10 LEADING STATES IN TERMS OF INCREASE IN PERSONAL INCOME
(in millions of dollars)

	1960	1966	Change	% Increase
Florida	9,746	15,410	5,664	58.1
Michigan	18,203	27,685	9,482	52.0
California	42,980	65,002	22,022	51.2

Auxiliaries Collect Drugs, Supplies for Overseas

BY MRS. W. G. GAMBLE, JR., PRESIDENT
WOMAN'S AUXILIARY TO MSMS

International Health Activities is a most important Auxiliary program, for it is dedicated to helping the less fortunate persons of our own and other nations. Through our national, state, and local International Health Activities committees, we are attempting to ease the critical shortage of medical supplies throughout the world.

Our method is simple — the Auxiliary at the county level collects unused supplies and sends them to a proper distribution agency (one that is certified by the U.S. Food and Drug Administration) for shipment to foreign countries. In Michigan the supplies go to World Medical Relief, a certified agency whose headquarters are in Detroit.

WHAT DO WE COLLECT?

Pharmaceutical samples are a major item for collection. However, they must be in perfect condition and up-to-date. A registered pharmacist at World Medical Relief checks all medications before they are distributed to foreign recipients.

Another commodity we collect is medical textbooks which must be at least four years current. Medical and surgical supplies, treadle sewing machines, prostheses of every description, medical journals, used radio equipment for physicians in remote areas, eye glasses (both lenses and frames, and not necessarily together) are all valuable materials which are needed in underprivileged areas here and abroad.

But not only do we collect items such as the ones listed above — we also make useful articles. For instance, if you attended a meeting of the Auxiliary in your county, you would see many members knitting seemingly endless, three-inch or one-inch-wide bands. These knitted bands, after being carefully washed, dried, and wrapped in plastic, become leper bandages. Other bandages are made from old sheeting or pillow cases.

Johnny Coats are another Auxiliary-produced article. They are made from old shirts and are used for hospital gowns by needy persons all over the world.

HOW LARGE AN EFFORT is this project for international health? Some statistics answer the question: In 1966-67 the Auxiliary to the MSMS sent 15,337 pounds of drugs and many large pieces of equipment to World Medical Relief. In addition, approximately 1000 pounds of materials were sent to World Vision. This year's poundage is even more impressive. Over 30,000 pounds of medical supplies have been collected thus far, this year, for the International Health Activities program. Of course this does not include approximately $500 that has been donated to the cause of international health.

This year's state chairman for IHA is Mrs. R. F. Hauer of Fowlerville. Mrs. Hauer joins me in requesting that you physicians continue helping us, by contributing surplus supplies, to help others.

In this way we can all show our concern for our less fortunate neighbors.

APHA Convention In Detroit to Focus On Urban Questions

The urban health crisis and health planning are two of the major items the 96th annual meeting of the American Public Health Association will study at its November 11-15 meeting at Cobo Hall in Detroit.

Current APHA president and chairman of the local committee for the annual meeting is John J. Hanlon, M.D., Detroit and Wayne County Director of Public Health.

Breathalyzer Effective In Michigan

BY ELMER WHITE, EXECUTIVE DIRECTOR, MICHIGAN PRESS ASSOCIATION

The old slogan, "If you drink, don't drive," may soon be obsolete as Breathalyzers become more common in Michigan. The new slogan seems to be, "If you drink and drive, be prepared to walk."

Arrests for drunk driving increased 78 percent the first four months of 1968 over 1967, Michigan State Police report. Law enforcement agencies throughout the state, from January through April, asked 5,151 drivers to take the test. Seventy-six percent of those tested exceeded the presumptive level of intoxication, and 12% were in the "impaired driving" bracket. Police said 1,214 drivers refused to take the test.

Under Michigan's "Implied Consent Law," refusal is cause for suspension of an operator's license. Secretary of State James M. Hare reports that 1,236 drivers cited for refusing to take the chemical test, 631 persons appealed the license suspension. Licenses were restored, after hearings, in 95 cases and denied in 524; 12 cases were awaiting hearing dates.

There are now 850 Breathalyzer operators in the state, and another 100 will be trained before the current school is completed, State Police say. Instruments have been placed in 40 sheriff offices, 39 city police departments, three township police departments and 59 State Police posts. Forty-seven more will be installed in the near future.

IN MEMORIAM

R. M. Cooley, M.D., Jackson

Randall M. Cooley, M.D., Jackson radiologist, died May 20. He was 81. Doctor Cooley was a Life Member of MSMS and a Past President of the Jackson County Medical Society. He was affiliated with Mercy Hospital, Jackson.

His premedical studies were done at Kalamazoo College and he was graduated from the University of Michigan Medical School in 1910. He served at the 125th Field Hospital during World War I.

He was president of the Detroit Roentgen Ray and Radium Society in 1956 and was a member of the Radiological Society of North America and the American College of Radiology.

H. F. Dibble, M.D., Detroit

Harry F. Dibble, M.D., Detroit, a delegate to the MSMS House of Delegates from Wayne County for many years, died May 10. He was 79.

Doctor Dibble was a member of the House of Delegates between 1920 and 1950 and served several years on the MSMS News Committee at the Annual Sessions when held in Detroit. He held a teaching appointment in general surgery at Wayne State University from 1921 to 1950.

He was graduated from the Detroit College of Medicine in 1911 and served his internship and residency at Harper Hospital. He was affiliated with Harper and Receiving hospitals until his retirement.

During World War I, he served briefly with the Royal Army Medical Corps and as a Captain in the Medical Corps of the U. S. Army, Base Hospital, France.

Doctor Dibble was a Fellow of the American College of Surgeons, a Life Member of MSMS, and a member of the Academy of Surgery and the Detroit Surgical Society. His medical fraternity was Nu Sigma Nu.

N. H. Goldberg, M.D., Detroit

Nathan H. Goldberg, M.D., Detroit physician, died May 4 at the age of 76.

Doctor Goldberg was graduated from the Vanderbilt University School of Medicine in 1916.

He had practiced in Detroit for the past 35 years, specializing particularly in urology, syphilology, dermatology and surgery. He was affiliated with Wayne County General Hospital.

He was a Life Member of MSMS and a member of Pi Mu medical fraternity.

Joseph Hickey, M.D., Dearborn

Joseph Hickey, M.D., Dearborn general practitioner, died April 12 at the age of 71.

Several times a delegate from Wayne County to the MSMS House of Delegates, Doctor Hickey was a Life Member of MSMS.

He received the M.D. degree from Wayne State University in 1929 and did his residency and internship at Receiving Hospital, Detroit. He served as chief of staff at Oakwood Hospital, Dearborn, from 1954-56 and was also affiliated with Delray General Hospital, Mt. Carmel Mercy and Wyandotte hospitals.

Doctor Hickey was an Associate Fellow of the International College of Surgeons and a member of the American Academy of General Practice and Phi Beta Pi medical fraternity.

G. W. Stewart, Jr., M.D., Saginaw

George W. Stewart, Jr., M.D., Saginaw general practitioner, died May 13 at the age of 58.

Doctor Stewart began practice in Saginaw in 1941 after two years in Owosso. At various times he served as president, vice-president and secretary of the Senior Staff at St. Lukes Hospital in Saginaw. He was also affiliated with St. Mary's Hospital and Saginaw General Hospital.

He received the B.A. degree from the University of Detroit and was graduated from the University of Michigan Medical School in 1937. For four years during World War II he served in the Army Medical Corps and was awarded two Battle Stars for action in the Pacific Theatre.

Doctor Stewart was president of the Saginaw Academy of General Practice in 1953.

SERVICE TO HANDICAPPED, TRIBUTE TO ALMA DOCTOR

A sheltered workshop program for the Central Michigan area soon to be inaugurated in Alma will be a living memorial to the late C. L. Hoogerland, M.D., an Alma physician and pediatrician who died a few years ago. To be known as the C. L. Hoogerland Memorial Workshop, the project will assist the physically, emotionally, and mentally handicapped by providing training and an opportunity to work under sheltered conditions. It will also help to find employment for those who may be able to leave the workshop to accept full-time employment in the community.

Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® tablets in two different formulations.

And let you control the dosage.

NOVAHISTINE LP
NOVAHISTINE SINGLET
PITMAN-MOORE

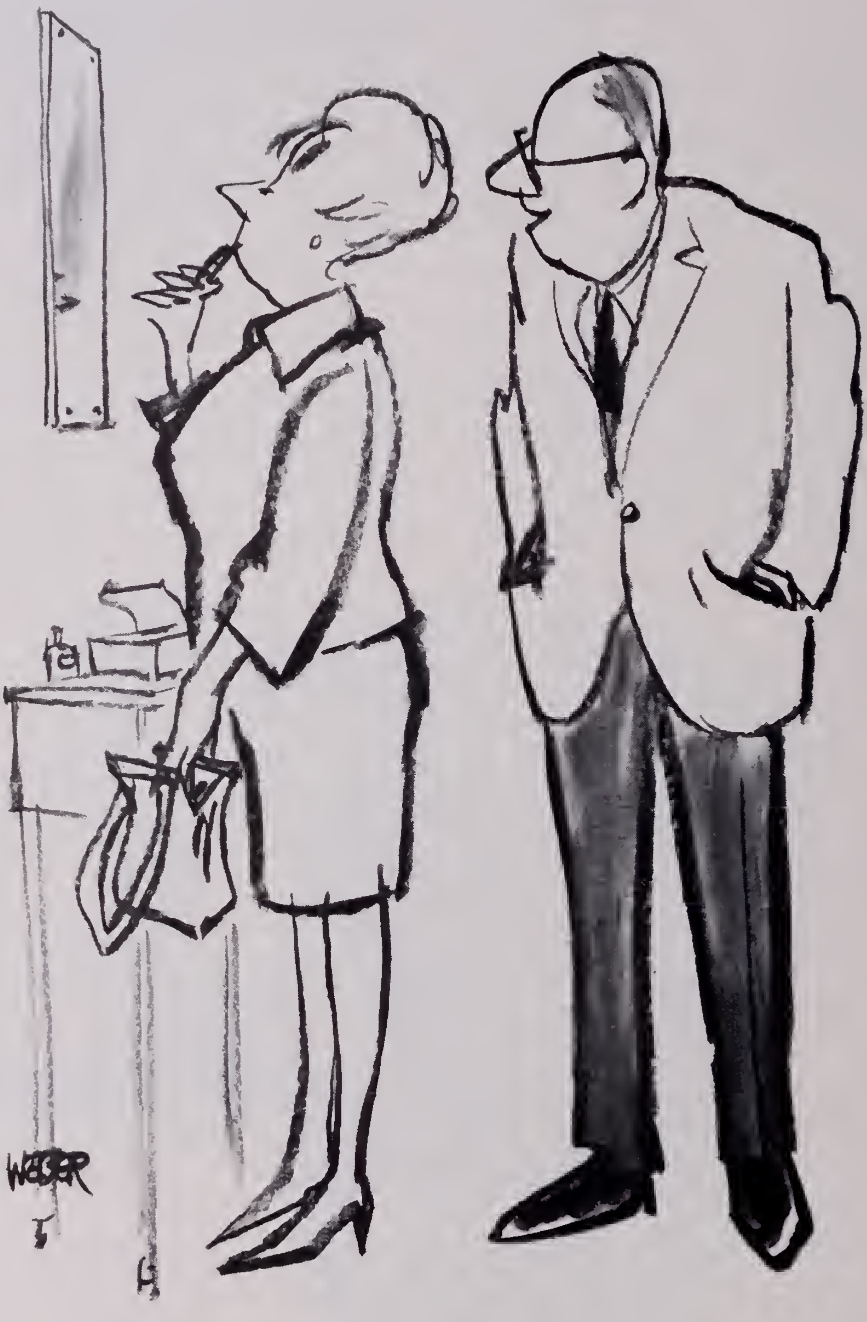
Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg.; and chlorpheniramine maleate, 4 mg. Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

With Novahistine LP tablets and Novahistine Singlet™ tablets, you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient. Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever.
Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.

Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.
Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention.
Caution ambulatory patients that drowsiness may result.

DOW **PITMAN-MOORE** Division of The Dow Chemical Company,
Indianapolis

"Nothing else I've tried seems to work, so I decided to give you a crack at it."



"Everything looks fine, but we should do something about that extra weight you're putting on."

Say you saw it in Michigan Medicine

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Bamadex® Sequels®

Ralph Blocksma, M.D., Grand Rapids,

visited the Dominican Republic and was received by president Dr. Joaquin Balaguer. He was honored for the efforts made by the Medical Assistance Program of which Doctor Blocksma is chairman, to reduce infant mortality in the Dominican Republic.

Bonnie R. Wolfram, M.D., Detroit,

participated in the National Budget and Consultation Committee Meetings in New York, held annually to review budget requests from national agencies in federation, supported by United Funds.

Chester S. Koop, M.D., Flint,

is the new president of the Genesee County Tuberculosis and Respiratory Disease Association.

James C. Cook, M.D., Detroit,

clinical associate professor at WSU, has been named a delegate of the American Roentgen Ray Society to the International Congress of Radiology in Tokyo in October, 1969.

Edward D. Sage, M.D., Kalamazoo,

recently celebrated his 90th birthday and announced his plans to retire after 66 years of active practice in the community. He received a citation from the Latvian Lutheran church.

Three Michigan doctors

presented papers at the meeting of the American College of Surgeons held in Munich in cooperation with the German Surgical Society. They are Robert W. Bailey, M.D., Ann Arbor, Reed O. Dingman, M.D., Ann Arbor, and James M. Pierce, Jr., M.D., Detroit.

Harold L. Upjohn, M.D., Kalamazoo,

has been named Vice President of the Upjohn Company in charge of Medical Affairs. He had been Director of Medical Research for the company since 1962.

MSMS Members In The News

BY CAROL MAXWELL
OF THE MSMS STAFF

Frederick Van Duyne, M.D., Flint,

was elected a delegate to the Republican National Convention from Michigan's 7th District. Also chosen at the Republican State Convention were Donato Sarapo, M.D., Adrian, alternate delegate from the 2nd District and Jack M. Stack, M.D., Alma, alternate delegate from the 10th District.

Harry A. Towsley, M.D., Ann Arbor,

has been appointed to the Board of Trustees of Northwood Institute in Midland.

Raymond W. Waggoner, M.D., Ann Arbor,

has been honored by two medical groups. The American College of Psychiatrists presented the E. B. Bowis Award for 1968 to him at the annual meeting of the College in Boston in recognition of his "outstanding achievements, contributions, and leadership in the field of psychiatry." A special Resolution of Appreciation by the Michigan Society for Mental Health expressed esteem and lauded him for his many years of service to the mentally ill in Michigan.

James J. McClendon, M.D., Detroit,

has been appointed president of the Detroit Board of Health.

Willard Hayes, M.D., Norway,

was honored at a public dinner at which he received the 1968 "Citizen of the Year" award given by the Iron Mountain Lions Club for outstanding humanitarian and civic endeavors.

J. Daniel Cline, M.D., Midland,

was chosen "Citizen of the Year, 1968" by the Midland Civitan's Club for his "unselfish civic service and the promotion of good citizenship by example, and specifically for his work with young people and the promotion of interest and excellency in athletics."

Morley B. Beckett, M.D., Ann Arbor,

has been named Doctor Director Emeritus of the University Health Service and Professor Emeritus of Community Health Service by the Regents of Alumni of the University of Michigan. He was director of the university health service and professor of public health from 1955 until his retirement this year.

E. F. Arscott, M.D., Rogers City,

will soon be leaving his private practice to become assistant medical director of the Ford Motor Company, Cleveland.

See Program Inside for '68 Annual Session

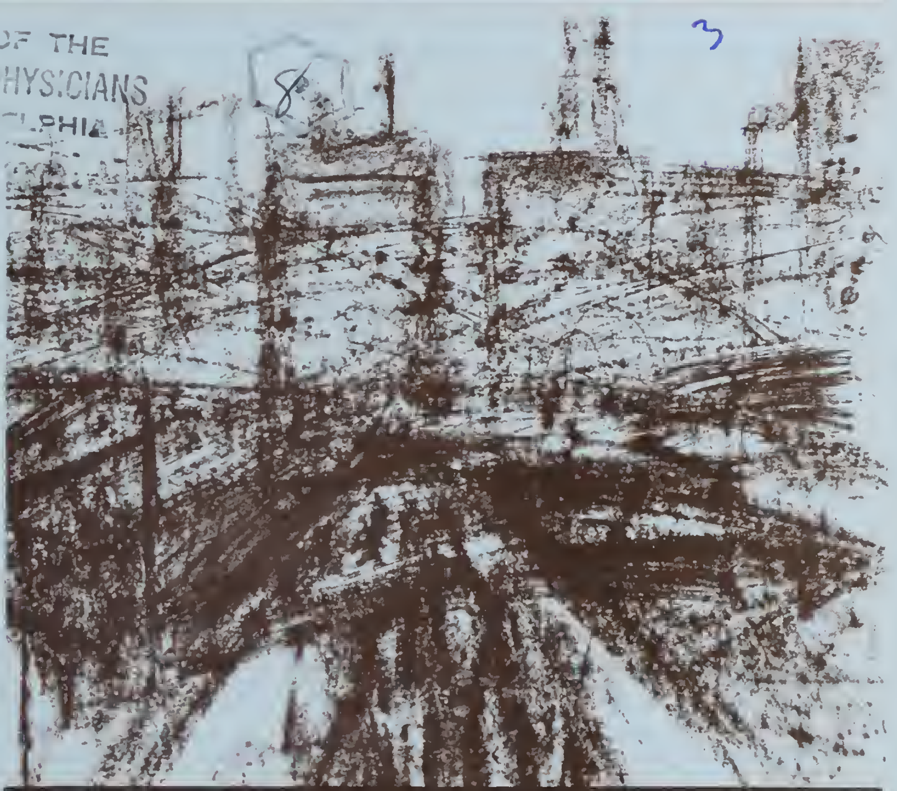
Early response to the program for the 1968 MSMS Annual Scientific Session has been enthusiastic. Physicians have commented upon the timeliness of the topics and the high quality of the medical authorities obtained for the Annual Session, September 25-26 in Detroit.

A program — more in detail than the early one last month — appears in this issue.

Every MSMS member is urged by MSMS President Bradley M. Harris, M.D., to decide now to participate in the excellent postgraduate experience. Doctor Harris praises the work of the Annual Scientific Session Program Committee and Alexander J. Walt, M.D., Detroit, the chairman.

The 1968 Scientific Session on Wednesday and Thursday, September 25-26, will follow the annual House of Delegates meeting, which again will extend from Sunday night, September 22 through the annual election on Tuesday night, September 24.

Joining MSMS again in Detroit will be the Woman's Auxiliary to MSMS, which will be in session September 24-25-26, and the Michigan State Medical Assistants Society, which will confer on September 25-26.



Urge Every MSMS Member Attend September 25-26

The 1968 Scientific Program offers General Sessions, MSMS Section Programs, Four All-Day Postgraduate Courses, Meetings of Medical Specialty Organizations, Fireside Discussions, Exhibition Hall, and other educational events.

A review of the Program, on the inside pages of this issue of *Michigan Medicine,* will show that 22 MSMS Sections and 8 Specialty Societies will hold scientific sessions during the MSMS Annual Session.

Members of the Michigan Academy of General Practice will receive credit for each hour they attend the 1968 Annual Session. Application for approval should be made to James Dooley, M.D., Chairman, Commission on Education, 3210 S. Dort Highway, Flint.

MSMS ANNUAL SESSION, SEPT. 25-26

House of Delegates, Sept. 22-23-24

1968 Annual Session Program

ALL EVENTS AT SHERATON-CADILLAC, DETROIT, UNLESS OTHERWISE STATED

Wednesday Morning, September 25

7:30- 8:45 a.m. **Breakfast Roundtable Discussion on Obstetrics-Gynecology**
Sponsored by Section on Obstetrics and Gynecology
Use of the Laparoscope
Alfred I. Sherman, MD, Wayne State University

8:45- 5:00 p.m. **All-Day Postgraduate Course on Infectious Diseases**
By advance registration only

MORNING:

Moderator: A. Martin Lerner, MD, Wayne State University

9:00- 9:45 a.m. New Virus Vaccines (Respiratory, Measles, Mumps)
Jerome O. Klein, MD, Harvard Medical School

10:00-10:45 a.m. Extended Rubella Syndrome and Its Prophylaxis
Mary M. Carruthers, MD, Chicago Medical School

11:00-11:45 a.m. Interferon and Its Clinical Application
Thomas C. Merigan, MD, Stanford University School of Medicine

AFTERNOON:

Moderator: Harry F. Dowling, MD, Chicago

2:00- 2:45 p.m. Antiviral Chemotherapy
Jerome A. Gold, MD, Woman's Medical College of Pennsylvania

3:00- 3:45 p.m. New Antibiotics Versus Gram-Negative Infections Including the Penicillins, Cephalosporins, Tetracyclines and Gentamycin
Edward L. Quinn, MD, Ford Hospital, Detroit

4:00- 4:45 p.m. Special Toxicities of Older Antibiotics, Tetracycline, Kanamycin, Colistin
Frank Cox, MD, Ford Hospital, Detroit

8:45- 5:00 p.m. **All-Day Postgraduate Course on Pulmonary Diseases**
By advance registration only
Chairman: Geoffrey L. Brinkman, MD, Wayne State University

MORNING:

Benjamin M. Lewis, MD, Moderator, Wayne State University
Management of Respiratory Failures

8:45 a.m. Clinical Manifestation
Kaye H. Kilburn, MD, Duke University Medical Center

9:10 a.m. Physiology of Respiratory Failure
Benjamin M. Lewis, MD, Wayne State University

Treatment

9:50 a.m. Maintenance of a Clear Airway
Kaye H. Kilburn, MD, Duke University Medical Center

10:20 a.m. Use of Oxygen
Gordon L. Snider, MD, Boston University School of Medicine

11:00 a.m. Ambulatory Care
Thomas L. Petty, MD, University of Colorado Medical Center

11:30 a.m. Panel of Five Course Lecturers

AFTERNOON:

Moderator: Geoffrey L. Brinkman, MD, Wayne State University

Pulmonary Embolism

2:00 p.m. Diagnosis — Clinical
Thomas L. Petty, MD, University of Colorado Medical Center

2:15 p.m. Diagnosis — Radiological
Manuel Viamonte, MD, University of Miami School of Medicine

2:45 p.m. Therapy — Medical
Kaye H. Kilburn, MD, Duke University Medical Center

3:00 p.m. Therapy — Surgical
Rodman Taber, MD, Ford Memorial Hospital, Detroit

Acid-Fast Infections

3:45 p.m. Atypical Acid-Fast Infections
Gordon L. Snider, MD, Boston University School of Medicine

4:20 p.m. Prophylactic Anti-Tuberculosis Chemotherapy
Wintrop N. Davey, MD, University of Michigan

9:00-Noon **Breast Carcinoma: General Session**

Moderator: Alexander J. Walt, MD, Wayne State University

9:00 a.m. The Problems and Aspects of Cure — Mammography and Xerography
John A. Wolfe, MD, Wayne State University

Indications and Results of Chemotherapy in the Management of Breast Cancer
Vainutis K. Vaitkevicius, MD, Wayne State University

10:45 a.m. Aspects of Palliation — Surgical Aspects
William J. Fry, MD, University of Michigan

The Place of Radio Therapy in Carcinoma of the Breast
Doctor M. Betty Bennett, University of Capetown, So. Africa

11:30 a.m. Approach to Surgery of the Potentially Curable Case
Cushman D. Haagensen, MD, Columbia University College of Physicians and Surgeons

William L. Donegan, MD, University of Missouri School of Medicine

9:00-10:00 a.m. Selective Abdominal Arteriography: General Session
Moderator: Roger L. Rian, MD, Ford Hospital, Detroit

Angiography in Liver Diseases, Splenic Pathology, Pancreatic Gastric, Small and Large Bowel and Renal Diseases
Manuel Viamonte, Jr., MD, Univ. of Miami School of Medicine

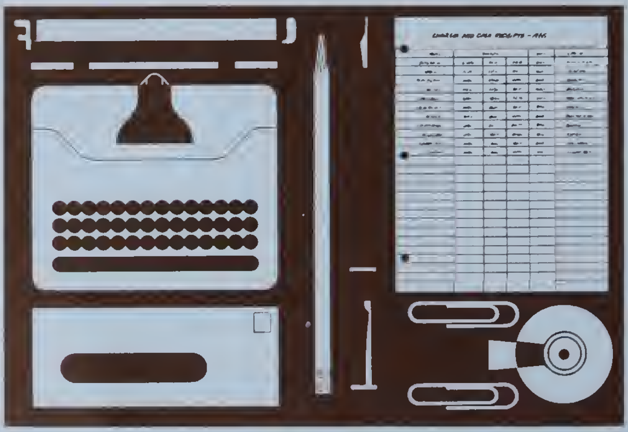
Business Meeting

A Practical Approach to Carcinoma of the Lung
Hyman A. Brewer, II, MD, Los Angeles



An office Management Seminar will be offered for new physicians, residents, interns and senior medical students, Thursday, September 26 from 3 to 5:30 p.m., at the Sheraton-Cadillac Hotel.

Norman Henderson, M.D., East Lansing, is chairman for the MSMS committee planning this event.

A grant from Merck Sharp and Dohme makes this new Annual Session feature possible.

ADD: IN MEMORIAM

In addition to the names reported in the July "In Memoriam," the following news has reached the MSMS office. Details will follow in the August *Michigan Medicine*:

Francis J. Fitzpatrick, M.D., Pontiac, died May 22.

James M. Gaffney, M.D., Detroit, died March 17.

Walter E. McGillicuddy, M.D., Dearborn, died April 5.

Fred T. Reid, M.D., Troy, died June 12.

Nathan J. Reisman, M.D., Detroit, died June 14.

Maynard Southworth, M.D., Kalamazoo, died June 10.

Hugh A. Sullivan, M.D., Detroit, died June 1.

Gordon C. Tornberg, M.D., Cadillac, died May 26.

U-M Reunion Set Oct. 11-12

The Medical Center Alumni Society will hold its 1968 reunion at the University of Michigan, October 11-12.

Special guests will be the 50-year graduates from the 1918 medical and nursing classes. Other alumni especially invited are those whose graduating year ends with a 3 or 8, since the year 1918. For example: class of 1923, '28, 33, etc.

Presiding over the Annual Meeting in the North Campus Commons at noon, October 11 will be John O. Goodsell, M.D., Saginaw, president. Speakers on the program are Robben Fleming, President of U of M; William N. Hubbard, Jr., M.D., Dean of the Medical School; and Rhoda R. Russell, R.N., Dean of the Nursing School. The annual meeting will close with special ceremonies to induct the Class of 1918 into the Emeritus Club.

Lieberthal Selected President Upper Peninsula Medical Society

Paul Lieberthal, M.D., Ironwood, is the new president of the Upper Peninsula Medical Society elected during its recent annual meeting in Pembine, Wisconsin. Outgoing president is William S. Jones, M.D., of Menominee.

Continuing as secretary-treasurer is L. Grant Glickman, M.D., also of Menominee.

Bradley M. Harris, M.D., MSMS president from Ypsilanti, and George W. Slagle, M.D., MSMS delegate to the American Medical Association from Battle Creek, were among the featured speakers at the meeting.

Plans were made for the next annual meeting in Ironwood on the third weekend in June of 1969.

Cohen Investigates MD Medicare Fees

FROM AMA NEWS SERVICE

Health, Education and Welfare Secretary Wilbur Cohen estimated that the Medicaid program may cost the federal government between $2.5 and $3 billion in the fiscal year 1971.

The estimate for the next fiscal year (1968) is $2.1 billion. The original estimate for the current year was $1.7 but that proved substantially low.

Cohen told a House appropriations subcommittee that HEW was very much concerned and was making an intensive investigation of reported abuses by some physicians in federal medical programs.

OFFER BOOKLET RE MSMS STAND

MSMS members interested in obtaining a copy of "Where Does MSMS Stand?" are invited to write to Hugh W. Brenneman, Executive Director, Michigan State Medical Society, 120 West Saginaw, East Lansing, Michigan 48823. Chapters from the booklet are being printed each month in the *Michigan Medicine* journal.

FERGUSON CHOSEN APS PRES-ELECT

James Ferguson, M.D., Grand Rapids, has been selected to head the American Protologic Society.

Dr. Ferguson, who has served four years as secretary of the society, was named president-elect at the annual meeting in Denver. He will become president in June 1969.

MMS, PRESCAD SIGN DRUG PACT

Michigan Blue Shield and the Wayne County Health Department have contracted to furnish the first private sector drug vending and financing in the nation under Title V of the 1965 Social Security Amendments.

The drug contract provides that children of low income families may take "PRESCAD" prescriptions to any licensed pharmacy, which will in turn bill Blue Shield for the service.

PRESCAD — the name comes from the first letters of the classes of those eligible for the program, PREschool, SChool and ADolescent Children — is the Detroit-area program to furnish comprehensive and continuing health care in low income areas, apart from Medicaid. It exists under various names in 57 cities.

(From National Association of Blue Shield Plans newsletter, Vol. 4, No. 6.)

A Dead C + Scroll

BY INIS L. CLAUDE, JR.
ANN ARBOR

Verily, brethren, I say unto thee, he that putteth in no input, the same receiveth no output.

The prophet, Tubal, rose up and spake: "He that eateth and drinketh until midnight, and fighteth and carouseth until daybreak, yea, verily, there shall be no sleep for him that night.

"He that suppeth with psychologists, and breaketh bread with economists, and drinketh with sociologists, the same shall promote interdisciplinary cross-sterilization."

Ibid begat op cit, and op cit begat loc cit. Loc cit begat ipse dixit. So be it.

Thus saith the prophet, Ibid: "Yea, verily, he that procrastinateth, the same shall be late. And there shall be weeping and g-nashing of teeth.

"He that publisheth not, the same perisheth. He that citeth another in friendly footnote, the same shall be quoted in turn. To him that writeth a critical review, it shall be said, 'Judge not, that ye be not judged.' He that researcheth unceasingly shall gain everlasting tenure, and all the fringe benefits appertaining thereunto.

"Behold! He that cocktaileth and highballeth, dwelleth in the spirits. Let every man look to his own spiritous life.

"Blessed is he that surveyeth and computeth, for unto him shall be granted. Blessed is he that simulateth, for his conceptual framework shall cover a multitude of sins. But woe unto him who hath no model, who hypothesizeth not, and whose only rigor is mortis, for he shall be cast into outer darkness."

And now abideth teaching, service, and research. But the greatest of these is research.

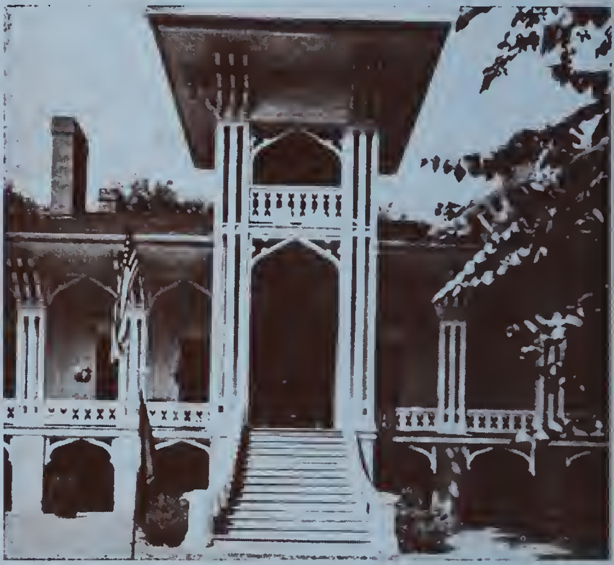
And Tubal declared to the assembled multitude, "He whose cup runneth over, the same should sip with care."

Thus spake the prophet Ibid: "Woe unto him that committeth not, for he shall be unpleasing in the sight of the Dean.

"Blessed be the name of the Ford. He that buildeth his center upon a foundation of Rockefeller shall endure, though the winds blow and the rains fall and beat upon that center. And manna from Carnegie will flow unto him, like the dews of Hermon that ran down upon Aaron's beard, even unto the hem of his garment. He shall dwell in a land of milk and money, and his research assistants shall rise up and call him Guggenheim. Blessed be the name of the Ford.

And the prophet cried out in the wilderness, saying: "Oh, ye Pharisees and Assistant Professors, ye men of short bibliographies and little faith, I declare unto thee — he that tooteth not his own horn, the same shall not be tooted." ☐

(Note: This article is reprinted with permission from the Michigan Daily and the Journal of Higher Education, and the author, who is associated with the University of Michigan Department of Political Science.)



KNOW MICHIGAN

Ever see this building?

The dream of bringing the spirit of Hawaii back to Marshall, Michigan, inspired Abner Pratt, a justice of the early Michigan Supreme Court and United States Consul to Hawaii in the 1850's, to have his "Honolulu House" constructed.

Justice Pratt loved the Hawaiian Islands, but had to return to Marshall because of the illness of his wife. The "Honolulu House" is a replica of his residence in Hawaii, and, until he died in 1864, Pratt re-duplicated his life in Hawaii by furnishing the house in a tropical decor, wearing tropical clothing, and serving the food he had eaten in Hawaii.

President Taft once spoke to a crowd of ten thousand from the veranda, and George Romney used the same spot to give an address in 1962. Presently the house is a historical museum under the direction of the Marshall Historical Society.

Photo by Allen Stross, Detroit.

MSMS CAMPAIGNS FOR PAP TEST

"If women do not become aware of the need for Pap tests, then 300 Michigan women and 14,000 in the nation will die in 1968."

That public warning has been issued by the MSMS Cancer Committee.

Because cervical cancer, in its early stages, is easy to detect and cure, the MSMS Cancer Committee is urging all Michigan women to get a yearly Pap test. The medical society committee is especially concerned because the majority of the 300 women who die every year in the state will leave small children motherless in the home.

"Only 18% of adult women living in Michigan have ever had such a test," reports Vainutis K. Vaitkevicius, M.D., Director for Clinical Cancer Services at Wayne State University and a member of the MSMS Committee.

AMA Offers Flier On Smoking-Health

As an additional cautionary reminder about the health effects of cigarette smoking, the AMA has published a new Timely Tip — "The Cigarette — A Dubious Companion."

"The Cigarette — A Dubious Companion" describes the effects of each puff of smoke as it enters the breathing passages and air sacs of the lungs and stresses that certain conditions and diseases are believed to be aggravated by cigarette smoking.

Some physicians include the AMA Timely Tips in their mailings and offer them in their reception rooms.

There are 100 Timely Tips to a set. Copies are available from the AMA Order Department at 20 cents each for 1-4 sets and 15 cents each for 5 or more sets.

MDPAC Breakfast Slated Sept. 25; Conyers to Talk

All MSMS members are invited to a special MDPAC Breakfast, Wednesday, September 25 in Detroit during the MSMS Annual Session.

Congressman John Conyers, Jr., of Detroit, will speak about the importance of citizenship participation in good government.

George Reno, M.D., Detroit, member of the MDPAC Board of Directors, is serving as chairman for the breakfast program.

MSMS members can read a progress report about MDPAC in the August issue of *Michigan Medicine.*

SERVES IN VIETNAM

Daniel D. Chapman, M.D., of Owosso, is currently serving in South Vietnam under the Volunteer Physicians for Vietnam program sponsored by the AMA.

Give $20,431 in AMA-ERF Checks to 3 Medical Schools

Checks for $20,431.63 were presented to the three Michigan medical colleges by MSMS officers in a ceremony June 5 at the MSMS headquarters.

The checks represented recent contributions by Michigan physicians and others for medical schools at the University of Michigan, Wayne State University and Michigan State University. The checks were from the AMA-ERF, which handles direct contributions to each of the 94 medical schools and also prorates general contributions by physicians and other interested individuals, companies and foundations.

The University of Michigan check was for $12,203.11; Wayne State University for $6,911.91, and Michigan State University for $1,317.61. The contributions were unrestricted and can be used by the medical schools for whatever purpose the school has greatest need.

Receiving the checks were Fred J. Hodges, M.D., for University of Michigan; Muir I. Clapper, M.D., Wayne; and Andrew D. Hunt, Jr., Dean of the College of Human Medicine, Michigan State University.

SPECIAL BEAUMONT COMMITTEE INSPECTS POPULAR MEMORIAL

Members of the MSMS Beaumont Memorial Committee toured the Beaumont attraction at Mackinac Island recently. They found again that the Memorial building and authenic exhibits are popular with thousands of Island visitors.

MSMS restored in 1954 the Astor retail store where Alexis St. Martin was wounded by a shotgun blast and was first treated by William Beaumont, M.D., the fort surgeon.

B. M. Harris, M.D., MSMS President, is chairman of the Beaumont Committee.

Course Content

Infectious Diseases

Chairman: A. Martin Lerner, MD

See Page 918 for Speakers, Subjects.

Recent advances in diagnosis, prevention, and therapy of bacterial and virus diseases will be discussed. Topics include respiratory virus, measles, and mumps vaccines; rubella; antiviral chemotherapy; interferon and new antibiotics with their special toxicities.

Pulmonary Diseases

Chairman: Geoffrey L. Brinkman, MD

See Page 918 for Speakers, Subjects.

The Pulmonary Course will cover management of respiratory failure, beginning with a discussion of the clinical manifestations and physiological abnormalities, and the best methods of care and rehabilitation. Speakers also will discuss pulmonary embolsis and advances in radiological techniques, medical therapy and surgical prevention and cure; and also acid-fast infections.

Blood Diseases

Chairman: Arnold R. Axelrod, MD

See Page 922 for Speakers, Subjects.

The postgraduate course in hematology is designed to orient the practicing physician to some of the common hematological problems manifested by changes in the peripheral blood cells. Our purpose is to develop an approach to the proper diagnosis and management of these entities.

Difficult Decisions in Digestive Diseases

Chairman: William S. Haubrich, MD

See Page 923 for Speakers, Subjects.

Practical problems encountered in gastroenterology, of concern to both the physician and the surgeon, will be explored by the case method. Each of six well-known MSMS members, active in the practice of gastroenterology, has selected and will present a case from their own files vividly illustrating particular problems in diagnosis and management. Doctors enrolled for the course will participate actively with invited guest experts in seeking answers to the questions raised. Controversy is expected, profitable discussion is assured.

LACTINEX®

TABLETS & GRANULES

■ to help restore and stabilize the intestinal flora

■ for fever blisters and canker sores of herpetic origin

LACTINEX contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

First introduced to help restore the flora of the intestinal tract in infants and adults,[1, 2, 3, 4] LACTINEX has also been shown to be useful in the treatment of fever blisters and canker sores of herpetic origin.[5, 6, 7, 8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

He is elderly, he is on corticosteroids, when he needs an antibiotic he may be a candidate for

DECLOSTATIN® 300 b.i.d.

Demethylchlortetracycline HCl 300 mg
and Nystatin 500,000 units
CAPSULE-SHAPED TABLETS Lederle

guard susceptible patients against intestinal monilial over-
wth during broad-spectrum therapy—the protection of
statin is combined with demethylchlortetracycline in
CLOSTATIN.

or your susceptible candidates, prescribe DECLOSTATIN
he broad-spectrum therapy that prevents monilial
rgrowth.

traindication: History of hypersensitivity to demethylchlortetracy-
e or nystatin.

ning: In renal impairment, usual doses may lead to excessive accumu-
on and liver toxicity. Under such conditions, lower than usual doses
indicated, and, if therapy is prolonged, serum level determinations
be advisable. A photodynamic reaction to natural or artificial sun-
t has been observed. Small amounts of drug and short exposure may
duce an exaggerated sunburn reaction which may range from ery-
na to severe skin manifestations. In a smaller proportion, photo-
rgic reactions have been reported. Patients should avoid direct
osure to sunlight and discontinue drug at the first evidence of skin
omfort. Necessary subsequent courses of treatment with tetracy-
es should be carefully observed.

cautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken.

In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney—rise in BUN, apparently dose related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth—dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

MSMS PRESIDENT'S MESSAGE

Community Health Week Offers Three Targets

Most Americans today are living longer, healthier, more active and useful lives than in any period of our nation's history.

Many factors are contributing to our healthier lives such as the important achievements of modern medicine in the past few decades, community efforts in providing modern hospitals, public awareness of good health practices, and significant contributions to medical progress that are being made by medical scientists world-wide.

The purpose of Community Health Week (October 20-26) will be to focus public attention on the dramatic advances which have occurred in medicine and health care. The Annual Community Health Week project is proclaimed by the AMA and MSMS to encourage each of us to stimulate a greater public understanding of the growth, high quality and availability of health resources and facilities within the individual community.

In addition to an evaluation of our present assets, the 1968 Community Health Week this fall will focus attention upon (1) the growing problem of drug abuse, (2) the need to encourage and support the programs encompassing physical fitness, and (3) the expanding, urgent need for young men and women to train for medical and allied health careers. A career in medicine or any of its allied fields offers a challenging and rewarding future. You can help by encouraging capable young people to prepare for careers in health.

Each county society is urged to organize a health careers recruitment program. Doctors can speak to school assemblies, can consult with school counselors, can cooperate with the medical auxiliary and voluntary agencies, and can ask ahead for a visitation of the Michigan Health Council's health careers mobile.

As in other years, the Michigan Health Council and the Michigan Association of the Professions will jointly sponsor Community Health Week with MSMS.

All county medical societies are urged to develop appropriate programs marking the annual observance of Community Health Week, October 20-26 and to encourage other members of the community health team to join with them in planning and carrying out activities.

MICHIGAN STATE MEDICAL SOCIETY, 120 W. SAGINAW, EAST LANSING, MICHIGAN 48823

Mead Johnson -pharmaceuticals created for your specialized clinical needs

She relies
on your
contraceptive
advice

She can expect to continue Oracon for years

ORACON®

16 White—Ethinyl Estradiol, 0.1 mg. Tablets, 5 Pink—Dimethisterone, 25 mg., and Ethinyl Estradiol, 0.1 mg. Tablets

Only 4.4% of patients taking Oracon discontinued it because of side effects

ORACON in a total conception-control program. Generally, withdrawal bleeding is comparable to her usual menstrual flow, even after prolonged use. Incidence of amenorrhea was less than 1% in original studies. Breakthrough bleeding occurred in only 1.5% of full cycles completed, and intractable monilial vaginitis was not reported.

Patients can continue ORACON comfortably. For years. Although a cause and effect relationship has been neither established nor disproved, alertness to the possibility of serious occurrences such as thromboembolism is necessary in any program with any oral contraceptive. Contraindications, medical ramifications, and long-range considerations in the use of ORACON, the same as those for all oral contraceptives, follow.

Mead Johnson also offers these important prerequisites for success in a conception-control program: information for the patient to help her understand conception control; and packaging to guide her in using the product correctly, according to your directions.

to guide you in prescribing ORACON

Indication: Oral contraception.

Effectiveness: Although some pregnancies have occurred while on therapy, oral contraception is the most effective method known.

Mechanism of Action: Gonadotropin suppression.

Contraindications: Thrombophlebitis, history of thrombophlebitis or pulmonary embolism; liver dysfunction or disease; known or suspected carcinoma of breast or genital organs; undiagnosed vaginal bleeding.

Warnings: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia, or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn. Since the safety of ORACON in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods, pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule, the possibility of pregnancy should be considered at the time of the first missed period. Detectable amounts of the active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this to the infant has not been determined.

Precautions: The pretreatment physical examination should include special reference to breast and pelvic organs, as well as a Papanicolaou smear. Endocrine and possibly liver function tests may be affected by treatment with ORACON. Therefore, if such tests are abnormal in a patient taking ORACON, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of estrogen-progestogen preparations, pre-existing uterine fibromyomata may increase in size. Because these agents may cause some degree of fluid retention, conditions that might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. ORACON should be used with caution in patients with a history of cerebrovascular accident. In relation to breakthrough bleeding, as in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In cases of undiagnosed vaginal bleeding, adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged ORACON therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a small percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving ORACON therapy. Because of the occasional occurrence of thrombophlebitis and pulmonary embolism in patients taking oral contraceptives, the physician should be alert to the earliest manifestations of the disease. Because of the effects of estrogens on epiphyseal closure, ORACON should be used judiciously in young patients in whom bone growth is not complete. The age of the patient constitutes no absolute limiting factor, although treatment with ORACON may mask the onset of the climacteric. The pathologist should be advised of ORACON therapy when relevant specimens are submitted.

Side Effects: The following adverse reactions have been

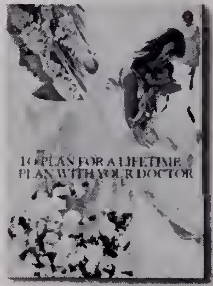
continued on next page

observed in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post-partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals, mental depression. Although the following have been reported as side effects in users of oral contraceptives, no cause and effect relationship has been established: anovulation post-treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption, itching. Post-marketing experience with Oracon has revealed that hypermenorrhea and acne may also occur. The following occurrences have been observed in users of oral contraceptives. A cause and effect relationship has neither been established nor disproved: thrombophlebitis, pulmonary embolism, neuro-ocular lesions. The following laboratory results may be altered by the use of oral contraceptives: increased sulfobromophthalein and other hepatic function tests; coagulation tests (increase in prothrombin, Factors VII, VIII, IX, and X); thyroid function (increase in PBI and butanol extractable protein bound iodine and decrease in T^3 values); metyrapone test; pregnanediol determination.

Administration: Counting onset of menses as Day 1, the patient starts medication on Day 5 of the cycle and takes one white tablet daily from Day 5 through Day 20, then one pink tablet daily from Day 21 through Day 25. Patients should be cautioned to follow the dosage schedule strictly. Evening administration is suggested. An additional contraceptive method is recommended for the first 7 tablet days of the first cycle of Oracon usage. If the regimen is interrupted, for the fullest possible protection an additional contraceptive method is recommended for the rest of the cycle. If flow should not occur by the 7th day after taking the last pink tablet, the next course of therapy should be initiated on that day, thereby allowing 6 full days without medication. Some physicians prefer to stipulate that the patient never allow more than 6 unmedicated days to elapse between cycles regardless of the time of onset of withdrawal bleeding. If two consecutive periods are missed, the possibility of pregnancy should be considered and the patient should report to the physician. However, pregnancy should be suspected at the first missed period if the patient has deviated from instructions. For those few occasions when breakthrough bleeding occurs, the following recommendations are made: (a) Spotting. Continue medication. (b) Menstrual-type flow. Discontinue medication and begin a new medication cycle on the fifth day. Because of the rarity of frank breakthrough bleeding, especially after the first few cycles, it is not necessary to provide the patient with additional tablets to allow for doubling the dose. Recurring breakthrough bleeding, particularly after the first few cycles, should be reported to the physician for further investigation. Because of the common occurrence of increased cervical mucus, it is recommended that the patient be apprised of this possibility.

Availability: Oracon is available as 16 white and 5 pink tablets. Each white tablet contains 0.1 mg. of ethinyl estradiol; each pink tablet contains 25 mg. of dimethisterone and 0.1 mg. of ethinyl estradiol. Each month's supply includes patient instructions. Complete details on Oracon are available from Mead Johnson Laboratories.

to guide her in understanding and using conception control



TO PLAN FOR A LIFETIME PLAN WITH YOUR DOCTOR

A discussion of conception control for brides, "To Plan for a Lifetime, Plan with Your Doctor," is one of several booklets available through your Mead Johnson representative or directly from Mead Johnson Laboratories.

The Pakette® dispenser helps prevent patient error by showing her when to start her tablets and when to take every tablet all month long.

Where Are We Heading?

BY J. H. AHRONHEIM, M.D.
JACKSON

(Note: This editorial first appeared in a recent issue of the Foote Hospital Pathological News Bulletin and is reprinted with permission of Doctor Ahronheim, who is also the editor. BLM)

According to recent reports in the press, the American Medical Association is considering steps designed to improve emergency care. This report does not exactly spell out what is meant by emergency care; it may be the attempt to relieve the pressure on hospital staff members in covering emergency service, or it may be to provide prompter service to those patients who are trying desperately and not too successfully to get a doctor's appointment, or it may be both.

Whichever it may be, the AMA is aware of a problem which is becoming increasingly more serious, and of which there is little hope in sight that it will improve. It is nationwide and is certainly felt more and more in our own community. An aging medical profession is losing more members by death and retirement than are being replaced by the slow influx of young men; the remaining practitioners are overworked and unable to take on more of a work load, physically and time-wise.

TO COMPLICATE THINGS even more, medicine is becoming more complex and there is greater demand for highly specialized diagnostic and therapeutic procedures than ever before. Medical practice is becoming a practice of specialties and the institution of family physician and general practitioner is slowly becoming a matter of the past. Today, we are no more satisfied with the patients' care which was considered standard 50 and even 25 years ago. To be rated a reasonably good physician, one must be certified by all sorts of professional bodies. Hospitals don't count anymore unless they are accredited by an increasing number of hospital organizations. Every person who has some connection with the practice of the healing arts needs now a license for whatever he is trained to do. Training and more training is emphasized. We are trying to make nurses out of aides, doctors out of nurses and university professors out of practitioners.

Obviously, all this is done to upgrade medical practice and has undoubtedly contributed to making American medical science the leader in the world. But it still does not take care of the one problem which is facing the entire nation: giving John Doe the care which he needs and when he needs it. Patients seeking a doctor's appointment often have to wait weeks before an available spot is found for them on the physician's schedule. The doctors do their utmost to meet the medical demands of the community, but there are still only 24 hours in a day, and coronary arteries can take only that much.

WHAT ARE WE GOING to do about this situation?

If there were a simple answer to this question, I am sure, it would have already been given by those who have studied the problem. Yet, let's think about it for a while and let's do a bit of speculating. Perhaps we might get some ideas from past experiences of our profession. Let us go back, for example, to the times, not too far removed, when a physician had his own little laboratory in the back of his office where he performed the simple tests which were known then, urinalysis, blood counts, occult blood determinations, and a few others which may or may not be obsolete today. When more tests were developed and laboratory medicine became more complex and sophisticated, the doctor needed a helper, an assistant, a technician. Usually it was his nurse or office girl whom he would teach the few tests which he was able to do. Later schools would be established for the purpose of turning out trained laboratory technicians. Thus, the fine profession of the medical technologist evolved.

Similarly, other phases of the practice of medicine, once the sole prerogative of the physician, would be delegated to specially trained personnel, and the professions of the physiotherapist, the dietitian, the anesthetist, and a few others were developed. They would work under the supervision of the physician and relieve him of many time consuming duties. I could well see that we carry this trend further yet. I could envision technicians for other phases of the practice of medicine by which a person would be trained solely for one specific phase, such as taking care of emergency cases, doing house calls for pediatric and obstetrical cases (there was nothing wrong with midwives who, in the past, had taken care of confinement cases most efficiently), making emergency

For smooth appetite control plus mood elevation

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form

5 mg.
10 mg.
15 mg.

For patients who can't take plain amphetamine

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

The Program

Weight Control Booklet

Specifically written to help your patients understand why they are overweight, and what they can do about it. The booklet stresses the importance of *changing lifelong eating habits* and explains how this can be done, sensibly, comfortably—and permanently. There is, also, a comprehensive list of foods showing their caloric content.

the secret of controlling your weight

Food Diary

Designed to help the overweight patient follow your eating instructions. Space is provided for breakfast, lunch, supper, and even snacks. By writing down everything that's eaten each day, the patient is constantly reminded that she's trying to change her eating habits. And you are furnished with a written record of how well she's doing.

Picture Menu Booklet

A large (10″ x 10″) booklet which features appetizing lunch and dinner menus for every day of the week. The meals are depicted in full color and the correct portion size so that the dieter can see the amount of food that's recommended. Patients are pleasantly surprised to learn that each day's meals add up to only 1,000 calories. 801444

Brief Summary

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

Indications: Desoxyn and Desbutal are used orally as appetite suppressants, for reduction of mild mental depression, and to help in management of psychosomatic complaints or neuroses. Desoxyn, when administered parenterally, may be used as a vasopressor agent or analeptic.

Contraindications: Methamphetamine (in Desoxyn and Desbutal) is contraindicated in patients taking a monoamine oxidase inhibitor. Do not use pentobarbital (in Desbutal) in persons hypersensitive to barbiturates.

Precautions, Side Effects: Observe caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs. Prolonged usage may lead to tolerance or psychic dependence. Careful supervision is necessary to avoid chronic intoxication and drug dependence.

Amphetamine side effects such as headache, excitement, agitation, palpitation or cardiac arrhythmia usually may be controlled by reducing the dose. Paradoxically-induced depression is an indication to withdraw the drug. Pentobarbital (in Desbutal) may cause skin rash. Nervousness or excessive sedation with Desbutal is often transient.

decisions until the physician could take over. The physician, under whom these technicians would work, would be responsible for the technician's actions. The training would have to concentrate not only on making the student acquainted with his duties but, perhaps even more so, on making him aware of his limitations.

YOU MAY SAY that there are serious objections to this sort of medical practice by technicians. You may argue that the patient who calls a doctor, wants to be seen by a doctor and not by a technician. But let us ask the same patient if he would rather suffer for hours until the doctor finally shows up or would settle on a specially trained person who would give him the desired relief until the doctor can take over. You may say that this type of practice violates the law pertaining to the practice of medicine. Maybe so, but, if need be, laws can be changed and this type of nonphysician assistant could develop into a well recognized profession sanctioned by law. You may argue that technician practice may impair the quality of the practice of medicine.

As long as the technician works under the doctor's strictest supervision, this is a very remote possibility, in fact, it may even improve medical practice, just as the profession of the medical technologist has improved medicine.

Whatever our objections may be, we have to face facts and have to compromise somewhere and sometime. If we don't, the medical profession will some day consist of long-haired super-scientists whose minds are perpetually in the clouds while the patients suffer from the common cold and perforated appendices.

LET'S FACE IT, the public is already getting mighty impatient with us. When a patient is miserable, he is not concerned about a doctor's tight schedule, or the rest which he didn't get last night, or the coronaries which threaten to close up on him. He wants relief and he wants it now.

Probably, things are not quite as critical as that yet, but the day will come when we have to make decisions if we want to live up to the principles to which we pledged ourselves when we recited the oath of Hippocrates. □

At Your Service

BY BROOKER L. MASTERS, M.D.
CHAIRMAN PUBLICATION COMMITTEE

Whether you work 9, 10 or 12 hours a day, you know there is one thing which can't be stretched — time!

We all fight for enough hours in the day to help the sick, to serve our communities, to be with our families, and to keep up to date.

Michigan Medicine is produced each month to help you in your struggle with the clock and the calendar. *Michigan Medicine* provides both good post-graduate scientific articles with Michigan flavor, and also timely information about MSMS and the AMA and about such vital topics as socio-economics, politics, education, et al.

Why not get the habit of reading *Michigan Medicine* regularly to win your struggle for more time? The articles are crisply written, tightly edited, neatly arranged on the pages, and then printed and mailed as quickly as possible.

At your service.

Paradox of the Medical World

BY JOHN H. VAN DE LEUV, M.D.
OXFORD, MICHIGAN

(Note: This article is reprinted with the permission of the author and the Oakland County Medical Society Bulletin, which carried this item in a recent issue. BLM)

Physicians, in their practice, often deal with urgent if not emergent problems. Immediate decisions and fast action are indicated. On the whole, we do very well in this aspect of our professional lives.

We are, with the exception, perhaps, of professional writers, the most prolific penpushers in the world. We as a group talk more than any other profession apart from politicians and, possibly lawyers.

UNFORTUNATELY, MOST OF the writing and talking is directed at our colleagues. By and large we, as individuals and groups, do very little to make our opinions known to "the public." We seem to want to hide in our shells when it comes to expressing our views in the regular news media. We seem to shun publicity except when it is forced upon us, when we are approached on a specific topic. We tend to hide behind our code of ethics as if it were a bombastic barrier between us and the non-initiated.

Why is it that we do not write more letters to editors, to our representatives? Why don't we publish more articles in the "lay" papers? Why don't we circulate any petitions? With the possible exception of the TV programs, we, probably, have the largest audience in the USA. If every physician — or, let us say, half of the physicians in the USA — convinced three patients per day of our stand on certain important social, political or economical questions, we would reach about half a million persons daily, that is almost all of the population in the United States in less than a year!

ARE WE TOO BUSY to let ourselves be known? Don't we have the medical societies to take care of this aspect? Can we be bothered by these nonmedical issues? Who would listen to us anyway; haven't we lost most of our prestige in society in the last few decades?

The answers are that the medical societies can never take the place of personally expressed opinions. People are getting tired of hearing the AMA declare its stand — that doctor's UNION is only after more money for the medical profession anyway! But they may sit up and pay attention to an expression of opinion of their "own doctor." Are we too busy? One would think not, when we can spend part of an evening in a meaningless hospital staff meeting, when we can find time to serve on two, three or more committees. Why should we be bothered by these non-medical issues? Because we are first of all citizens and, as such, have to make sure that our society is in tip-top shape (meaning society in the broadest sense possible).

COULD IT BE THAT we are after our own welfare alone and the rest of the populace be damned? This seems to be the attitude that we assume in the eyes of many. And justifiably so.

What then can we do? For a starter, we can get more involved in local, political and educational matters. We can let our representatives know what we think about pending legislation, not as a group but individually. We can urge more action on pressing problems and keep harping on these. It would not hurt to publicize the fact that we work three to five months each year for our good Uncle Sam, before we start paying our nurse's wages and the rest of our overhead, that we spend hours and hours in meetings that have the welfare of the community, directly or indirectly at heart.

But, for Heaven's sake, let people, your patients, hear from us! ☐

HUBBARD DISCUSSES PATIENT'S RIGHT TO DIE

The right of a patient to die may, in some cases, supersede the right of a physician to attempt to further his life by operations such as heart transplants, said William N. Hubbard, M.D., dean of the University of Michigan Medical School, in a recent address to the graduating class at the Albany Medical College of Union University in New York.

"To sacrifice human dignity at the time of death or to make the process of dying a burden upon the living is not in the highest tradition of medicine nor is it justified in the humanist traditions," said Doctor Hubbard.

"The humane physician must learn to understand and accept death as an inevitable part of living. He must beware of treating his own anxiety that death represents his personal failure by unrestrained use of life-support systems," the medical dean continued. ☐

et's be specific about Campbell's Soups… and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:

Ovulen-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

works the way a woman thinks

by weekdays...not "cycle days"

Whether it be "shopping day," "bridge day" or "housecleaning day," a woman is accustomed to thinking in terms of days of the week rather than in "cycle days." Ovulen-21 lets her remember her natural way. Once established, her starting day is always the same day of the week...because it is fixed at three weeks on — one week off and is independent of withdrawal flow.

The same Ovulen in the same low dosage... with the same low incidence of side effects and the same high degree of protection against pregnancy.

Note: Ovulen remains available in the familiar round Compack for those women who may wish to continue to use the traditional 20-day schedule. Be sure to specify Ovulen-21 to assure each new patient of the advantages of the new *Three Weeks On—One Week Off* schedule. She might appreciate your budget-minded authorization for a six-month supply (five Refills).

Indication — For oral contraception.

Contraindications — Thrombophlebitis or a history of thrombophlebitis or pulmonary embolism, liver dysfunction or disease, known or suspected carcinoma of the breasts or genital organs and undiagnosed vaginal bleeding.

Warnings — Discontinue medication pending examination if sudden partial or complete loss of vision, or sudden onset of proptosis, diplopia or migraine occurs. Discontinue if papilledema or retinal vascular lesions occur. Since the safety of Ovulen in pregnancy has not been established, rule out pregnancy before a patient who has missed two consecutive menstrual periods continues the tablets. Consider the possibility of pregnancy at the first missed withdrawal flow if the recommended schedule has not been followed. The active ingredients in oral contraceptives have been identified in the milk of mothers receiving these drugs. The significance of this to the infant has not been determined.

Precautions — The pretreatment physical examination should specifically include the breasts, pelvic organs and a Papanicolaou smear. Endocrine and possibly liver function tests may be affected by Ovulen. Such tests should be repeated two months after stopping the medication if their results were abnormal in a woman taking Ovulen. Pre-existing fibroids may enlarge under the influence of progestin-estrogen preparations. Patients with epilepsy, migraine, asthma, cardiac or renal dysfunction, which conditions might be influenced, require careful observation because Ovulen may cause some degree of fluid retention.

Ovulen should be used with caution in patients with a history of cerebrovascular accident. Nonfunctional causes should be considered if breakthrough bleeding occurs. Adequate diagnostic measures are indicated in women with undiagnosed vaginal bleeding. Carefully observe patients with a history of psychic depression and discontinue the medication if depression recurs to a serious degree. Any possible influence of prolonged Ovulen use on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. Carefully observe diabetic patients during Ovulen use since a decrease in glucose tolerance has occurred in a few such patients. Physicians should be alert to the earliest manifestations of thrombophlebitis and pulmonary embolism since such conditions occasionally occur in patients taking oral contraceptives. Use Ovulen judiciously in young patients in whom bone growth is not complete because of the effects of estrogens on epiphyseal closure. Age is no absolute limiting factor, although Ovulen use may mask the onset of the climacteric. Pathologists should be informed of Ovulen use when relevant specimens are submitted.

Side effects — The following adverse reactions have been observed in varying incidence in patients taking oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight (increase or decrease), changes in cervical erosions and secretions, suppression of lactation when used immediately post partum, cholestatic jaundice, migraine, allergic rash, rise in blood pressure in susceptible individuals and mental depression.

Although the following side effects have been reported in users of oral contraceptives no cause and effect relationship has been established: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme and nodosum, hemorrhagic eruption and itching. Thrombophlebitis, pulmonary embolism and neuro-ocular lesions have occurred in users of oral contraceptives, although a cause and effect relationship has been neither established nor disproved.

The following laboratory results may be altered by oral contraceptives: Bromsulphalein® and other hepatic function tests—increased; coagulation tests, including prothrombin, Factors VII, VIII, IX and X — increased; thyroid function — increase in protein-bound iodine and butanol extractable protein-bound iodine, and a decrease in T^3 values; metyrapone test and pregnanediol determinations.

Dosage and administration — One tablet of Ovulen-21 daily for 21 consecutive days, beginning five days after the onset of a menstrual flow (the first day of menstruation is counted as day 1), then discontinued for one week. If Ovulen is started later than day 5 after menses begins another method of protection is used until the first seven tablets have been taken. Subsequent 21-day courses are begun on the eighth day after the last tablet was taken in the preceding cycle. This three weeks on — one week off schedule is continued whether or not withdrawal flow has begun, flow has ceased or spotting or breakthrough bleeding has been experienced.

If one tablet is missed it is to be taken as soon as it is remembered and the next tablet at the usual time. If two consecutive tablets are missed the dosage is doubled for the next two days, then the regular schedule is resumed. If three consecutive tablets are missed a new tablet cycle is started on the eighth day after the last tablet was taken. For the best protection in the latter two instances instruct the patient to use another method of contraception until the next seven consecutive tablets have been taken. The possibility of ovulation increases with each successive tablet missed.

Postpartum administration — Non-nursing mothers may begin Ovulen immediately after delivery and nursing mothers after lactation is well established.

Ovulen-21®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

three weeks on...one week off

In the complex picture of moderate to severe anxiety...

there is a new reason for prescribing Mellaril (Thioridazine HCl)

effectiveness in mixed anxiety-depression

Long recognized for its usefulness in the treatment of moderate to severe anxiety, Mellaril is now also known to be effective against mixed anxiety-depression.

Often the symptoms of anxiety states are difficult to sort out—even with the most careful probing. The patient may manifest symptoms of agitation, restlessness, insomnia, somatic complaints. But what of the depression that may be mixed in the total picture? It is reassuring to know that Mellaril may be prescribed—with strong possibilities of success—when there is anxiety alone or a mixture of anxiety and depression.

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.
Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.
Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.
Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.
Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine hydrochloride). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

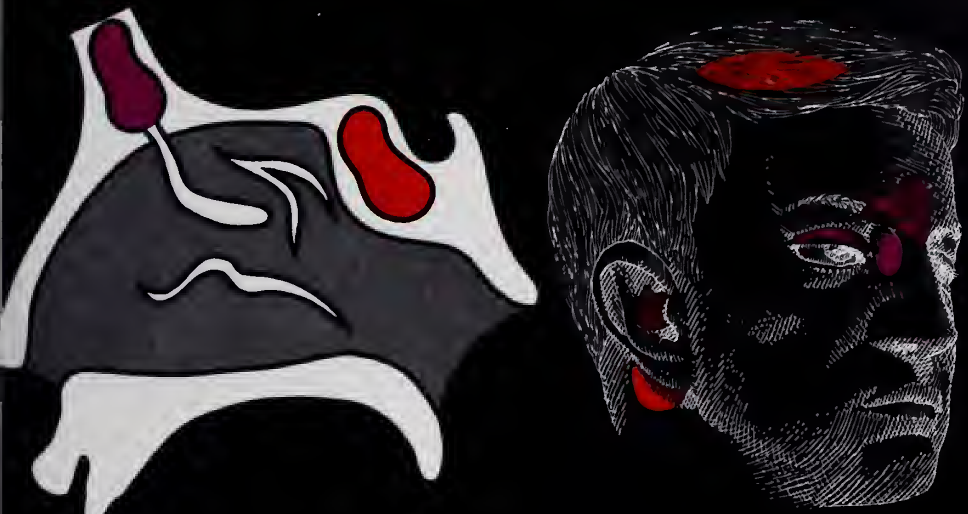
for moderate to severe anxiety and mixed anxiety-depression

SANDOZ SANDOZ PHARMACEUTICALS, HANOVER, N. J. 68-

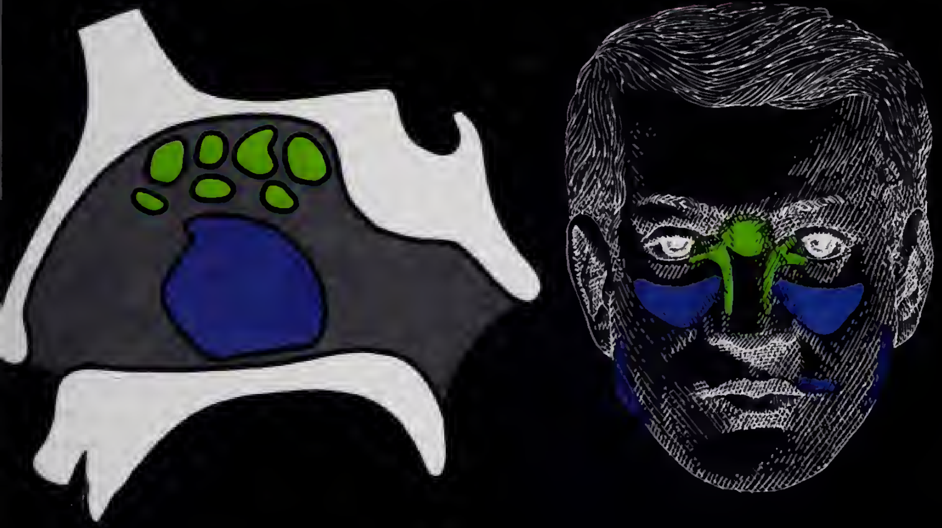
Sources of sinus headache



REGION OF SENSATION

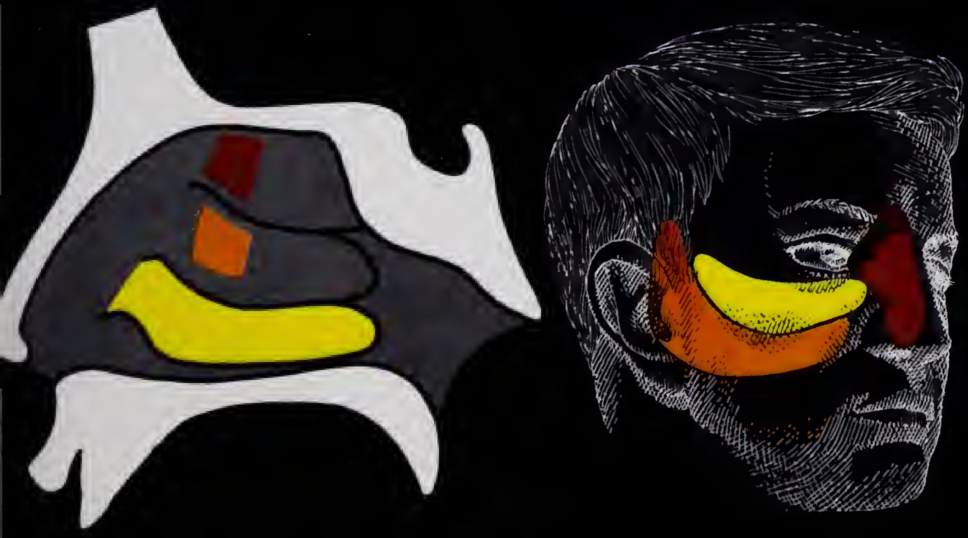
FRONTAL SINUS—headache localized over the frontal region, commonly beginning in the morning. Eyes painful to touch, may be slight swelling over eyes, puffy eyelids.

SPHENOID SINUS—most difficult to diagnose. Headache or sense of pressure over vertex. May be pain in ear or mastoid region.



MAXILLARY SINUS—headache and tenderness under eyes at top of cheekbones, usually starting in early afternoon. Possible swelling of cheek. Pain in jaw and back teeth.

ETHMOID SINUS—headache, tightness in upper part of bridge of nose and well down its sides. Pain, deep-seated behind the eyes and in inner corners of the eyes.



TURBINATES—pain along medial and lateral walls of the inside of the nose. Headache in frontal region, along supraorbital ridge, a feeling of fullness in the head.

Source of symptomatic relief

SINUTAB

Sinus headache is often a reflection of congestion in the nasal mucosa. The pain that results in the various regions of the head may help in determining the particular structure(s) responsible. The Sinutab formula is specifically designed for symptomatic relief of sinus headache and nasal congestion. **Sinutab** *not only* **provides an effective decongestant** — to reduce mucosal engorgement and facilitate freer breathing — *and* **an antihistamine** — to help reduce edema and excessive secretions — but it *also* provides, in contrast to other leading decongestants, two **analgesics** for immediate relief of pain and discomfort.

And, too, the Sinutab dosage schedule of 2 tablets, *q. 4 h.* permits controlled and continuing analgesic relief.

Adverse Reactions: Epigastric distress, drowsiness, dizziness, insomnia and nervousness.

Precautions: Instruct patients not to drive or operate machinery if drowsiness occurs. Use with caution in patients with thyroid disease, heart disease, hypertension, diabetes or kidney disease. Excessive dosage or prolonged use may cause kidney damage.

Dosage: Adults—2 tablets every 4 hours.

Each tablet contains 150 mg. acetaminophen, 150 mg. phenacetin, 25 mg. phenylpropanolamine HCl, and 22 mg. phenyltoloxamine citrate.

SPECIFIC FORMULA
SINUTAB®
FOR SINUS HEADACHE

Also Available on Prescription:

Sinutab® with Codeine.* Each tablet contains 15 mg. (¼ gr.) codeine phosphate (Warning: May be habit forming), 150 mg. acetaminophen, 150 mg. phenacetin, 25 mg. phenylpropanolamine HCl, and 22 mg. phenyltoloxamine citrate.

Sinutab® Pediatric Suspension. Each 5 ml. teaspoonful contains 300 mg. acetaminophen, 12.5 mg. phenylpropanolamine HCl, and 10 mg. phenyltoloxamine citrate.

*Subject to Federal Narcotics Regulations.

For 1 complimentary bottle of 30 Sinutab tablets, write: J. S. Travis, Warner-Chilcott Laboratories, Morris Plains, N.J. 07950. Please mention this journal.

LIKED MICHIGAN PHOTO ON MAY COVER

The May issue of *Michigan Medicine* featured a photograph of Lake Michigan on the cover in a salute to the annual Michigan Week observance.

The cover drew a letter from William S. Smith, M.D., head of the section of orthopaedic surgery at the University Hospital, Ann Arbor. He wrote:

"The attractive cover on the May, 1968 issue of the Michigan State Medical Society Journal is indeed a pleasant departure from the conventional "throw-away" look.

"There are so many beautiful scenes of Michigan available, that the journal should consider a different one for every cover." ☐

Rupture of Pregnant Uterus

ABSTRACT: The article is a summary of a 10-year survey of ruptured uteri compared with an earlier article covering the previous sixteen years. The incidence in the latter is higher than in the former. Reasons for the increased incidence are noted. The fetal mortality in the present series is lower and maternal mortality was nil. A plea is made for awareness of diagnostic possibility and need for immediate action.

HELEN S. YAP CHAI, M.D.
FRED F. BIRKAM, M.D.
J. WALTON PICHETTE, M.D.
EDWARD A. DOUGHERTY, M.D.

Rupture of the pregnant uterus remains one of the most dangerous of the life-threatening accidents during the childbearing age.

It is an even greater menace to the unborn infant. According to Eastman and Hellman,[8] this condition produces more than half of the maternal deaths in uterine hemorrhage and is responsible for approximately 5% of maternal deaths. Garnet[10] states that 68% of the perinatal mortality in the United States associated with uterine hemorrhage is caused by rupture of the pregnant uterus. Any physician who practices obstetrics is exposed to this unanticipated and often unforeseen complication. The symptoms are frequently obscure, so that by the time the physician recognizes the condition, it is calamitous.

This challenging state, which can occur to any obstetrical patient at any time, demands the utmost in skills by the physician to decrease the extremely high maternal and fetal mortality rates.

This survey was prompted by the continuous hazard the ruptured pregnant uterus presents to the mother, fetus and the attending obstetrician. A 10-year review was documented and compared with the study of Birkam, Dougherty and Pichette,[3] published from this hospital, as well as studies of other authors.

There were 50,658 deliveries reported in the last decade in which there were 18 uterine ruptures. This incidence of 1:2814 is comparatively higher than the report of 1:4466 in the first 16 years of study of ruptured pregnant uterus in this hospital but compares favorably with the incidences reported by other writers (Table 1).

THERE WAS A LARGER number of traumatic ruptured uteri in our series; 20% higher than the previous study (Table 2). The etiology of these uterine ruptures in the present survey and the reasons for the increase were one or more of the following:

1. The increased use of cesarean section to solve obstetrical problems
2. Increased use of oxytocins
3. Poor obstetrical judgment.

Before discussing the frequency of this condition, we must define "ruptured uterus." According

to Eastman,[8] it is a term to denote rupture only after the period of viability of the fetus, that is, 20 weeks or a fetus weighing 500 gm or more. The occult rupture or dehiscence is gradual in development and, as the name implies, is painless; whereas true ruptures are sudden in onset and almost always are associated with severe pain and shock. According to Kaltreider and Krone:[14] "Rupture is the separation of the entire uterine wall, with or without peritoneal involvement, associated with hemorrhage. Whereas dehiscence is not associated with hemorrhage and is often diagnosed at the time of elective surgery."

This study included only the cases with viable fetuses; our series ranges from 32-44 weeks with all occult ruptures.

Classification of the Causes of Ruptured Uterus

I. Rupture with previous scar
  A. C-Section
    1. Low transverse cervical C-Section — LCCS
    2. Classical C-Section
  B. Previous uterine surgery other than C-Section.

II. Rupture of Intact Uterus
  A. Spontaneous
    1. Associated abnormalities or diseases of the uterus
    2. Idiopathic
  B. Traumatic obstetrical procedures — forceps, breech extraction, version and extraction, pitocin or oxytocic induced labor, etc.

Case Review and Comments on Traumatic Ruptures

CASE 1. The patient was 24 years old, gravida III, para II, after 38 weeks of gestation in active labor with double footling presentation. Progress of labor was good for six hrs.; the cervix was 7-8 cm dilated when a prolapsed cord was noted. Breech extraction was performed under general ether anesthesia. A live girl weighing six pounds, 6 ounces was delivered. Examination of the uterus revealed a 3-4 cm laceration of the right lateral fornix and the right side of the cervix, extending about 7 cm into the fundus. A total abdominal hysterectomy was performed, and the patient received 1500 cc whole blood. Except for a low grade fever during the first four postoperative days, the postoperative course was uneventful. She was given Penicillin and Terramycin and was discharged on the 9th postoperative day.

Comment: There was proper management and diagnosis was established by immediate uterine exploration. The possibility of Duhrssen's incision might have been entertained.

CASE 2. The patient was 32 years old, gravida IX, para VII, and was seven months pregnant. Two weeks PTA, the patient had vaginal bleeding, weight gain, edema, elevated blood pressure and headache; fetal movements were absent. The patient went into spontaneous labor, after nine hours; a low forceps delivery was performed under spinal anesthesia. The head was delivered with ease, but when traction was made on the mascerated fetus, decapitation resulted. Evisceration was

The co-authors are all members of the staff of the Department of Obstetrics and Gynecology, Mt. Carmel Hospital, Detroit. Doctor Yap Chai is now in San Francisco.

attempted very carefully with a uterine dressing forceps, but failed. However, the trunk of the fetus was delivered by fundal pressure and a cervical laceration extending into the left broad ligament was felt on immediate exploration of the uterus. The patient had a subtotal abdominal hysterectomy. The blood pressure dropped to 60/30 during the procedure; otherwise, the postoperative course was uneventful. She received 1000 cc of whole blood.

Comment: Good postpartum management resulted since the diagnosis was established by immediate routine uterine exploration.

CASE 3. The patient was 30 years old, gravida VI, para V, at 39 weeks of gestation with a past history of orthopnea, ankle and pedal edema for four weeks. PTA. Her blood pressure was normal. Intravenous pitocin induction was given for three hours without commencement of labor. This was repeated 18 hours later, strong contractions started after 85 minutes. At this time a transverse presentation was noted with fast and irregular fetal heart tones. Pitocin was discontinued. Two hours later, contractions ceased and a slight drop in blood pressure to 90/64 was noted with severe abdominal tenderness and a slow fetal heartbeat. A Porro cesarean section was performed an hour later, and a six to seven inch rupture was found on the posterior aspect of the uterus. At laparotomy, a stillborn male fetus was found lying free in the abdominal cavity. The patient was in profound shock for 15-20 minutes. A cut-down was performed and Solu-Cortef and 2300 cc of whole blood were given intravenously. The postoperative course was uneventful.

Comment: The presentation of the fetus should have been accurately diagnosed prior to intravenous pitocin induction. Cesarean Section, if performed earlier, might have prevented the catastrophe to both the fetus and the mother.

CASE 4. The patient was 39 years old, gravida IV, para III, admitted at 41 weeks of gestation with false labor. Membrances ruptured spontaneously the following morning. A flat plate of the abdomen revealed a cephalic presentation. Quinine, gr X, was given; no contractions were noted. The following day, thick golden-brown amniotic fluid was seen, the patient was afebrile, intravenous pitocin induction was started. Contractions were every three minutes, lasting 35 seconds. After two hours, meconium stained fluid was noted. Vaginal examination showed questionable dilatation and undetermined presentation. Five and one-half hours after the intravenous pitocin was started, fetal heart tones ceased; the blood pressure was 90/50. Consultation was obtained and a subtotal hysterectomy with bilateral salpingo-oophorectomy was performed for rupture of the right posterolateral half of the uterus and cervix extending into the broad ligament, infundibulopelvic ligament and posterior parietal peritoneum. A dead male infant weighing seven pounds, nine ounces was found free in the abdominal cavity. The patient was in shock and received 2500 cc of whole blood.

Comment: If attention had been focused on the meconium stained fluid in a cephalic presentation with a near floating head plus irregular fetal heart tones, consultation would have been sought immediately and pitocin omitted.

CASE 5. The patient was 31 years old, gravida VI, para IV, abortus I, admitted at 39 weeks of gestation after spontaneous rupture of the membranes 1½ hours earlier. Quinine, gr X, was given and repeated four hours later. Eleven hours later she delivered, spontaneously a live boy weighing eight pounds, ten ounces. Immediately, the mother went into shock. Prompt exploration of the uterus revealed a long, deep laceration at the left lateral cervix extending into the lower uterine segment and uterus. Subtotal abdominal hysterectomy with right salpingo-oophorectomy was performed because of blood extravasated into the right infundibulopelvic ligament. She received 3000 cc of whole blood. The postoperative course was uneventful.

Comment: Diagnosis was established immediately upon routine uterine exploration.

CASE 6. The patient was 36 years old, gravida VI, para V, admitted at term in labor. Four and a half hours later, Pinard's maneuver was performed and a male infant weighing eight pounds, 13 ounces was delivered in good condition by breech extraction. Uterine exploration was performed with a negative result. About two hours later, a slight drop in blood pressure to 80/60 was noted, the pulse was 80 and regular; 1000 cc of 5% glucose in water was started. Four hours later, a mass the size of a football was palpated at the right adenxa. Supracervical hysterectomy with bilateral salpingo-oophorectomy was performed. A tear 5 cm long in the lower segment, extending into the right broad ligament with hematoma formation laterally and posteriorly to the right kidney was found. There was free blood in the peritoneum. The patient received 3500 cc of whole blood and 25 gm Mannitol and terramycin. She recovered uneventfully.

Comment: Importance of a thorough and careful uterine exploration is emphasized.

CASE 7. The patient was 33 years old, gravida VII, para VI, at 40 weeks in gestation with questionable labor and a transverse presentation, with the head to the right and the back inferior. External version was attempted and failed, but there was success on the second attempt with good fetal heart tones. A low forceps delivery under spinal anesthesia was performed after eight hours, followed by discovery of uterine rupture at the midportion of the lower uterine segment, extending into the fundus uteri approximately five inches. The tear curved somewhat to the left side and extended to within five cm of the tubouterine junction. Subtotal abdominal hysterectomy was performed with a right salpingo-oophorectomy; 1000 cc of whole blood was given. The postoperative course was uneventful.

Comment: Diagnosis again was rendered on routine uterine exploration. The advisability of external version may be controversial.

CASE 8. The patient was 39 years old, gravida IX, para VII, abortus I, after 40 weeks gestation and active labor for 11 hours. Breech extraction was executed with extraction of left nuchal arm under ether anesthesia. On routine uterine exploration, a posterior cervical laceration was found which extended into the right posterolateral side of the uterus with a hematoma in the right broad ligament. A supracervical hysterectomy with right salpingo-oophorectomy was performed. She was given 2500 cc of whole blood plus 4 cc of Levophed and calcium gluconate intravenously. The patient was in shock throughout the procedure. Her condition was fairly satisfactory until two hours later when moderate vaginal bleeding was noted and an exploration was made abdominally. A laceration 2 cm long was found at the right lateral aspect of the vagina and was repaired. The postoperative course was uneventful except for pulmonary congestion on the first day. She was discharged the 8th postoperative day with a hemoglobin of 9.9 gm.

Comment: Again, the diagnosis was obtained by immediate postpartum exploration of the uterus.

CASE 9. The patient was 44 years old, gravida XVII, para XV, abortus I, admitted after 40 weeks of gestation with contractions every three minutes and moderate vaginal bleeding; fetal heart tones were absent. A cytogram revealed no evidence of placenta praevia; ROT was station -3. Desultory labor for 14 hours was unimproved with intravenous pitocin. The uterus became tense; therefore, cesarean section was performed for primary uterine inertia and questionable marginal sinus rupture or abruptio placenta. A tear was found involving the whole thickness of the anterior myometrium, extending from the fundus to the bladder flap and hematomas were located in both adnexae. A stillborn male weighing eight pounds, fourteen ounces with intact membranes and pea soup thick amniotic fluid was seen. A subtotal hysterectomy with bilateral salpingo-oophorectomy was performed without blood transfusion. No complications were noted postoperatively.

Comment: Pitocin intravenously is contraindicated for a grand multipara and/or a floating head.

In the non-traumatic causes, the dictum "once a section always a section" still holds true, and this principle is followed by this department. An important example: a woman 25 years old gravida IV, para III, who had a cesarean section at her second delivery, for bleeding. She was allowed vaginal delivery with the third pregnancy. On the fourth admission, she was one week overdue and spontaneous delivery of a male infant weighing nine pounds, 13 ounces occurred in six hours. Immediate postpartum hemorrhage occurred. Exploration revealed rupture through the previous cesarean section scar. Subtotal hysterectomy was followed by uneventful recovery. She received 2500 cc whole blood for mild shock.

Maternal and Fetal Mortality Rates

In spite of the moderately higher incidence of uterine rupture in our series, it is gratifying to find a lower fetal mortality rate and the absence of maternal mortality in the present survey.

O'Driscoll and Quinn[14] pointed out that tear of a previous cesarean section scar may rank high in the list of causes of uterine rupture, but the maternal mortality rate is usually low (Table 3). In contrast, the maternal mortality rate in traumatic and spontaneous ruptures by comparison is high.

Factors Which Decreased Maternal and Fetal Mortality Rates

1. Early diagnosis — by immediate uterine exploration of all postpartum cases and especially those with previous uterine surgery, traumatic deliveries, pitocin induction, etc.
2. Early surgical intervention.
3. Adequate fluid, blood and drugs to combat shock.
4. Awareness of the dangers involved in traumatic obstetrical problems.
5. Use of antibiotics as indicated.
Diagnoses were rendered in both traumatic and non-traumatic cases:

a. In ten patients on routine uterine exploration with or without signs and symptoms of vaginal bleeding and/or shock. Of these, five presented with vaginal bleeding; seven were in shock.

b. One was diagnosed preoperatively as abruptio placenta, another as primary uterine inertia, and the third as impending uterine rupture.

c. Five were diagnosed because of palpable superficial parts and absence of fetal heart tones.

d. One was diagnosed at surgery.

These cases point out the importance of routine uterine exploration of all postpartum cases, especially following complicated deliveries, with or without external bleeding. The only exception, of course, is the case of gross intrauterine infections.

There were 7 fetal deaths and 11 live births among the 18 cases, which constitutes a 38.8% fetal mortality. However, one of the newborns died after 14 minutes in spite of resuscitation. Still, this figure is considerably lower than the average 68% fetal mortality rate in the United States. It is to be noted that the early diagnoses of ruptured uterus, good surgical technique and early institution of shock therapy, resulted in no maternal mortality and a considerable lowering of the fetal mortality rate.

Treatment consists of total abdominal hysterectomy with or without salpingo-oophorectomy in seven patients, subtotal hysterectomy in nine patients and two cesarean sections with repair of the ruptured area in two patients.

TABLE 3

Summary

1. Eighteen cases of ruptured uterus occurring between 1956-1965 have been reviewed.

2. A comparison was made of the incidence of 1:2814 with that of other authors and our previous study.

3. Traumatic ruptures rank highest in the list, constituting 50% of all cases.

4. No maternal mortality was encountered.

5. Fetal mortality rate was 38.8%, lower than the average.

6. Treatment of ruptured uterus is presented.

7. A serious plea for routine exploration of the postpartum uterus is emphasized.

8. Traumatic ruptures can be avoided, in part, by more zeal and watchfulness on the part of the physician.

9. Early diagnosis decreases maternal mortality, morbidity and fetal mortality.

Editorial Note:

Obstetrics usually represents one specialty in which the end result usually leads to happiness on the part of all parties involved. Ruptured uterus is a catastrophe that is life-threatening to both mother and child and causes dismay in an otherwise happy situation. As the authors point out, the obstetrician should keep this possibility in mind and be ready for immediate intervention.

Atypical Mycobacteria In the Detroit Area

ABSTRACT: The classification of the atypical mycobacteria is reviewed. Clinical disease in the Detroit area is most frequently due to Type III. Type II (Scotochromogens), almost always a non-pathogen, is the most common organism isolated.

BY OSCAR BIGMAN, M.D.
MORRIS F. WHITE
BOTH OF DETROIT

Although the atypical mycobacteria have been known for many years and the main identifying features classified by Runyon,[1] subclassification is still in process.[2, 3] Table I indicates the current but tentative classification. Organisms occasionally tall between the categories and are difficult to place specifically.

Organisms in the left hand column are considered pathogenic.

It was thought worthwhile to review the experience within the Detroit area to guide clinicians as to which organisms may be found in the vicinity and as to which ones may be difficult to treat.

A previous paper by R. A. Green[2] presents the only source of information previously available as to cases found in the State of Michigan. All the organisms were collected either in the Out-Patient Clinic or on the In-Patient Service at Herman Kiefer Hospital between Jan. 1 and Dec. 31, 1965. Out-patient records were not reviewed in detail since many of the sputa were submitted by patients under the care of private physicians and the clinical information available was inadequate.

A total of 479 out-patient sputa were positive for atypical organisms. There were 459 isolations of Group II, one of Group III, nineteen of Group IV. M. Kansasii (Group I) was never found.

Table II indicates the relative frequency with which M. tuberculosis and atypical mycobacteria were found. It will be noted that in the outpatient services atypicals were found more frequently than "typicals." Of course, most of these were Group II, non-pathogens.

Table III indicates the nature of the disease in patients whose sputa contained Type II-scotochromogens.

TABLE I — CLASSIFICATION

Runyon Group I	Photochromogens	
M. Kansasii		
Runyon Group II	Scotochromogens	
M. Scrotuloceum		tap water (aquae)
Runyon Group III	Nonchromogens	
Battey bacillus		M. Terrae
M. Avium		M. Gastri
M. Xenopei		
Runyon Group IV	Rapid growers	
		M. Fortuitum
		M. Phlei

TABLE II
SUMMARY OF ALL SPUTA SUBMITTED TO THE LABORATORY IN 1965

	Inpatient		Outpatient	
Negative for AFB	11,906	84.6%	11,958	91.1%
Positive for M. tuberculosis	2,007	14.3%	186	1.4%
Positive for atypical mycobacteria	102	0.7%	479	3.6%
Contaminated	51	0.4%	510	3.9%

Both authors are associated with the Herman Kiefer Hospital, Detroit.

TABLE III — IN-PATIENTS

Group II Scotochromogens only isolated		
benign non-progressive disease	isolated once 12 patients	more than once 2 patients
pneumonia clinically	isolated once 3 patients	more than once 1 patient
patient expired	isolated once 6 patients	more than once 1 patient
Group II **and** M. tuberculosis isolated	isolated once 16 patients	more than once 4 patients

Single isolates of Group II were obtained from three patients with bronchiectasis, one with pneumoconiosis, one with sarcoidosis.

The out-patient experience shows that there are many Group II Scotochromogens isolated in the Detroit area. Whether in the clinic with an insignificant lesion, or whether admitted with a more suspicious lesion, these Scotochromogens (aquae) are benign. Sometimes they appear coincidentally to a mycobacterium tuberculosis infection, in which situation they do not seem to alter the prognosis. They are probably contaminants derived from soil and water where they are commonly found. Occasionally cavitary disease is found. It is difficult at this time to know whether this represents a different strain (scrofula) or host resistance deficiencies.

The isolation of Group IV, rapid growers, M. Fortuitum or M. Phlei also seems clinically benign in our limited expreience.

On the other hand, the isolation of Group III, Battey bacillus, seems to carry a grave prognosis, our two patients showing inexorable progression to death.

These observations agree with the general consensus that Groups I and III are pathogenic and that the exact role of Groups II and IV are yet to be established. Further subdivision of Groups II and IV into laboratory distinct strains are needed.

CASE HISTORIES

1. (46054)

R. K., A 71-YEAR-OLD WOMAN was admitted on July 30, 1964 and expired on July 4, 1965. She had noted progressive dyspnea for 3 or 4 years, productive cough for 2 months, hemoptysis for 1 week. She had lost 20 lbs. in the previous year. She complained of night sweats for the previous 2 months.

TABLE IV

Group III	Battey	
	R.K.	Patient expired. The organism was isolated on eleven occasions.
	W.A.	Patient expired. The organism was isolated on ten occasions.
Group IV	M. Fortuitum	
	M.R.	Cystic disease of lung. Organism isolated once.
	F.H.	Recurrent migrating pneumonia. Organism isloated once.
	D.C.	Right middle lobe pneumonia. Organism isolated once.
	J.R.	"Classic" tuberculosis. M. Hominis isolated on five occasions. M. Fortuitum on one occasion.
	H.B.	Pneumonia in patient with carcinoma of the lung. M. Fortuitum isolated on one occasion.

In one patient, S.D., who clinically had silicotuberculosis, the organisms were apparently variable in cultural characteristics, being classified as I, twice; II, twice; and IV, three times.

Past History: Glaucoma for eleven years, treated with iridectomy, on the right. A daughter had had tuberculosis 15 years ago.

Physical Examination: Iridectomy, right eye. Lungs — moist rales at right base, soft apical systolic murmur. 1+ pedal edema.

Sputum cultures were always positive for mycobacteria Type III. X-rays showed slow progression. The patient became gradually more dyspneic and anemic. She was treated with isoniazid, streptomycin, P-amino-salicylic acid. Erythromycin added later, failed to alter the course of the disease.

2. (45356)

W. A., A 50-YEAR-OLD MAN was admitted on December 27, 1963 and expired on July 15, 1965. He had had bronchial asthma, non-seasonal, since the age of 18. Ten months prior to admission, he had developed a productive cough and weakness. He denied weight loss, fever and night sweats.

Past History: Heavy smoker and drinker. Occupation — janitor.

Physical Examination: Not remarkable except for absence of teeth, an increased A-P diameter of the chest and bronchial breath sounds in the left infraclavicular region.

Hospital Course: The patient was treated with streptomycin, isoniazid, P-amino-salicylic acid from 12/30/63 to 1/30/65. X-rays improved but the sputum remained positive for atypical mycobacteria. There was difficulty in classifying the organisms. On 4 occasions they were considered to be Group III and on 6 occasions, Group IV. In January, 1965, the combination of ethionamide, cycloserine and isoniazid were started. The X-rays began to show deterioration in the Spring of 1965. The patient expired quietly on July 15, 1965.

3. (43962)

S. D., A 75-YEAR-OLD MAN was admitted on October 12, 1965 for hemoptysis on two occasions. He had had a "cold" with cough and soreness of the left chest for about three weeks. Weight loss, fever and sweating were denied. Past history revealed that the patient had been a foundry worker for 27 years. He smoked 10 cigars a day. The main finding on physical examination was the presence of cavernous breath sounds in the left apex. On isoniazid, P-amino-salicylic acid, streptomycin and pyrizinamides, the cavity became smaller. The patient was discharged as "open negative" on May 27, 1965. Sputum was positive for atypical tubercle bacilli on seven occasions. The organisms were varibly identified as being of Group I, II and IV.

He was readmitted on March 12, 1967 for minor X-ray progression of his pulmonary disease. The intermediate PPD skin test produced an 11 mm. area of induration. Atypical mycobacteria were again isolated. The patient expired on May 24, 1967, following a transurethral resection, apparently of uremia.

ACKNOWLEDGEMENT

The assistance of Paul Chapman, M.D. and Isidore Selzer, M.D. in making available the charts and laboratory data herein reported, is gratefully acknowledged.

Editorial Comment:

In the past many people were hospitalized in tuberculosis sanitoria for nontuberculosis lesions. Seldom today do we see hospitalization for tuberculosis with such conditions as sarcoid and histoplasmosis. However, the atypical mycobacteria can still be a fooler. It is also interesting to note that not all atypical mycobacteria are innocuous. JWM.

The Programmatic Aspects of The Michigan Regional Medical Program

BY ALBERT E. HEUSTIS, M.D., M.P.H.
EAST LANSING

The establishment of a special President's Commission and passage of Congressional legislation regarding cancer, heart disease and stroke will give great impetus to the efforts of sharing the knowledge of treatment of these diseases.

The Commission has submitted a report which includes the following two quotations:

> FIRST — "A significant number of Americans with these diseases (cancer, heart disease and stroke) die or are disabled because the benefits of present knowledge, in the medical sciences, are not uniformly available throughout the country."
>
> SECOND — "A creative partnersip must be forged among the Nation's medical scientists, practicing physicians, and all of the Nation's other health resources, so that new knowledge can be translated more rapidly into better patient care. This partnership should make it possible for every community's practicing physicians to share in the diagnostic, therapeutic and consultative resources of major medical institutions."

Then, in the opening section of Public Law 89-239 itself, we find the purposes of the legislation defined as follows:

> "Sec. 900. The Purposes of this title are —
> (a) "Through grants, to encourage and assist in the establishment of regional cooperative arrangements among medical schools, research institutions, and hospitals for research and training (including continuing education) and for related demonstrations of patient care in the fields of heart disease, cancer, stroke, and related diseases;
>
> (b) "To afford to the medical profession and the medical institutions of the Nation, through such cooperative arrangements, the opportunity of making available to their patients the latest advances in the diagnosis and treatment of these diseases; and
>
> (c) "By these means, to improve generally the health manpower and facilities available to the Nation, and to accomplish these ends without interfering with the patterns, or the methods of financing, of patient care or professional practice, or with the administration of hospitals, and in cooperation with practicing physicians, medical center officials, hospital administrators, and representatives from appropriate voluntary health agencies."

On the basis of these statements, what then is the involvement of the local physician in the Michigan Regional Medical Program?

INVOLVEMENT OF LOCAL PHYSICIANS

Everywhere along the line and at every level of policy and program development, the local physicians of the state have been well represented:

1. At the level of absolute control over what is submitted to Washington for funding, there are five local physicians on the Regional Advisory Group.
2. At the level of the Board of Directors who govern the affairs of the Corporation, there are two local physicians.
3. In the Professional Advisory Councils:
   Heart Disease has seven.
   Cancer has nine.
   Stroke has five.
4. On the Task Forces:
   Incidence and Prevalence has one.
   Continuing Education has three.
   Compatability of Educational Media has one.
   Methods and Evaluation has two.
5. Less active perhaps so far but with great potential for the future are the local physician representatives on the local advisory committees of our great universities.
6. We are asking that all those involved in the planning of projects be clearly identified in order to emphasize the need for the potential receivers — the learners and users of the in-

---

Presented at the First Annual Conference for Michigan Health Planning, Detroit, February 23, 1968.

formation — to be involved in the development of those things designed to serve their local needs.

7. In our embryo State Plan, approved as a working document upon which to request funds, we see our medical centers working with local physicians in larger hospitals and we see those local physicians in turn — in ways acceptable to both — involving local physicians in smaller or community hospitals along the line of usual patient referral.
8. This Planning Conference represents the second time that officials and staff of the Michigan Regional Medical Program have been invited to present material to an official Michigan State Medical Society gathering and in addition the staff has met individually with a number of MSMS Committees and participated in an official MSMS called meeting to which the chairmen of all Medical Society Committees believed relevant were invited.

CURRENT STATUS

The Michigan Association for Regional Medical Programs has operated under a planning grant since June 1, 1967 — a relatively short period of time. While the University of Michigan initiated activity in July, other participants and the Central Office itself did not get staffed until the last quarter of 1967.

During this time the Central Office has:

1. Become organized and located.
2. Developed three Professional Advisory Councils, four Task Forces and two Ad Hoc Committees and provided staff work therefor.
3. Assisted those with an interest in developing programs.
4. Reviewed and made recommendations on projects submitted by the University of Michigan, the Michigan Heart Association, Michigan State University, Wayne State University, Michigan Department of Public Health and the Zieger/Botsford Hospitals.
5. Cooperated with the State of Michigan in the early planning phases of the development of the State Office of Comprehensive Health Planning.
6. Developed working liaison with the Minnesota and Wisconsin Regions regarding those problems of mutual interest.

The Michigan Department of Public Health has made a start on planning and developmental work and is developing a system of coordinated data collection and anaylsis to insure the comparability of all data collected in the region.

The University of Michigan has been doing central planning and coordination, trying to plan a Cancer Chemotherapy project, developing a program for Post Graduate Education of Nurses, establishing a Drug Therapy Information and Drug Therapy Analysis Reporting System and has started to plan for the training of non-professional personnel.

Michigan State University has established a Planning and Facilitating Office, and Wayne State University is getting started in the planning area, having just engaged their first personnel as of February of this year.

THE 1968-69 FEDERAL FUND REQUEST

Future activities include the projects which were approved by the Corporation's Regional Advisory

THE AUTHOR

Doctor Heustis, former director of the Michigan Department of Public Health, is the director of the Michigan Association for Regional Medical Programs (MARMP).

Group on February 2, 1968, and which have been sent to Washington for consideration of Federal funding.

Briefly summarized this project request consists of:

1. A central planning and administrative staff.
2. Planning staffs for the University of Michigan, Michigan State University, Wayne State University and the Michigan Department of Public Health.
3. The planning and initial development of an on-going population survey which will assess the state of health, provide up-to-date rates for small areas for morbidity and mortality, pinpoint populations and areas of concern and provide information on patterns of utilization of health services.
4. The development of an approach to automated screening.
5. A survey which will assess physicians' attitudes with respect to continuing education.
6. The development of a physician education program primarily for osteopathic physicians.
7. Community training programs for physicians and nurses in coronary care concepts.
8. Continued education for nurses, both at the universities and in the field.
9. Development of a system to provide drug information to physicians.
10. The study of ways in which to utilize and train non-professional personnel.
11. The evaluation of medical care services from the viewpoint of the patient and the planning for indicated improvements.
12. The planning of a continuing education program for dentists to improve services to patients with cancer, heart disease and stroke.
13. The planning for a community program for the management of stroke.
14. Assessment of the needs of low income populations.
15. Initiating a training program concerned with the diagnosis of hypertension.

CONCEPTS AND PRINCIPLES

Concurrently with the planning and development proceeding in some of our institutions, the Central Office has been working with the Professional Advisory Councils and Task Forces to develop general concepts and principles to guide staff action in the stimulation, development and review of project applications. These are presented here as an integral part of the emerging plan for Michigan's Regional Medical Program.

1. The goal of the Michigan Regional Medical Program is to advance the accessibility and the quality of health services available to individual patients throughout the region through regional arrangements designed to stimulate new patterns of cooperative action among physicians, hospitals, university medical centers, public health and voluntary health agencies.
2. In addition to universities, a wide range of health related community, district and statewide agencies will be encouraged to develop projects with the provision that applicants must have the ability to take full fiscal and operational responsibility for projects developed and have recognized competence in the area of concern or a demonstrable potential.
3. Projects to be considered for funding cannot be isolated activities but must relate to the overall development of Michigan's Regional Program.
4. In general, projects must provide for some immediate relevance for the improvement of patient care or for better utilization of manpower.
5. Projects must have as an objective the making of a practical contribution to the effective diffusion of knowledge throughout the region and to the lessening of the gap between knowledge and practice as it affects the care of individual patients. They should have some immediate impact in communities and hospitals not now affiliated with the medical schools and should be programmed to be geographically inclusive with an indication of the phasing anticipated for total coverage.
6. Projects must identify specific working interrelationships and cooperative arrangements that have been developed or anticipated with other agencies.

7. Patient care demonstration projects must either be replicable elsewhere in the region or have a clearly defined impact throughout the region on physician capability through training.

8. Projects will be concerned with those aspects of the subject diseases and of the health care system in which input of funds will result in maximum benefit in improving the care of individual patients.

9. Funding of projects relating to the care of low income urban groups will be encouraged.

PROCEDURES

To implement these principles, a consistent approach has been defined which, incorporated in the majority of projects funded, will organize what might otherwise be disconnected activities into a regional program.

1. Inasmuch as group consensus can be more effective in changing behavior than individual learning, the primary target for a decentralized approach to improved care of patients is the hospital staff.

2. Working with hospital staffs will be undertaken in conformity with a logistic regionalization concept whereby smaller or community hospitals relate along patient referral lines to larger district (sub-regional) hospitals or hospital centers and these in turn relate to a university medical center.

   The role of the medical center in a decentralized approach should be to work through larger or district (sub-regional) hospitals or hospital centers and their staffs, which in turn accept the responsibility for the involvement within their normal area of patient referral, of the smaller community hospitals and their staffs.

   Thus, a well organized district hospital (with a specialist staff and director of medical education) functioning as a training and service center will serve as a communication link between university and community hospitals, lessening the gap between knowledge in university medical centers and practice in community hospitals.

3. In all programs designed to improve patient care in order to have maximum impact, the effort should ideally be multi-disciplinary, providing for interrelated training of physicians, nurses and other personnel.

4. All applications must include specific assurances that continuing education offerings will be available to all medical and osteopathic physicians in the area regardless of hospital affiliation.

5. All projects will contain clearly stated objectives capable of realistic evaluation.

THE EMBRYO STATE PLAN

Within these principles and procedures, our embryo State Plan is as follows:

HEART DISEASE. Each district hospital or district hospital center will be encouraged and otherwise assisted in reviewing current practices regarding the handling of patients with acute coronary disease and wherever indicated will be assisted in developing and implementing an adequate concept of cardio-vascular care which will fit into its particular circumstances, with said district hospital or district hospital center and the medical staff thereof (with needed assistance from a medical school) accepting the responsibility of working with the smaller or community hospitals within its referral area, so that available new knowledge may be received in a fashion that will facilitate the improvement of patient care at the community level.

At least one training program in acute coronary care will be made available to each district hospital or district hospital center with the involvement of one or more community hospitals in each district area.

Comprehensive programs for the medical management of persons with hypertensive disease will be developed in the same way, with the district hospital or district hospital center serving as a resource for those medical specialties, diagnostic studies and treatment facilities not available at the community hospital.

STROKE. Comprehensive program for the medical management of stroke patients will be developed in the same manner as for heart disease and will include the pre-stroke phase on through the continuing care of post-stroke patients in long term care facilities, in their own homes or in nursing homes.

CANCER. Each district hospital or district hospital center will be encouraged and otherwise assisted in reviewing current practices in the primary diagnosis and treatment of patients with cancer, and wherever indicated will be assisted in developing an adequate program for the primary diagnosis and treatment of cancer patients.

With the help of, and the involvement of the medical staff of its district hospital or district hospital center, each community hospital will assess its own potential for the primary treatment of cancer taking into consideration the availability of specialist personnel and adequate diagnostic and therapeutic equipment, including nuclear medical components, and will determine a proper scope of services for itself and a proper relationship for patient referral between it and the district hospital or district hospital center.

With the assistance of a university medical school, each district hospital or district hospital center will develop competence in the curative and/or palliative aspects of cancer chemotherapy, and, through mutually worked out and acceptable mechanisms, share such knowledge and make its facilities and competencies available to the community hospitals in its area.

APPLICATION INFORMATION

Any group wishing to make an application to participate in Regional Medical Program funding by establishing a **cooperative working arrangement** may get started by just writing the staff a relatively brief letter outlining what they have in mind and with whom they plan to work cooperatively and sharing whatever information they have on timing and on costs. This will serve as a basis for initial staff discussions on a sub-regional or district hospital basis and after this, if feasible, a formal application may be prepared. We are at the present time seeking eight energetic men or women in the 10,000-14,000 dollar class to work in local areas to assist in project development.

THE VOLUNTARY NATURE OF THE PROGRAM

As a concluding note, everyone should be reminded that this is a **voluntary program** and that all goals and concepts herein discussed are most certainly subject to such modification or change as may be necessary to enable physicians to receive such help as they would like to receive and to receive this help in an acceptable and useable fashion. □

Office Management Seminar In Detroit, September 26

One of the features on the program of the MSMS Annual Session will be a Seminar on Office Management, on the afternoon on September 26, designed especially for newly-practicing physicians, residents, interns, senior medical students, and the interested wives.

The MSMS Liaison Committee with Residents, Interns, and Senior Medical Students, under the chairmanship of Norman Henderson, M.D., East Lansing, has developed a program to have maximum value in helping young Michigan physicians set up their practices according to flexible and efficient management principles.

Merck, Sharp, and Dohme pharmaceutical company is providing financial support for the seminar and will provide a special Office Management Handbook for participants in the seminar.

Michigan professionals who work closely with physicians in the business side of their practice will share their experience and counsel with the young doctors. Charles V. Brown, of Detroit, will speak on "Personnel Selection and Training;" C. Allen Willmar, Saginaw, will discuss "Setting Up Practice;" John K. Hoffman, Grand Rapids, will discuss solo practice and the various forms of partnership arrangements; R. Timothy Hogan, Ann Arbor, will speak on "What Shall I do With the Money I Earn;" and Carl King, Jr., Saginaw, on "Billing and Collection Systems." The first four speakers mentioned are all members of Black & Skaggs Associates, a Michigan firm which has been involved in professional management for physicians and dentists since 1932. Mr. King handles a billing and collection system for physicians in the Saginaw area.

Helps Dedicate School Named for Grandfather

Main speaker at dedication exercises of the Dr. Samuel A. Mudd Elementary School in Waldorf, Maryland, was Richard D. Mudd, M.D., of Saginaw, the grandson and only living physician descendant of Doctor Samuel Mudd, who lived from 1833-1883.

Doctor Richard Mudd, retired after 36 years as medical director of various divisions of General Motors, keeps busy by helping out several physicians and acting as a consultant.

WSU HONORS HALE

Ten Wayne State University professors with a combined total of nearly 300 years at the University were honored at the Service Recognition Tea June 16. The group included Esther H. Dale, M.D., Detroit, professor of pathology, 38 years.

State to Continue Study of Medical Education, Needs

The study of Michigan's educational programs for medical and allied health personnel will be continued by the Michigan State Board of Education, thanks to a recent grant of $98,680 from the W. K. Kellogg Foundation of Battle Creek.

In the past two years the Committee has been inventorying existing health manpower resources and educational capacities of the state to alleviate existing deficiencies and to plan for future needs.

Edwin L. Novak, of Flint, State Board of Education President, said that the grant will be used to subsidize salaries of the Committee's staff for two years, providing for a project director and assistant, two researchers and staff travel as well as office equipment and supplies.

In addition to working on a state plan for adequate health care education facilities, the 17-member Committee will help develop demonstration projects in allied health education such as medical technology and para-professional fields.

Thoughts of MD-of-the-Year:

In 1965, MSMS cooperated with the Michigan Tuberculosis and Respiratory Diseases Association to present Irvine H. Page, M.D., who was selected by the AMA in San Francisco as the "Outstanding Physician of the Year." Doctor Page, formerly with the Cleveland Clinic and now retired and living in Indianapolis, presented many provocative points in his 1965 Yates Address at MSU. His comments included these:

"Uncertainty lies now in what we are going to do for people, why we want them here and how long we want them alive.

"The last 40 years of science have done more to change our lives than all the rest of recorded time.

"More obesity begins at the family dinner table with children than ever originates later on.

"We are hereditarily conditioned organisms trying throughout our lifetimes to adjust to a hostile environment."

FIRST DO ADMITTED

Recently osteopathic physicians were offered full staff privileges at Sparrow, St. Lawrence and Ingham Medical hospitals in Lansing, and Ann Agustsson was the first osteopath admitted to the staff at Ingham Medical. She is a graduate of MSU and the Chicago osteopathic school.

MSMS RELEASES PUSH CAREERS IN HEALTH FIELD

High school graduates have been urged by MSMS news releases to consider health careers. In addition to describing the needs, MSMS President Bradley Harris, M.D., outlined a variety of health careers.

The news feature was headlined many ways. Among them:

Stockbridge Town Crier & Brief Sun: "High School Students Urged to Consider Medical Career"

Cedar Springs Clipper: "Many Opportunities in Field of Health"

Pioneer Press, Bear Lake, Manistee County: "More Medical Personnel Needed Everywhere"

Detroit East Side Express: "Seniors Urged to Consider Careers in Medical Field"

Farmington Enterprise & Observer: "Skilled Help Short In Health, Medicine"

Dimondale News: "Students Urged to Consider Medical Career"

Michigan Chronicle, Detroit: "Cite Unlimited Health Careers"

Livonia Observer: "Skilled Help Short in Health, Medicine"

Ingham County News: "Students Urged to Consider Medical Careers"

Montague Observer: "High School Students Urged to Take Medical Courses"

KAHN LEAVES U-M, JOINS HOWARD

Reuben L. Kahn, M.D., noted professor-emeritus of serology in the University of Michigan's Medical School, recently took over new duties as professor of microbiology at Howard University in Washington, D.C.

Previous to his new appointment, Doctor Kahn had been doing research at the U of M Kresge Medical Research Building and acting as research consultant in dermatology on the University staff.

Doctor Kahn achieved world renown when he developed a serological test for syphillis in 1923.

Doctor Kahn, who had been at the University of Michigan since 1928, was named to the Michigan Health Hall of Fame in 1965.

USPHS HELPS MSU

The federal government has granted $2,534,035 to Michigan State University to support construction of a $10 million Life Sciences Building for medical teaching.

The Michigan Legislature recently authorized $1 million for initiating construction with the understanding that an additional $3 million will be needed over the following two years. The Kellogg Foundation has granted $625,000 to support the construction.

Work is expected to begin this fall.

MSMS HELPS AREA REHAB CONFERENCE

About 100 physicians and interested lay people participated recently in an area Conference on Rehabilitation and Long Term Care of Elderly Patients at Saginaw County Hospital.

Sponsored by the MSMS Committee on Aging, Bay, Midland, and Saginaw county medical societies, and the Saginaw Veterans Administration Hospital, the conference dealt with both the professional and administrative problems related to rehabilitation and long term care of the elderly.

Chairman of the MSMS Committee on Aging, A. Hazen Price, M.D., Detroit, presided at the dinner which closed the conference.

New Rates Set For Nursing Homes

New rates for State payments to nursing homes under State-Federal medical assistance programs were set today by the Departments of Public Health and Social Services. The new rates, effective July 1, will be in force until June 30, 1969.

Reimbursement for facilities providing skilled nursing care will be $14 a day; those providing basic nursing care will receive $11 a day. Current rates are paid at four levels, from $10 to $16 per patient day, depending on the level of care.

The new rates are interim fees pending studies during the year based on standardized cost accounting. State categorization of nursing homes under proposed administrative rules, and reassessment of levels of care required by individual patients.

The Department of Social Services administers the assistance programs, but the Department of Public Health, under contractual agreement, sets daily reimbursement rates.

(From the Michigan Report by the Gongwer News Service.)

Doctor-Nurse Conclave Planned

The MSMS Committee on Nursing will sponsor an invitational Conference for Physicians and Nurses with an emphasis on "Strengthening Nurse-Physician Relationships" at the Michigan Education Association Conference Center at St. Mary's Lake near Battle Creek, Sept. 4-5.

HELPS SMOKING COUNCIL PLAN GP WORKSHOP

Oscar D. Stryker, M.D., Mt. Clemens, will represent MSMS on the planning committee for the Michigan Academy of General Practice Workshop on Smoking and Related Disease at MSU October 20.

MAGP has requested MSMS and the other organizational members of the Michigan Council on Smoking and Health to help plan the physician workshop.

SWEENY COMPETES IN TV BOWL QUIZ

Michigan participant in the "Medical Bowl Quiz," one of the unique features at the recent AMA Convention in San Francisco, was Donald N. Sweeny, Jr., M.D., Detroit.

Four teams, of three members each, competed with one another in giving quick answers to questions in the field of politics on a televised show. "Our team lost by two points, and the team which beat us went on to win the contest, so we didn't feel too bad about our showing," Doctor Sweeny commented.

REPRESENTS MSMS

A. C. Stander, M.D., Saginaw, represented MSMS at the recent annual convention of the Michigan Hospital Association. Doctor Stander, Saginaw, is a member of The MSMS Council.

OFFICIAL CALL

The Michigan State Medical Society will convene in Annual Session in Detroit, Michigan, September 22-26, 1968. The provisions of the Constitution and Bylaws and the Official Program will govern the deliberations.

BRADLEY M. HARRIS, MD
President

ROBERT J. MASON, MD
Council Chairman

JAMES B. BLODGETT, MD
Speaker

VERNON V. BASS, MD
Vice Speaker

Attest:
Kenneth H. Johnson, MD, Secretary

Consumer Price Increases in Health Less Than Year Ago

In the past few years consumer prices have displayed an even sharper advance because of the greater importance in the index of the cost of personal services, retail distribution, and other activities with a high labor content. April consumer prices were 4.0% higher than a year earlier, in contrast to the advance of 2.5% in the preceeding twelve months. The 1967 increase in consumer prices was the sharpest year-to-year rise in over 16 years.

Although hospital daily charges rose approximately 21.0% from March 1966 to March 1967, the following period (1967-68) only showed an increase of approximately 16.0%. Physicians' fees showed approximately a 10.0% rise during the period March 1966 to March 1967, however, the following period (1967-68) only showed a 4.0% increase.

In general, inflationary pressures are forecasted to persist in the months ahead with consumer prices continuing to increase.

Interested MSMS members can find detailed information in the June, 1968 issue of *Monthly Economic Letter,* published by the First National City Bank, New York; and from the monthly Consumer Price Index of the U. S. Bureau of Labor Statistics.

TO STUDY NURSING NEED

A joint study of Michigan's nursing education needs has been given approval of the State Board of Education. The study will be conducted by the Department of Medical Care Organization in the University of Michigan's School of Public Health and financed primarily through $50,000 of the Governor's Commission on Comprehensive Health Planning.

Leaves WSU Vice-Presidency, Scott to Travel, Teach Again

At the end of July, Gordon H. Scott, Ph.D., will leave for a three-month period of independent research in the fields of histology and electron microscopy at the University of British Columbia, following his recent retirement from the post of Vice-President for Medical School Development at Wayne State University.

"In his 23 years of distinguished service to the University," said WSU President William R. Keast upon announcing the retirement, "Doctor Scott has played a major part in making the Medical School one of the finest in the nation." After his work in British Columbia, Doctor Scott will continue his study for three months at the University of Washington, and for six months at Stanford University.

HE WILL THEN RETURN to Wayne State for a year of teaching in the department of anatomy. "I have been out of the classroom for more than 10 years and will look forward to going back," he commented.

Doctor Scott came to WSU in 1945 as a professor and chairman of the department of anatomy, served as Dean of the Medical School from 1950 to 1963, and from 1961 to the present he had served as Vice-President for Medical School Development.

DURING HIS TIME AT the school not only was the current building constructed, but definite plans were made for the new $56 million medical complex covering 25 acres of land near Grace and Harper Hospitals.

The groundbreaking last January of the $23.5 million Basic Science Building is considered by Doctor Scott as the "most gratifying experience" of his service to WSU.

"This made the relationship between the Detroit Medical Center and the University an assured thing," he said. "There was no turning back."

BESIDES HIS WORK AT the medical school, Doctor Scott served as president of the Michigan Health Council in 1963.

TO SURVEY FEES IN WAYNE COUNTY

MSMS Council recently approved a request from the Wayne County Medical Society that the MSMS Committee on Medical Socio-Economics, under the chairmanship of Dale L. Kessler, M.D., Grand Rapids, conduct a survey of fees by specialty and type of practice in Wayne County.

The survey will begin late this summer, will be of significant value to physicians not only in Wayne County, but throughout Michigan.

Council Selects Financial Board

The MSMS Council recently appointed a five member Board of Managers whose duty will be "to invest, re-invest, buy, sell, trade or otherwise, acquire, dispose of or manage Society assets assigned to its care with the objectives of achieving a combination of growth income and stability," according to the official Council minutes.

Appointed to the Board were MSMS Treasurer John R. Ylvisaker, M.D.; MSMS Finance Chairman Robert K. Whiteley, M.D.; C. Allen Payne, M.D., and Ross V. Taylor, M.D., members of The Council, and Thomas H. Wagner, investment counselor.

The Board was authorized by the special session of the House of Delegates.

Emergency Care Plan Tested?

The medical staff of every Michigan hospital should take the leadership to be sure that the hospital emergency medical care plan has had a recent trial run.

That contention is being voiced by The MSMS Council and the MSMS Committee on Public Relations in communications to every component medical society. The need for preparedness was explained in an editorial in the July issue of *Michigan Medicine* by Brock E. Brush, M.D., MSMS PR chairman.

Chorioretinitis: Its Etiology and Therapy

Abstract: Chorioretinitis is a major cause of blindness in the United States today. The usually obscure etiology of this disorder frequently requires a multispecialty approach to the problem. This presentation discusses some of the currently prevailing concepts of the cause and treatment of chorioretinitis and suggests a program of etiologic evaluation.

BY CONRAD L. GILES, M.D.
DETROIT

Inflammatory diseases of the eye account for more than 10 per cent of all blindness in the United States. Chorioretinitis or inflammation involving either the chorid or retina is responsible for nearly half of these lesions. Since the evaluation of patients with chorioretinal inflammation frequently involves several specialists, an understanding by all physicians of the current ophthalmologic management of this entity is obviously important. This paper will discuss some of the more important aspects of the etiology and therapy of this disease.

Because the nature of the visual process precludes the usual etiologic investigation of inflammatory processes, the clinician is severely handicapped in his attempt to isolate specific pathogens. Indirect laboratory and clinical investigation must be employed since biopsy or culture of the inflammatory focus will result in the loss of the eye. Although the microscopic examination of enucleated globes has proven significant in suggesting possible etiologies and avenues for further research, this method of evaluation has little direct value in the clinical approach to a given inflamed eye. In arriving at a presumptive diagnosis the clinician must therefore depend upon blood studies, skin tests, radiologic examinations, urinalysis and stool preparations for help. With these diagnostic tools it is possible to suggest an etiology in approximately 50 per cent of all patients with chorioretinitis.

PROVEN AND COMMON ETIOLOGIC AGENTS

TOXOPLASMOSIS is the most common presumptive diagnosis recognized in posterior uveitis at the present time. Toxoplasma gondii, an intracellular parasite is involved in two separate clinical syndromes: congenital and acquired toxoplasmosis. Central and peripheral chorioretinitis is seen in both groups of affected patients (Figure 1). The diagnosis is based on a positive toxoplasmin skin test and/or confirming serologic testing (methylene — blue dye study of Sabin and Feldman or hemagglutination) with the clinical picture of an exudative chorioretinite.

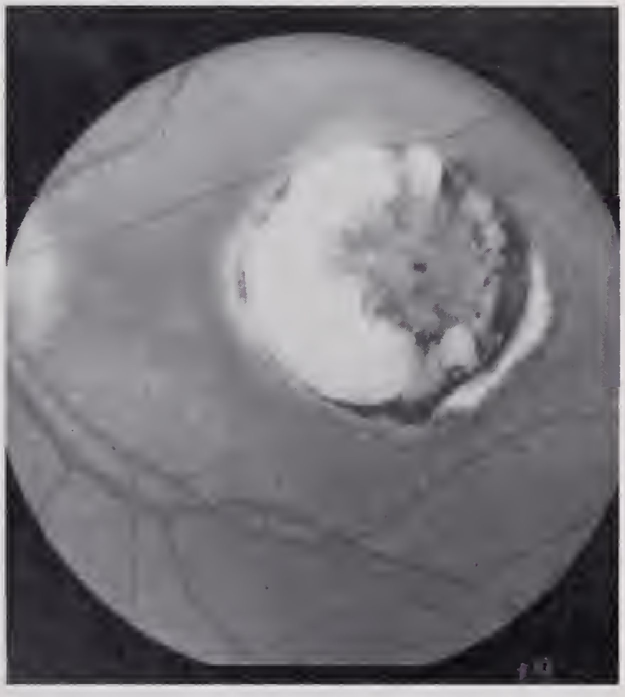

FIGURE 1: Macular chorioretinitis in 14-year-old girl with normal visual acuity and healed peripheral lesions in the contralateral eye. Sabin-Feldman titer positive 1:1024, positive toxoplasmin skin test both present.

The author is a clinical instructor in the Department of Ophthalmology, University of Michigan and Wayne State University.

SARCOID — Although involvement of the anterior segment of the eye with uveitis is more common than chorioretinitis, the characteristic fundus picture (Figure 2) in association with the systemic disease permits the clinician to diagnose another small segment of intraocular inflammation.

SYPHILLIS can involve the choroid and retina in both congenital and acquired syphillis. The disease may be either disseminated or localized and show large atrophic areas of retinal destruction. (Figure 3) The recent use of the FTA absorption study in the diagnosis of ocular syphillis suggests that a larger percentage of posterior uveal retinal disease is on a luetic basis than previously thought.

TUBERCULOSIS, unless miliary in type, is probably a very rare cause of posterior uveitis. Isolated cases have been reported and the diagnosis must rest upon the very tenuous basis of a positive tuberculin skin test in the presence of chorioretinitis.

TOXOCARA LARVAE are the most important agents involved in nematode infestation of the eye. Isolated posterior retinal lesions and vitreous abscesses, as well as iridocyclitis can be produced by this larvae. Skin testing and serologic data are unreliable and the diagnosis rests on the clinical appearance of the lesions in the pediatric age group.

UNPROVEN AND CURRENTLY FASHIONABLE ETIOLOGIES

Fashions are not limited to the haute couture of Paris and New York and choriortinitis, along with all disease of obscure etiology, has its fashions.

HISTOPLASMOSIS is currently the most widely unproven diagnosed cause of chorioretinitis. The characteristic lesion (Figure 4) is seen in a high percentage of positive histoplasmin skin reactors. This forms the basis of the diagnosis.

AUTOIMMUNE — For several decades the possibility of hypersensitivity and allergic phenomena has been suggested as an important cause of

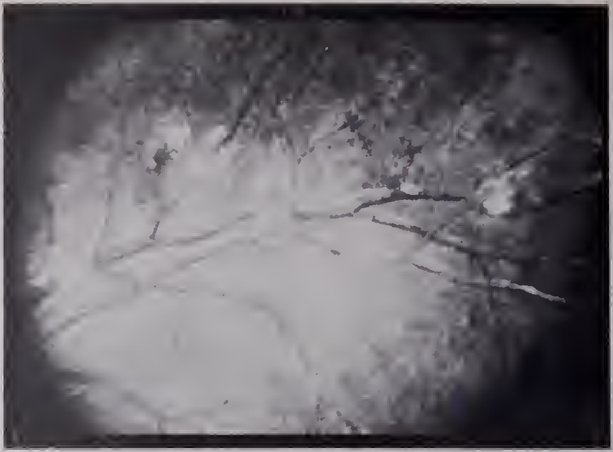

FIGURE 2: Retinal sarcoidosis with characteristic periphlebitic lesions referred to as "candle-wax droppings" in the ophthalmic literature.

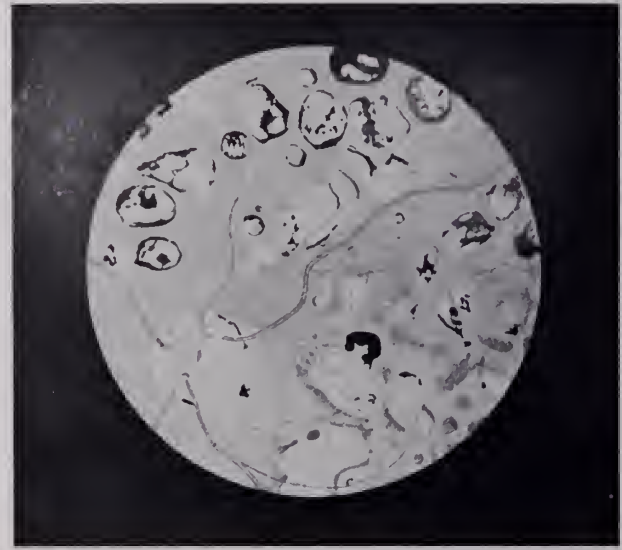

FIGURE 3: Disseminated, atrophic, healed areas of chorioretinal destruction in eye of patient with acquired syphillis.

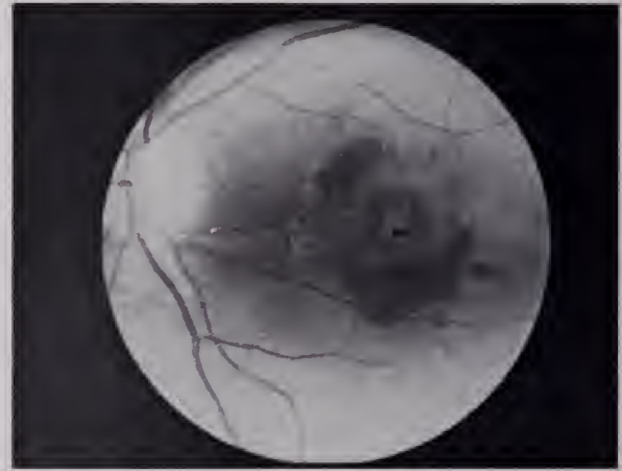

FIGURE 4: Central cystic macular elevation with surrounding collarette of hemorrhages in 35-year-old male. A positive histoplasmin skin test, negative complement fixation and chest film were present.

chorioretinitis. The significant clinical improvement following the use of antimetabolite therapy in patients with uveitis has increased the interest in this area though, once again, specific proof is lacking.

PROVEN BUT OBSCURE ETIOLOGIES

Several systemic diseases have as their components the sporadic occurrence of chorioretinitis. When the chorioretinitis occurs during the active phase of such an illness, the diagnosis, although once again presumptive is relatively simple. Unfortunately the temporal relationship between the uveal and systemic manifestations of the disease is variable. The following is a list of such diseases and is mentioned largely for completeness since lack of space and the relative obscurity of these entities in the United States does not permit a detailed discussion of each etiology.

a. Cytomegalic inclusion disease
b. Leptospirosis
c. Leprosy
d. Blastomycosis
e. Coccidiomycosis
f. Candidiasis
g. Cysticercosis
h. Onchoceraciasis
i. Brucellosis

ETIOLOGIC EVALUATION

The enormous task of ruling out all of the possible known causes of chorioretinitis in a given patient is expensive, time-consuming, unpractical and probably impossible. It is therefore necessary to formulate a pragmatic, somewhat flexible etiologic program in an attempt to isolate the etiology of chorioretinitis in as many patients as possible. The following program has been evolved to fill this need.

1. General physical examination by the generalist, pediatrician or internist to determine any associated systemic disease.
2. Skin testing — hystoplasmin, toxoplasmin, tuberculin and in endemic areas coccidioiden antigens are placed.
3. Blood studies should include a serological test for syphillis (FTA absorption), the complement fixation studies to histoplasmosis, coccidioidomycosis, blastomycosis and brucella hemagglutination and total serum protein with A/G ratio.
4. X-ray examination of the chest.
5. Stool examinations for ova and parasites in selected patients.

TREATMENT OF CHORIORETINITIS

The cornerstone of treatment of chorioretinitis is systemic corticosteroids. The use of this nonspecific anti-inflammatory agent is the only drug used in those patients in whom no etiology is found. Where specific presumptive etiologies are detected, appropriate chemotherapy is added to the corticosteroids.

Toxoplasmic chorioretinitis responds to Pyrimethamine (Daraprim-Burroughs-Wellcome) sulfadiazine and folinic acid (Leukovorin, Lederle). Large doses of penicillin and ampicillin are given to patients with luetic chorioretinitis while isonicotinic acid hydrazide (INAH) either alone or in combination with streptomycin and/or para-amino salicylic acid (PAS) should be employed in presumptive tuberculosis chorioretinitis. Thiabendazole is indicated in selected cases of toxocariasis and the indicated antimicrobial agents should be administered when any of the more obscure etiologic entities is suggested.

SUMMARY AND CONCLUSIONS

The etiology of chorioretinitis is frequently obscure. Because of the blinding potential of this inflammation, however, the ophthalmologist, together with his medical colleagues is commited to thoroughly evaluate these patients. The author has presented some current concepts concerning this entity and has suggested a program of etiologic evaluation based on currently available information. ☐

Editorial Comment:

As the author points out, Chorioretinitis still escapes etiological diagnosis in approximately 50% of the cases. The author has outlined an excellent scheme for the other 50%. Unfortunately the Generalist, Internist and Ophthalmologist will still rack their brains etiologically and therapeutically in the residue. The approach given by the author will certainly help those who have to cope with this problem. JWM.

Fetal Electrocardiography In Labor: A New Scalp Electrode

BY GEORGE E. LA CROIX, M.D.
DETROIT

Electronic monitoring of the fetal heart during labor expedites the early diagnosis of fetal distress and serves as a guide for its correction or termination by appropriate intervention. Experience suggests that intrapartum and perinatal loss may be decreased by wider application of continuous monitoring particularly in pregnancies at "risk."[1, 2] Correlation has been demonstrated between the fetal heart rate, acid-base status of scalp or cord blood, and the Apgar score.[1, 2, 3]

Sound and electrocardiography are popular approaches to clinical monitoring, but have serious limitations. Techniques utilizing multiplication of sound frequency and filtration of noise are superior to sound amplification alone,[4] but remain vulnerable to the noise of contracting uterine muscle and patient agitation. Experience with the fetal cardiac sound complexes is as yet inadequate for meaningful interpretation. Fetal electrocardiography secured through the abdominal placement of electrodes produces mixed maternal and fetal signals. Cancellation of the maternal signal is required by additional instrumentation before electronic counting can be employed. Under the best of circumstances, only the QRS wave of the FECG is identifiable, limiting its diagnostic value. In addition, the fetal signal may be entirely obliterated by the extraneous noise of the contracting abdominal and uterine muscle of the parturient in active labor.

Electrocardiographic techniques in which one or more electrodes make contact with the fetus produce a strong fetal signal. Resulting FECGs have minimal or absent maternal signal contamination and are therefore immediately suitable for electronic rate meters. Occasionally, detail is of sufficient clarity to permit analysis of the fetal electrocardiogram.[5] In labor, the presenting part of the fetus provides a point to which electrodes may be secured. Membranes must be ruptured, limiting such monitoring to the active phase of labor. Several types of electrodes consisting of prong-like, suction cup or modified skin clip varieties have been described for this purpose, but possess individual weaknesses which have limited their clinical usefulness.[5-9] Some are bulky or rigid, difficult to apply, require special aptitude, applicators or endoscopes for insertion, connectors and additional ground wires to the maternal thigh or ankle.[5-9]

A NEW ELECTRODE is described which eliminates many of the undesirable features of other types. Trial in over 150 patients has confirmed its safety, reliability, simplicity, ease of application, and clinical usefulness.

THE ELECTRODE

Figures 1, 2 illustrate the electrode. The negative electrode is a fine silver plated angle hook, similar in calibre to a 25-gage needle. The positive pole located one centimeter distal to it consists of a pure silver wire wound twice around the polyolefin jacket. Two fine wires within a continous tinned copper shield conduct the fetal cardiac potential from the two electrodes. The electrical circuit is completed through the vaginal secretions and amniotic fluid. The external shielding serves as an effective ground by continuous contact with the vaginal mucosa.

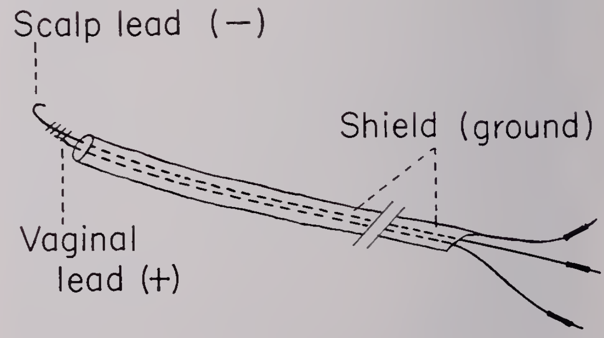

FIGURE 1: The negative and positive wires conduct the fetal cardiac potential from their respective pole. The wires are insulated from the outer sheath, which by maintaining contact with the vaginal mucosa, serves as the ground.

The author is associated with the Department of Gynecology and Obstetrics of the Wayne State University School of Medicine.

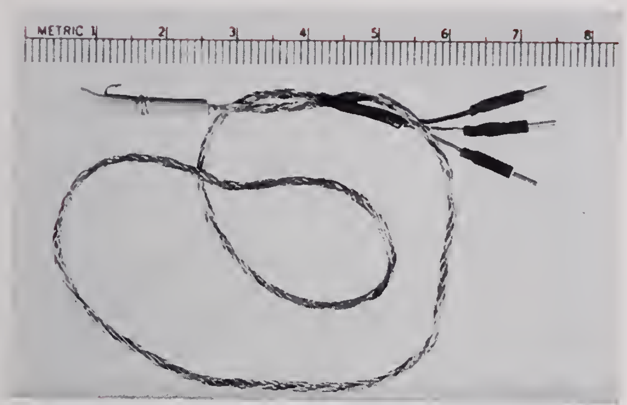

FIGURE 2: The leads are composed of fine flexible wires of 12-inch length. The overshoot of the polyolefin jacket helps to prevent motion of the electrode. The 3 micro connectors facilitate rapid connection to a lightweight patient cable.

CONSTRUCTION MATERIALS

All materials utilized in the construction of the electrode are available through local electronic and jewelry stores. The angle hooks are silver plated by a local electroplating concern.

1. #32, 2 conductor shielded Belden wire, #8429.
2. Silver wire, pure 26 gage.
3. Micro connectors, Amphenol, Reliatac-PO2.
4. Polyolefin tubing — Alpha F.I.T. — 300 — 1/8″ brown.
5. Shrink tubing — Alpha F.I.T. — 105 — 1/16″ white.
6. Angle hooks — Mustad-Viking — No. 94840 — #16 (extra fine).
7. Epoxy glue (Elmers).
8. Clear epoxy varnish.

METHOD OF CONSTRUCTION

The external shielding is stripped back one inch at either end of a 14-inch segment of wire, the excess shielding wound tightly at the distal end, and clipped off at the electrode end. Micro connectors are soldered to the shielding and the two exposed wires. A ½-inch segment of 1/16-inch white Alpha tubing is then heat shrunk over each solder junction for added durability. Attention is then directed to the construction of the electrode. The eye of the angle hook is removed, and the hook soldered to the black wire (negative pole). A 1½-inch segment of 26-gage silver wire is soldered to the red wire (positive pole). Both junctions are coated with epoxy glue. A one-inch segment of polyolefin tubing is perforated with a large needle at the ¾ and ½-inch mark, placing the holes at right angle to each other. The angle hook is inserted into the tubing and then through the ¾-inch opening. The silver wire is introduced through the opening at the ½-inch mark. The tubing is then heat shrunk forming the polyolefin jacket. The silver wire is wound twice tightly around the jacket one centimeter distal to the angle hook. The entire electrode — excluding the tip of the hook — is coated with clear epoxy varnish, air-dried and oven-baked at 200°F for one hour. The silver wire is lightly filed over a small area to expose the silver.

TEST PROCEDURES

Electrodes are tested prior to use for polarization noise and uniformity as outlined by Hon.[5] The response of the electrode when immersed in .9% saline in a shielded enclosure and tested by a suitably sensitive preamplifier generally reflects the noise level encountered in the in vivo studies. Electrodes are tested only at rest since the external shielding produces artifacts with agitation not seen in clinical use. An electrode with baseline drift or transient spikes of less than 25 microvolts is suitable for fetal electrocardiography. Excessive noise may be eliminated or decreased to an acceptable level by lightly electrochloriding the electrodes in .9% NaCL solution. Figure 3 illustrates the effect of electrochloriding. Any electrode with shorting between wires, lack of electrical continuity or excessive noise is discarded. Figure 4 illustrates the clarity of the FECG.

The amplitude of the FECG in 50 patients is illustrated in Figure 5. The QRS wave has ranged from 75 uv. to 800 uv. with the average 250 uv.

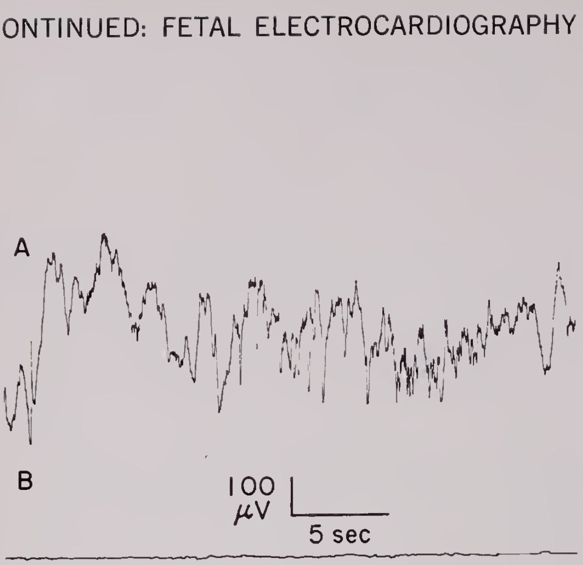

FIGURE 3A: Basic polarization noise of the Ag-AgC1 electrode tested in .9% saline. The drift and spikes seen in the test environment may be reflected in the FECG. Paper speed 5 mm. per second. Recorded on a Sanborn Recorder - Model 2100.

FIGURE 3B: Note the improvement in the noise level when the positive and negative electrodes are electrochlorided for one minute at 1½ volts. Paper speed 5 mm. per second. 100 uv. calibration is the same in A and B.

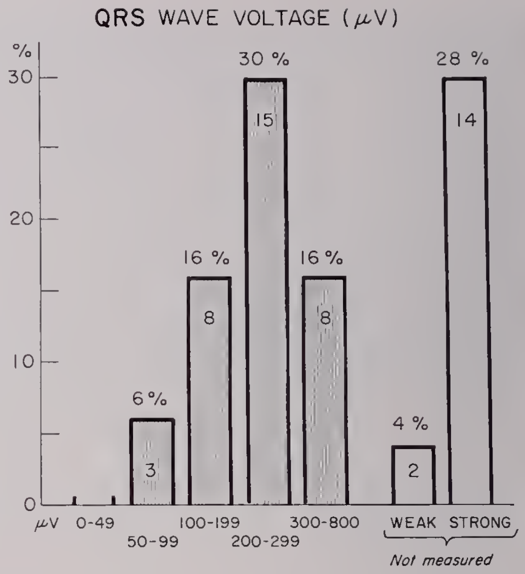

FIGURE 5: The distribution of fetal electrocardiograms in 50 patients according to the amplitude of the QRS wave. The weak signals (under 200 uv.) and strong signals (over 200 uv.) were calibrated by visual estimation of the oscilloscope image. The remainder were accurately calibrated from permanent records.

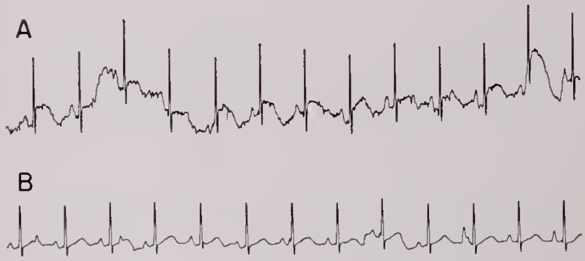

FIGURE 4A: If the electrodes are not electrochlorided, a "noisy" FECG may result. The QRS wave measures 250 uv. Paper speed 25 mm. per second. This FECG is suitable for cardiotachometry, but of less value for analysis of FECG components.

FIGURE 4B: A "quiet" FECG followed electrochloriding the positive and negative electrodes. The QRS wave measures 400 uv. Paper speed 25 mm. per second.

CLINICAL USE

The electrode has been inserted at virtually any stage, station (minus 3 to plus 3) or dilation in labor which permits passage of the uterine packing forcep. Application usually requires less than one minute. The fetal membranes must have been ruptured prior to application or amniotomy is performed as soon as obstetrical conditions become favorable. The distal polyolefin jacket is grasped by the clamp, introduced under aseptic precautions in bed using two fingers of the opposite hand as a guide (Fig. 6). The angle hook is placed in apposition to, and gently set into the scalp, taking care to avoid suture lines or fontanelles. The small diameter of the hook prevents penetration deeper than 2 to 3 millimeters. Usually applied to the fetal vertex, it has produced clean tracings in five infants presenting by the breech. No injury has occurred to mother or infant in over 150 applications.

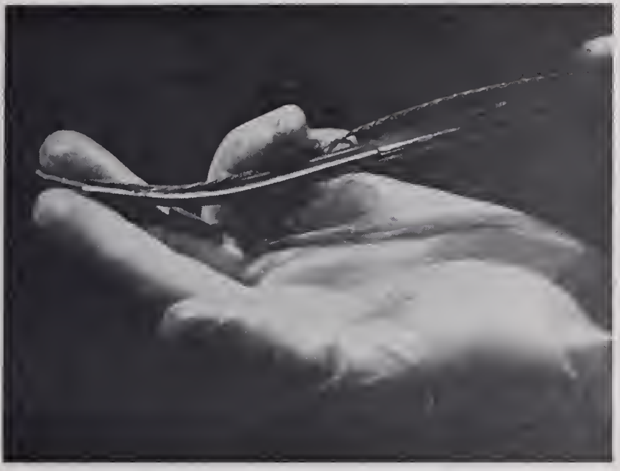

FIGURE 6: The distal end of the polyolefin jacket is grasped by the uterine packing forceps, introduced vaginally under aseptic precautions, using the fingers as a guide.

Although the best results with an electrode are obtained on the first occasion, many have been used four to five times. Special care is not necessary when cardiotachometry alone is contemplated, but thorough cleansing, retesting and chloriding are desirable for optimal detail of the FECG. Conventional autoclaving will not injure the electrode.

COMMENT

Investigation of the fetal electrocardiogram and its application for electronic heart rate counting have clinical and research value. The small size of the angle hook electrode makes possible its use from early in the first stage of labor through the hazards of the first and second stages when the infant is at major risk. The fetal cardiac complex may be permanently recorded for analysis, displayed on an oscilloscope, or used to trigger a cardiotachometer or suitable audio visual system.

Editorial Note:

Fetal monitoring during labor will do a great deal to lower fetal mortality, especially in such cases as prolonged and difficult labor as well as prolapsed cord. People in various centers are working on fetal oximeters but as yet I do not know of any practical set up. The author presents a simple and apparently excellent method for fetal ECG monitoring. It is to be hoped that many hospitals will adopt this procedure. JWM

COMING EVENTS

For more news about Coming Events read the four blue pages in the middle of this issue and every issue of *Michigan Medicine;* and watch for the *News Extra* during the middle of each month.

COMMUNITY HEALTH WEEK PLANNED FOR OCTOBER

MSMS plans for Community Health Week, October 20-26, are rapidly developing. MSMS is planning a program for a statewide meeting to focus on the major problems in medical service to rural areas of Michigan, the AMA rural emergency care plan, the problems of health manpower, and other related topics. The meeting is an example of how Community Health Week, Oct. 20-26, can be adopted to focus on local needs.

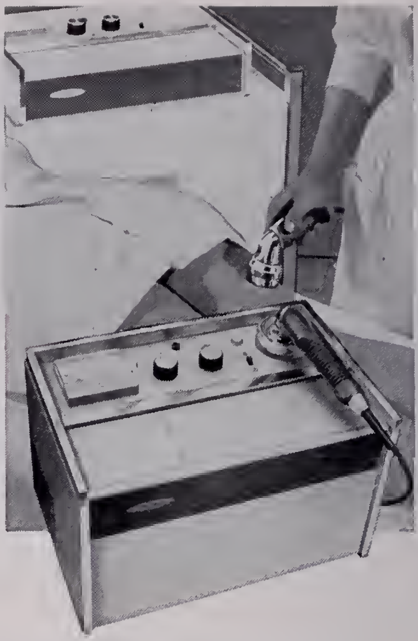
Health Careers is one of three topics suggested by the American Medical Association, the others are drug abuse and physical fitness.

A promotion kit is available to help county societies prepare for Community Health Week. Copies can be obtained from MSMS headquarters.

The Michigan Health Council and the Michigan Association of the Professions are cooperating.

MICHIGAN MEDISCENE

Aug. 21 — The Council, MSMS Headquarters, East Lansing (Tentative)
Sept. 22-23-24 — MSMS House of Delegates, Sheraton-Cadillac Hotel, Detroit
Sept. 24-26 — Woman's Auxiliary to the MSMS, Annual Convention, Statler-Hilton Hotel, Detroit
Sept. 24-26 — MSMAS Annual Session, Pontchartrain Hotel, Detroit
Sept. 25-26 — MSMS Annual Scientific Session, Sheraton-Cadillac Hotel, Detroit
Oct. 11-12-13 — University of Michigan Medical Center Alumni Conference, Ann Arbor
Nov. 10 — MSMAS Officers' Workshop, Port Huron Motor Inn, Port Huron
Nov. 11-15 — American Public Health Association Annual Conference, Cobo Hall, Detroit



Another step forward in Ultrasonics The Burdick UT/420 Continuous or Pulsed Ultrasound

Burdick introduces its newly designed UT/420 Ultrasound! Handsomely styled, the new UT/420 produces a combination of thermal, mechanical, and chemical effects in tissue not possible with any other modality. Selection of **continuous** or **pulsed** energy offers flexibility of treatment—pulsed ultrasound permits increased mechanical effects at higher intensities without pain.
Ask your Burdick dealer about the UT/420 (he has an **Ultrasound Dosage Chart** for you as an aid to more effective treatment)—or write us.

These Firms Make '68 Annual Session Possible without a Registration Fee

One of the colorful and educational aspects of the MSMS Annual Session in Detroit this September will be the interesting array of exhibits.

MSMS leaders say, "Take time to inspect each one — not just a casual look — but a real indepth study. You will be surprised at the wealth of new information they will offer you."

Following is a list of the firms who will be presenting displays at the 1968 MSMS Annual Session. Doctors are urged to make a special effort to visit each booth to personally express appreciation and to ask questions.

Income from the leasing of exhibit space makes it possible for MSMS to present its excellent Annual Scientific Session without a registration fee.

The intermission periods between scientific sessions will provide excellent opportunities to study the exhibition. The registration desk, meeting rooms, and exhibits will be conveniently located on the same floor as the meetings.

MSMS also wishes to express its gratitude to those who have generously made program grants to the Annual Session. These contributors are:

The Upjohn Company

Warner-Chilcott Laboratories

Abbott Laboratories
American Health Credit Plan of Michigan, Inc.
Alta Supply Company
Ames Company
Astra Pharmaceutical Products
Audio-Digest Foundation
Ayerst Laboratories
Barrington Research Associates
Black & Skaggs Associates, Professional Management

Of Partnerships and Politics

BY D. BONTA HISCOE, M.D.
LANSING

A good and rather outspoken friend of mine recently cut off a conversation on the general subject of medicine's future by saying, "I'm sick to death of hearing about what they'll do if we don't."

This physician happens to be more well-informed than the average. He knows that medicine is now considered a right and not a privilege. He is aware of the recent great progress in medicine and the revolution of rising expectations. He is aware of the recent avalanche of medical legislation — Medicare, Heart Disease, Cancer and Stroke, and Comprehensive Planning.

Inside he knows that his remark only ends the conversation — it doesn't solve the problem.

The best answer I know to his attitude was presented by Dr. Wallace S. Sayer, Chairman of the Department of Public Law and Government at Columbia University, at a recent meeting sponsored by the AMA. Speaking about the American political system as an environment in which we must work, he stated: "What I would like to do is to welcome you to a world you've been shy about entering, but in which you have now arrived, and to reassure you that the rules of survival can be learned and that the mortality rate is low." He pointed out that the decision-making system of our country is pluralistic, that there is room for all, and that there are many centers of power competing with each other. He said, "When it comes to important public policy, politics are inescapable. Decisions are reached in this system . . . . . by bargaining among competing centers of power. 'Bargaining', if not quite a respectable word to this audience, is an indispensable skill in the system. One way to unlock the mysteries of what happened to the A.M.A. in the last ten years, might be to say that an indisposition to bargain means defeat. A successful participant in this system must be prepared to bargain." He then explained that all decisions are tentative, never final, and that an essential part of bargaining in this system is alliance-building.[1]

In other words, if you're in the water, whether you're fish, fowl or mammal, you must swim.

The background for my remarks has already been well laid by James T. Howell, M.D., at last year's MHA Medical Staff, Trustees and Administration Forum at Mackinac Island in June of 1967. He said then that both doctors and hospitals are dedicated to the eradication of human ills, and to maintaining freedom from direct controls. If either one falls under central control, so does the other. And yet, doctors and hospitals are not united in their efforts.[2] May I suggest some practical first steps to accomplish this end?

WHAT'S HAPPENING

Our medical care system has recently been picked apart, studied, analyzed, and evaluated by a new breed called "problem-solvers", whose unsolicited attention is both flattering and disconcerting.

In the past few years extensive studies have been carried out by many individuals and agencies who have worked under a variety of auspices. Their principal questions were: "How is the job being done?"; "Is the whole need being met?"; "Can it be done better, now, and in the future?"

Some of their reports will have considerable bearing on the future of medicine. A few of the most significant reports are:

The Folsom Report — entitled, "Health Is A Community Affair."[3]

The Coggeshall Report, focusing on medical education and the future.[4]

The author, president of the Health Planning Council of Michigan, presented these remarks at the 1968 Medical Staff — Trustee — Administrator Forum at Boyne Mountain Lodge.

The Millis Report, which introduced the term, "primary physician."[5]

The report of the National Advisory Commission on Health Manpower, released in 1967.[6]

The immediate reaction of those being poked and probed is similar to that of a patient having a barium enema. He would like to disparage, discredit and dismiss the whole thing as unnecessary tampering or meddling. This is, of course, unbelievably short-sighted.

CERTAIN POINTS MUST BE CONCEDED

First, there are problems that have stimulated these studies. We may not agree as to how many there are or as to their significance, but there are problems.

Second, there are enormous pressures to search for answers. Manpower and facilities are in short supply and the demand is great, creating, in effect, a demand-pull type of medical inflation. In order to cope with the current and inevitable increase in cost, the organized consumers (the government, labor, business and the insurance companies) are expressing firm demands for efficiency and cost control. Some things new, different and better, are expected.

Third, legislation has been passed, which shows that they mean business. More will come.

Fourth, we must concede that these people (doing the studies) are highly intelligent, thoughtful, and imaginative. They represent disciplines and approaches foreign to the medical community. They may on occasion be misguided or unenlightened, but they are smart.

CONCLUSIONS OF THE CRITICS

FIRST, they say our medical care system today is actually a "non-system."[7] A recent *New England Journal of Medicine* editorial succinctly puts it this way: In medical care "vast and fruitful attention has been paid to research and development, but marketing, sales and packaging have been sadly neglected."[8] There should be a system.

SECOND, they say that the community interest should take precedence over any special interest group, be it hospital, physician, research institution or medical school.

THIRD, the scope of medical care should be increased to include total health care, rather than remain chiefly crisis-oriented.

FOURTH, the primary center for medical care on the local level should be the hospital rather than the physician's office.

FIFTH, though the types and roles of physicians in the future have not been well-defined, physicians are being firmly encouraged to develop various types of coordinated or group practice, and to utilize ancillary help.

So much for the views of our critics. Let me now respond with my own personal views as to how we, doctors and hospitals together, should respond to these challenges.

UNITING THE EFFORTS

Physicians are essential in medical care, but they cannot practice today's medicine in a vacuum. They need hospitals in order to ply their trade satisfactorily. On the other hand, hospitals are not independent health care units either — they need doctors. I know of very few hospital administrators who could practice good medicine, and there are many bankers and salesmen who will attest that physicians are wretched businessmen.

In past years physicians and hospital administrations have developed a guarded relationship by carefully defining their respective areas of responsibility. So long as each did his job well, the hospital thrived, and its position in the community was assured. But in the future, if current thinking prevails, the autonomy of each hospital is threatened with integration into a community-wide system, while at the same time, the sharp distinctions between hospital administration and medical practice are becoming blurred. As new regulations come from all directions, hospital administration is being given more responsibility for the quality and quantity of medical care. For example, hospitals are now legally liable for the medicine practiced within their walls. And while the hospitals are thus pushed into medical concerns, the Commission on Health Manpower has recommended "an increase in the physician's responsibility for the successful and economical management of the hospital operations" — that he have a financial stake in the management of the hospital, and be included on the boards of control!

It is clear, then, that physicians and administrators are actually both essential parts of a single organism. And it is time for them to function this way.

It is time for us to give up prejudices and animosities inherited from the past. These are luxuries we cannot afford. It is time to learn the rules of the new ball game. It is time to show some real initiative. It is time for medical societies and hospital associations at all levels to realize that by working together they can accomplish much more, both for their communities and for themselves.

Physicians' services account for about 25% of the health care dollar. Hospital expenditures account for 33%. If we include the drugs we dispense, about two-thirds of the medical care dollar passes through our hands. Together, we represent the system (or "non-system") as it is today, and we are responsible, in large part, for both its successes and its failures.

PARTNERSHIPS of all kinds are the "in" thing today. Congress recently named a bill, "Partnership in Health." College kids work like crazy at it. Why shouldn't we?

This combination would put together the "Doers" of medicine. If we could work out constructive and responsible common stands on major issues, we could have tremendous influence. Then within the medical system, we, the "Doers," could more effectively stand up to the planners, researchers and educators. In the political arena our voice would command more attention than the efforts of our separate trade associations. We could form a powerful nucleus for practical, reasonable and evolutionary change.

In actual fact, no one group, nor single partnership, will call the majority of the shots, much as we might like to. That's why even a partnership such as I propose should promptly build cooperative arrangements with the many other voluntary groups interested in the future of health care.

We are told that the ideal and ultimate solution should be a partnership between the whole voluntary sector and the government. If this be the case, I strongly urge that our half of the partnership be pulled together firmly and strongly, be solidly built and well stacked.

SUGGESTIONS

I feel that it is urgent to push this type of working coalition into being soon. I'm therefore going to take a few minutes to make a few firm and concrete suggestions.

On the national and state levels, dormant and atrophic liaison mechanisms should be shined up and reactivated. If they have vanished, active new liaison committees should be established — not to be polite and exchange platitudes — but to explore all areas and means of cooperative action. Speak to the delegates of your respective associations and give them a push.

In the meantime, County Medical Societies should incorporate the know-how of Hospital Administrators into their deliberations. Administrators should be an integral part of all hospital relations committees. Administrators should also be included as part-time members or consultants on other appropriate committees. The hospital regional associations should do the same thing on their part.

SPECIFICALLY, HERE are some things I think we can work on:

FIRST, continue to produce useful conferences such as this Staff, Trustees and Administrators Conference, developing understanding and new ideas.

SECOND, coordinate some public education programs, particularly those promoting health careers, discussions about current health matters, and public health.

THIRD, by combined effort, more effectively support (or challenge) new legislation.

FOURTH, cooperatively contest questionable court action in order to modify an influence with an ever-increasing impact on medical practice.

FIFTH, participate in planning efforts together, so that we can propose voluntary solutions to health care problems. The Health Manpower Commission Report acknowledges that the Federal Government alone is not big enough nor rich enough to solve the problems of health care for the whole country. They are anxious to share this responsibility, but the question has been, "with whom?"

When one looks at the strong competition — State Government and Regional Medical Programs — one quickly realizes that within the voluntary sector petty rivalries are stupid, irrational and self-defeating. The voluntary sector must rise to the challenge. The opportunity may be brief!

Representatives of the voluntary sector must demonstrate the foresight to support significant efforts; we must have the maturity to evaluate new ideas dispassionately; and we must demonstrate the stature and courage to carry out worthwhile ideas. Voluntary agencies are best able to maintain flexibility in the face of multiple problems. The mere presence of a strong united voluntary sector with its great intellectual and political resources would be certain to win a much more significant role in future planning.

The Health Planning Council of Michigan, appropriately supported and developed, could be a strong spokesman for our partnership, since it is supported not only by physicians and the hospital associations, but also includes other health-oriented groups and interested laymen. This organization's sole function is to promote local and regional planning, and in no way does it presume to dictate to nor supplant the local planners.

SIXTH is the area of common concern — money. Ironically, in the future we will have to protect medicine's share of the federal pot of gold. Currently, federal money is abundant. Hospital and physician income will be increasingly subsidized by government. Should social interest shift and other pressures threaten curtailment of this support, the protection of this subsidy on which future budgets, personal and hospital, will depend, will become an increasingly important project for everyone interested in health care.

CONCLUSION

The dictionary defines intelligence as "the ability to respond successfully to new situations." This offers a great challenge to our collective conceit.

Let's see to it that the integrated medicine of the future truly fills the patient's needs, and maintains flexibility in the process.

Let's accept the challenge. Think big. Work hard. Together.

And above all, let's see to it that we are at least co-captains of the comprehensive ship.

The Need for Utilization Review

BY LOUIS F. HAYES, M.D.
VICE PRESIDENT, MEDICAL AFFAIRS
MICHIGAN BLUE SHIELD

A previous article published in *Michigan Medicine* dealt with the "what?" of utilization review. A quite simple definition was reached — measurement of the use of medical service. Equally as important, the objective was also defined — the best medical care for the most people at the lowest cost.

To attain a thorough understanding of utilization review (the ultimate objective of the planned series of articles) the next question to be answered is "Why?" What is the need for utilization review? What are the factors that compel us to this extracurricular task? Why the urgency?

FIRST, LET US IDENTIFY THE factors involved and then evaluate their influence. And, once again, let us simplify it as much as possible. The influencing factors are the product — medical services; the consumer — the patient; the provider — the physician and his allies; the third party — government, industry, labor, health insurance carriers; the environment — where the service is rendered; and the economics — the cost of the service. Each is highly contributory; taken all together they develop a strong case for the necessity of utilization review.

Medical service, the product, is not a static commodity. Over the years such services have increased in quantity and quality with a resultant increase in unit and total cost. The challenge is how to make these services available to all at reasonable cost. How can this be done if we have no means of measuring normal use?

More and more the consumer assumes an important role. Formerly docile and easily led, he is now educated and sophisticated, particularly in medical matters. He realizes the benefits of quality medical care and its contribution to his well-being and longevity. He is aware now of the advances in medicine and earnestly desires the best in care for himself and his family. He is willing to pay a good share of his income to fill his needs, but if he can't afford it, he wants help to do so.

HOW CAN HE BE assured of quality?

How can he be assured of reasonable cost?

Only if we have the capacity to measure can we assure him. Only if we have the capacity to measure can we identify his needs and solve the problems of distribution of services, making this quality care available to him.

The physician and his team face a dilemma. In the face of an increasing population and increasing doctor to patient ratio, how is he to deliver the service? How is he to make available the better quality, the greater quantity of care to his patients? His predicament cannot be solved unless he has a way to measure the quality, to evaluate the cost versus the need. Utilization review would provide some of the information needed for such decisions.

The ultimate interests of all third parties are the same — getting the most and best care at the lowest possible cost per person. Their spheres of influence vary, occasionally overlap, but the objective is the same. And their interest cannot be maligned — their dedication to the task and desire for fulfillment equals that of the patient and the doctor.

Government seeks to assist by subsidization, but in protecting tax must have concern for quality and availability. Health insurance carriers aid by administering the techniques of prepayment and risk sharing, but have the same fiscal responsibilities and the same concerns toward members as government has for taxpayers. Industry and labor are equally concerned and pragmatic. Industry pays out large sums, negotiated by labor, to purchase medical care. As practical businessmen, managers want the best product at the best price. But how can this be determined unless we measure?

Doctor Hayes, formerly of Gaylord, is now vice president, medical affairs of Michigan Blue Shield in Detroit. This is one of a series of articles.

ENVIRONMENTAL FACTORS are significant in their impact. The location of the patient may influence the quantity and quality of medical service available; strangely enough there is deprivation in both congested urban areas and remote rural areas. Here is a need for measurement. Yet another need is the measurement of the efficiency of the site of the service — the hospital, the office, the home.

The final factor to consider is that of economics. All medical service has some cost; additionally, even the most naive will recognize that the total cost of medical service is rising and honesty compels us to recognize that the unit cost of care is also rising. Perhaps this trend cannot be stopped, but surely it can be reasonably controlled. *We* of health care to discover what is "reasonable." As a result we could maximize the efficiency of the delivery of medical services in all environments, thereby keeping cost to a minimum.

IS THERE ANY DOUBT of the need?

Everyone (the provider, the patient, the public) has the same concern, the same objective; each has his own interest, his own concerns; all have something to contribute in attaining the goal. Economic facts and the needs of all dictate the need for cost control; social and geographic facts dictate the need for quantity control. And, though there are other factors, the best interests of the patients, the pursuit of excellence and the professional pride on the part of the physician dictates quality control. He has proven his ability in the past, he can in this instance.

Measurement — utilization review — is the tool that can aid. ☐

MONTHLY SURVEILLANCE REPORT CASES OF CERTAIN DISEASES REPORTED TO THE MICHIGAN DEPARTMENT OF PUBLIC HEALTH FOR THE FOUR-WEEK PERIOD ENDING JUNE 29, 1968

	1968 This 4-Week Period	1967 Same 4-Week Period	1968 Total To Above Date	1967 Total Same Date
Measles	31	74	233	864
Whooping Cough	36	57	247	537

Information can be supplied by the local health department on the local incidence of disease.

R. Gerald Rice, M.D., Director
Michigan Department of Public Health

ACTIVITIES, PROJECTS

PSYCHIATRY SOCIETY TO REPEAT COURSES

Beginning in September, the Michigan Society of Psychiatry and Neurology in conjunction with the Michigan Academy of General Practice again will offer its course in psychiatry for non-psychiatric physicians in several major cities around the state.

The nine-month course will end in May, 1969. It will be held on a given day of each month from 1:00 P.M. to 5:00 P.M.

This year the program will be open not only to physicians but also to psychologists, social workers, clergymen, nurses and other interested professionals. The program will emphasize principles and practice of psychological counselling and the management of emotional problems such as adolescents, marriage conflicts, hospitalized patients, psychosomatic and somopsychic disorders, neuroses, character disorders such as alcoholism, and some psychoses.

Physicians may obtain details from Leonard Rosenzweig, M.D., 515 Lakeside Drive, S.E., Grand Rapids, 49506. ☐

BOOK FIRM FOUNDATION HONORS EASTERN PROF

John Eager Howard, M.D., professor of medicine, Johns Hopkins University School of Medicine, received the Passano Foundation Award during the annual AMA meeting in San Francisco.

The Passano Foundation was established in 1945 to honor outstanding men of medical science in the United States. The Award of $5,000 is made yearly during the AMA convention. The Foundation is sustained by annual contributions from The Williams & Wilkins Company, a leading publisher of medical books and journals. ☐

MDPH Seeks Infants With Hearing Problems

Michigan physicians are being asked by the Michigan Department of Public Health to help identify and locate infants with profound hearing loss due to maternal rubella in early pregnancy.

According to a recent statistical projection made by the Department, 4,000 Michigan babies may have profound hearing loss resulting from the rubella epidemic which swept the country in the mid 60s, reaching a peak in Michigan during the years 1964-1966.

Theresa B. Haddy, M.D., Chief of the Division of Child Health at the Bureau of Maternal and Child Health, says that, "In the last year and a half over 400 infants with profound hearing loss have been identified. These range in age from 3 months to 3 years. A large proportion have positive histories of possible maternal rubella. This greatly increased incidence of profound hearing loss in early infancy suggests that Michigan babies were affected by the rubella epidemic."

"Early identification of hearing loss in infants is extremely important," she continues. "Carefully selected hearing aids and programs to stimulate the development of language and speech should be considered as early as possible."

"Local health departments," Doctor Haddy concludes, "or the Hearing and Speech Section of the Michigan Department of Public Health can assist with information regarding centers equipped and staffed to test the hearing of babies." ☐

STATE BIRTHS, DEATHS SHOW STEADY INCREASE

Both the number of births and deaths have increased in Michigan for 1967, as compared to 1966, according to provisional figures released by the Michigan Center for Health Statistics.

Comparing the two years, the causes of death have remained relatively the same — the big three of course being heart disease, cancer, and stroke, in that order.

There was a slight dip in the number of deaths due to accidents in 1967 as compared to 1966. ☐

	1966	1967
Births:	155,794	162,756
Deaths:	74,596	75,245
Causes of Death:		
1) Heart Disease	28,277	28,642
2) Cancer	12,506	12,999
3) Stroke	7,732	7,834
4) Accidents	4,737	4,470

In peptic ulcer:

the antacid puzzle

solved by

Mylanta®

aluminum and magnesium hydroxides *plus* simethicone

"will it ease the pain?"

Mylanta helps relieve ulcer pain with the two most widely prescribed antacids: aluminum and magnesium hydroxides.

will it help "my gassy stomach"?

Mylanta *also* contains simethicone: for concomitant relief of G.I. gas distress.

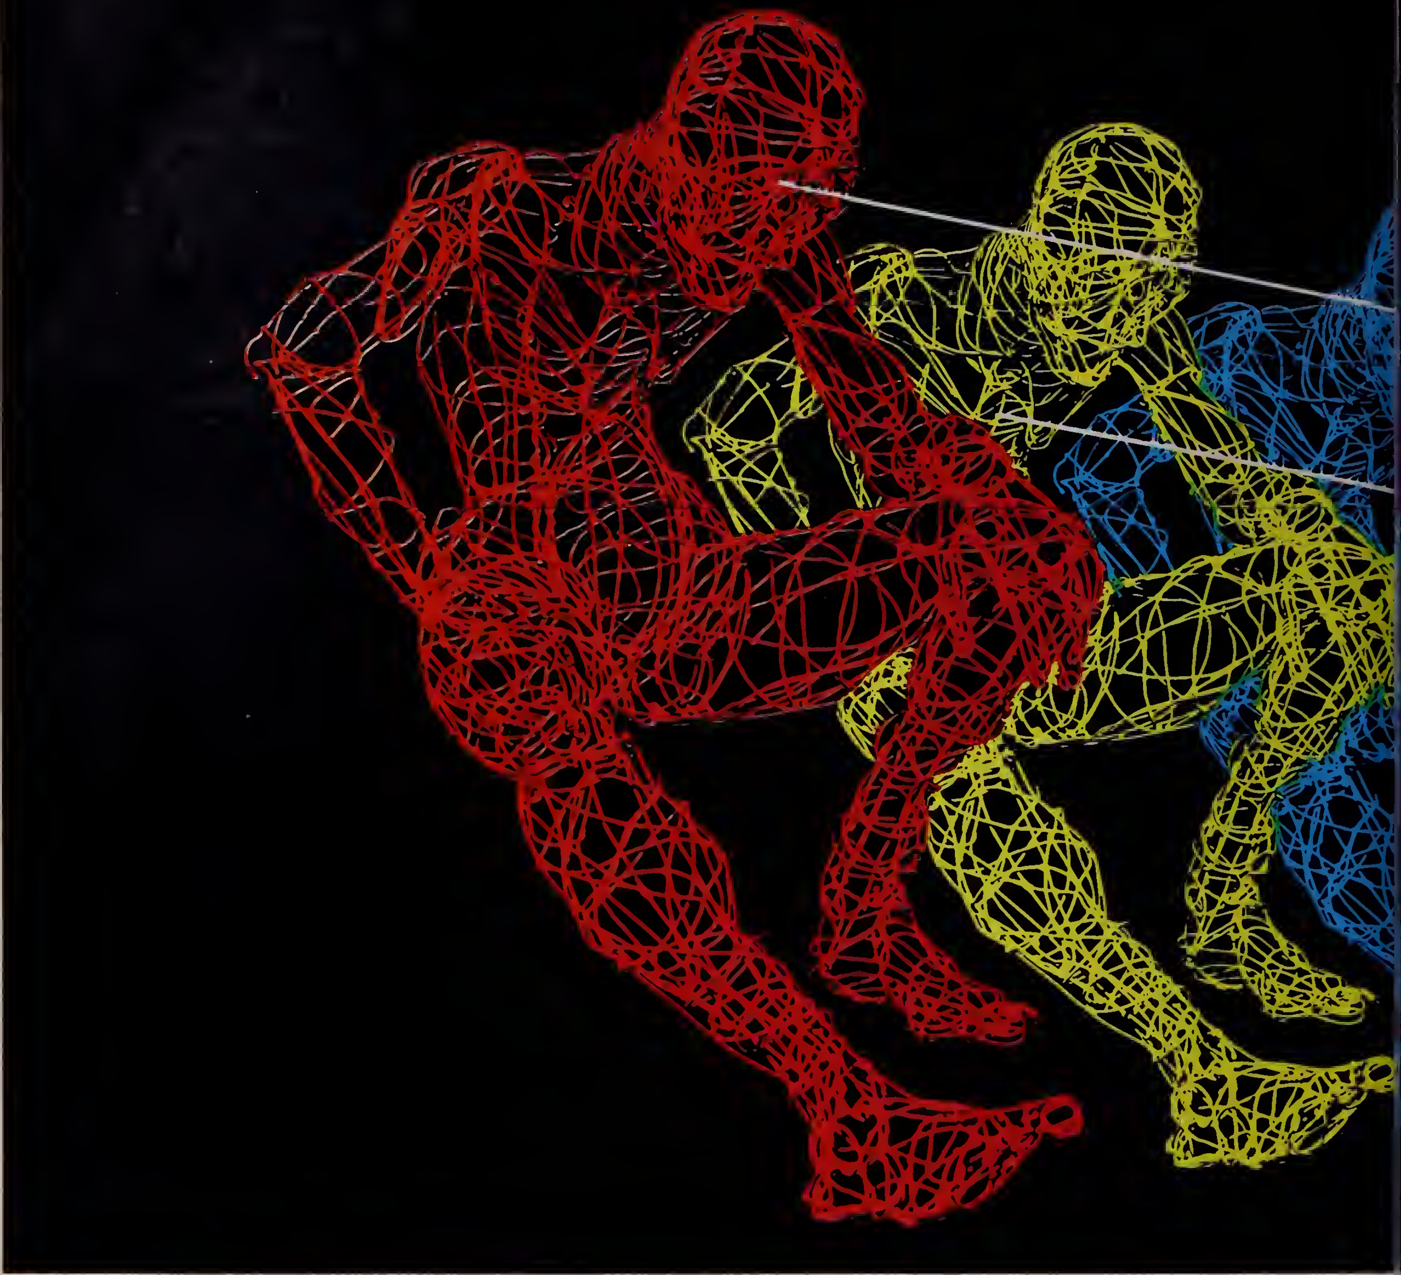
"will this one taste O. K.?"

The *prolonged* acceptance of Mylanta was recently confirmed in 87.5% of 104 patients—after a total of 20,459 documented days of therapy.* *Danhof, I. E.: Report on file.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. *Dosage:* One or two tablets (well chewed or allowed to dissolve in the mouth) or one or two teaspoonfuls to be taken between meals and at bedtime.

Stuart Division/Pasadena, Calif.
ATLAS CHEMICAL INDUSTRIES, INC.

a comprehensive hematinic



Description: Each Pulvule® contains—

Special Liver-Stomach Concentrate, Lilly (containing Intrinsic Factor)	150	mg.
Cobalamin Concentrate, N.F., equivalent to Cobalamin	7.5	mcg.
(The total vitamin B_{12} activity in the Special Liver-Stomach Concentrate, Lilly, and the Cobalamin Concentrate, N.F., is 15 micrograms.)		
Iron, Elemental (as Ferrous Fumarate)	110	mg.
Ascorbic Acid (Vitamin C)	75	mg.
Folic Acid	1	mg.

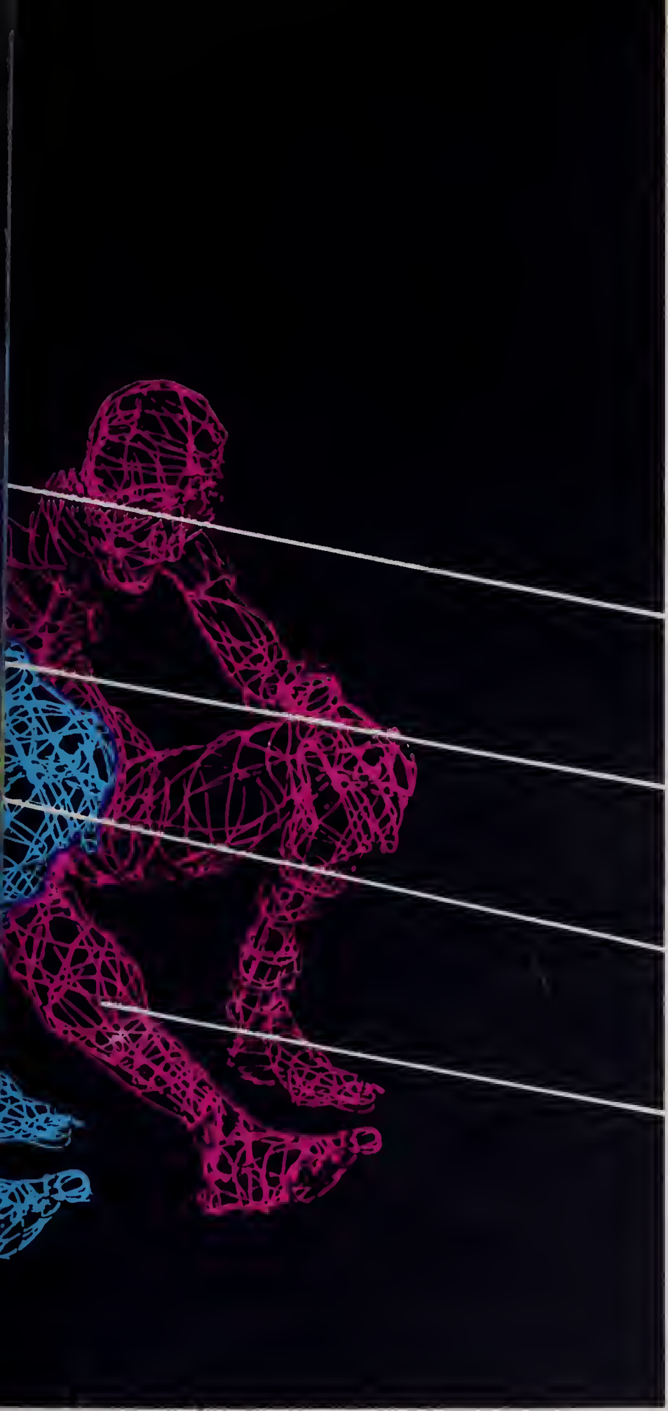
Indications: Trinsicon® (hematinic concentrate with intrinsic factor, Lilly) is a multifactor preparation effective in the treatment of anemias that respond to oral hematinics, including pernicious anemia and other megaloblastic anemias and also iron-deficiency anemia.

Contraindications: Hemochromatosis and hemosiderosis.

Precautions: Anemia is a manifestation that requires appropria investigation to determine its cause or causes.

In pernicious anemia, the use of folic acid without adequa vitamin B_{12} therapy may result in hematologic remission but ne rological progression. Adequate doses of vitamin B_{12} (parenter or oral with potent intrinsic factor as in Trinsicon® [hemati concentrate with intrinsic factor, Lilly]) usually prevent, halt, improve the neurological changes.

As with all preparations containing intrinsic factor, resistan may develop in some cases of pernicious anemia to the potent tion of absorption of physiological doses of vitamin B_{12}. If resi ance occurs, parenteral therapy, or oral therapy with so-call massive doses of vitamin B_{12}, may be necessary. No single re men fits all cases, and the status of the patient observed follow-up is the final criterion for adequacy of therapy. Perio



You can treat combined deficiencies with

Trinsicon®

—the multifactor hematinic

Vitamin B_{12} plus intrinsic factor (15 mcg. B_{12} activity)—helps provide adequate levels of this important vitamin.

Folic acid (1 mg.)—treats nutritional macrocytic anemias and/or malabsorption syndromes.

Ascorbic acid (75 mg.)—augments the conversion of folic acid to its active form and helps iron absorption.

Iron (110 mg.)—treats hypochromic anemia.

clinical and laboratory studies are considered essential and are recommended.

Adverse Reactions: In rare instances, iron in therapeutic doses produces gastro-intestinal reactions, such as diarrhea or constipation. Reducing the dose and administering it with meals will minimize these effects.

In extremely rare instances, skin rash suggesting allergy has ollowed oral administration of liver-stomach material. Instances of apparent allergic sensitization have also been reported after oral administration of folic acid.

Dosage: One Pulvule twice a day. (Two Pulvules daily produce a standard response in the average uncomplicated case of pernicious anemia.)

How Supplied: Pulvules Trinsicon® (hematinic concentrate with ntrinsic factor, Lilly), in bottles of 60 and 500. [032868]

Now . . . a new
alternate salicylate product
from Warren-Teed

magan®

an alternate salicylate

Magan®
(magnesium salicylate, W-T)

particularly offered for the management of those chronic arthritic and rheumatic patients with gastrointestinal intolerance to aspirin and other salicylates

pain relief comparable to aspirin

Magan may provide effective salicylate therapy for a substantial number of your patients who cannot tolerate other salicylates because of gastrointestinal irritation.

Magnesium salicylate is recognized as a safe and effective alternate to aspirin. A controlled clinical study showed Magan to be not significantly different from aspirin as an analgesic in the treatment of arthritic patients.[1]

Reports from a private practice experience study indicate that Magan was tolerated by a high percentage of patients judged by their physicians to be unable to take aspirin or other salicylates due to gastrointestinal intolerance.[2]

1. Stern, S.B.: Med. Times, Oct. 1967
2. Reports on 1200 patients, data in files, Warren-Teed Pharmaceuticals, Inc. 1966

(See next page for prescribing information)

A different salicylate structure—
with no coating, no buffering
and it is sodium free

magan®
(Magnesium Salicylate, W-T)

microphotograph of magnesium salicylate crystals

Composition: Each orange-colored compressed tablet contains 5 grains (approximately 325 mg.) of magnesium salicylate, W-T (salicylic acid equivalent 75%).

Actions, Indications, Uses: The analgesic, anti-inflammatory, and antipyretic effects of MAGAN are similar to those of aspirin and other salicylates. Accordingly, MAGAN is indicated for the treatment of rheumatoid arthritis, osteoarthritis, nonarticular rheumatism such as bursitis, painful-shoulder syndrome, tendosynovitis, fibrositis, and other musculoskeletal disorders. The drug is also useful for the symptomatic relief of pain, aches, and discomfort of headache, neuralgia, minor injuries, dysmenorrhea, common cold and other minor infections of the respiratory tract. MAGAN (Magnesium Salicylate) may be tolerated by some persons intolerant to aspirin by reason of gastrointestinal irritation.

Contraindications: Because of the danger of hypermagnesemia, MAGAN is contraindicated in cases involving advanced chronic renal insufficiency. MAGAN, as other salicylates, may counteract the effect of uricosuric agents, and should not be prescribed for patients on such drugs.

Warning: As with all salicylates, high dosages of MAGAN should be avoided entirely or administered with caution to patients with liver damage, preexisting hypoprothrombinemia, vitamin K deficiency, and before surgery.

Adverse Reactions and Precautions: The same precautions applicable to salicylate therapy in general should be followed in prescribing MAGAN. Appropriate precautions should be taken in prescribing MAGAN for persons known to be sensitive to salicylates. If reaction develops, drug should be discontinued. Dosages of anticoagulants should be reduced with the administration of high dosage levels of MAGAN. *Impaired Renal Function:* Appropriate precautions should be taken in administering MAGAN to patients with any impairment of renal function including discontinuing other drugs containing magnesium and monitoring serum magnesium levels particularly if dosage levels of MAGAN are high. *Salicylate Poisoning:* Symptoms of salicylism, resulting from high doses of MAGAN, can be expected to resemble closely in character and intensity those associated with aspirin poisoning. These range from dizziness, drowsiness and ringing in the ears to vertigo, convulsions, coma and hypokalemia. Salicylate poisoning can be treated by intravenous fluids with sodium bicarbonate or lactate and potassium supplementation. In very severe cases, hemodialysis may be necessary. Vitamin K, 5-20 mg. orally or slowly i.v., usually restores the prothrombin time to normal.

Dosage: Adults 1 or 2 tablets every 4 hours as required with a full glass of water. In arthritis and other rheumatic conditions, higher doses may be used at the discretion of the physician. The experience with MAGAN in children is limited. The drug should not be used, therefore, for patients below 12 years until indications for use and dosage have been established.

How Supplied: Bottles of 250 and 1000 tablets.

Enduron: (methyclothiazide) A basic building block for mild hypertensives

METHYCLOTHIAZIDE
ENDURON
METHYCLO-THIAZIDE
5 mg

Excellent day-long Na^+ output, yet easy on the K^+

Enduron provides an excellent starting therapy. Your patient's sodium excretion is greatly enhanced. Yet potassium loss is low.

The therapeutic action is smooth, and persists for a full 24 hours. With Enduron you can prescribe convenient once-a-day dosage without skimping your patients on day-long thiazide effectiveness.

Of course, as with all thiazides, supplemental dietary potassium should also be considered.

Use Enduron as a basic therapy in patients with mild to moderate hypertension. A single 5-mg. tablet each day is ample in most cases.

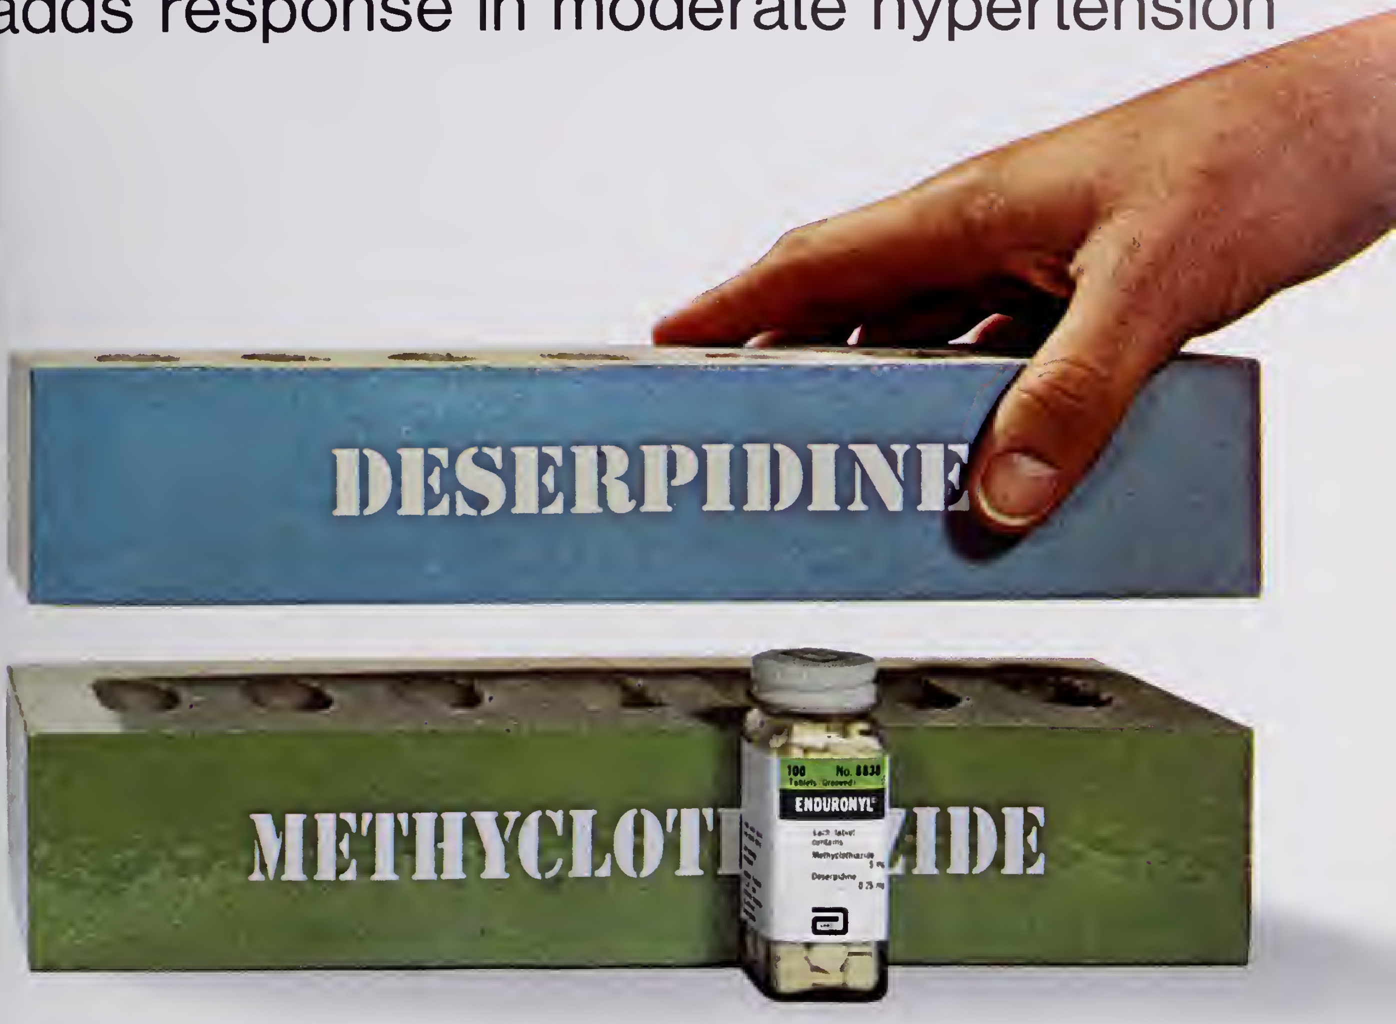
Once a day, every day

ENDURON®

METHYCLOTHIAZIDE

See Brief Summary on final page of advertisement

Enduronyl: Its deserpidine component adds response in moderate hypertension



DESERPIDINE
METHYCLOTHIAZIDE
100 Tablets (Grooved) No. 6838
ENDURONYL

Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.

Once a day, every day

ENDURONYL®

METHYCLOTHIAZIDE 5 mg. with
DESERPIDINE 0.25 mg. or (FORTE) 0.5 mg.

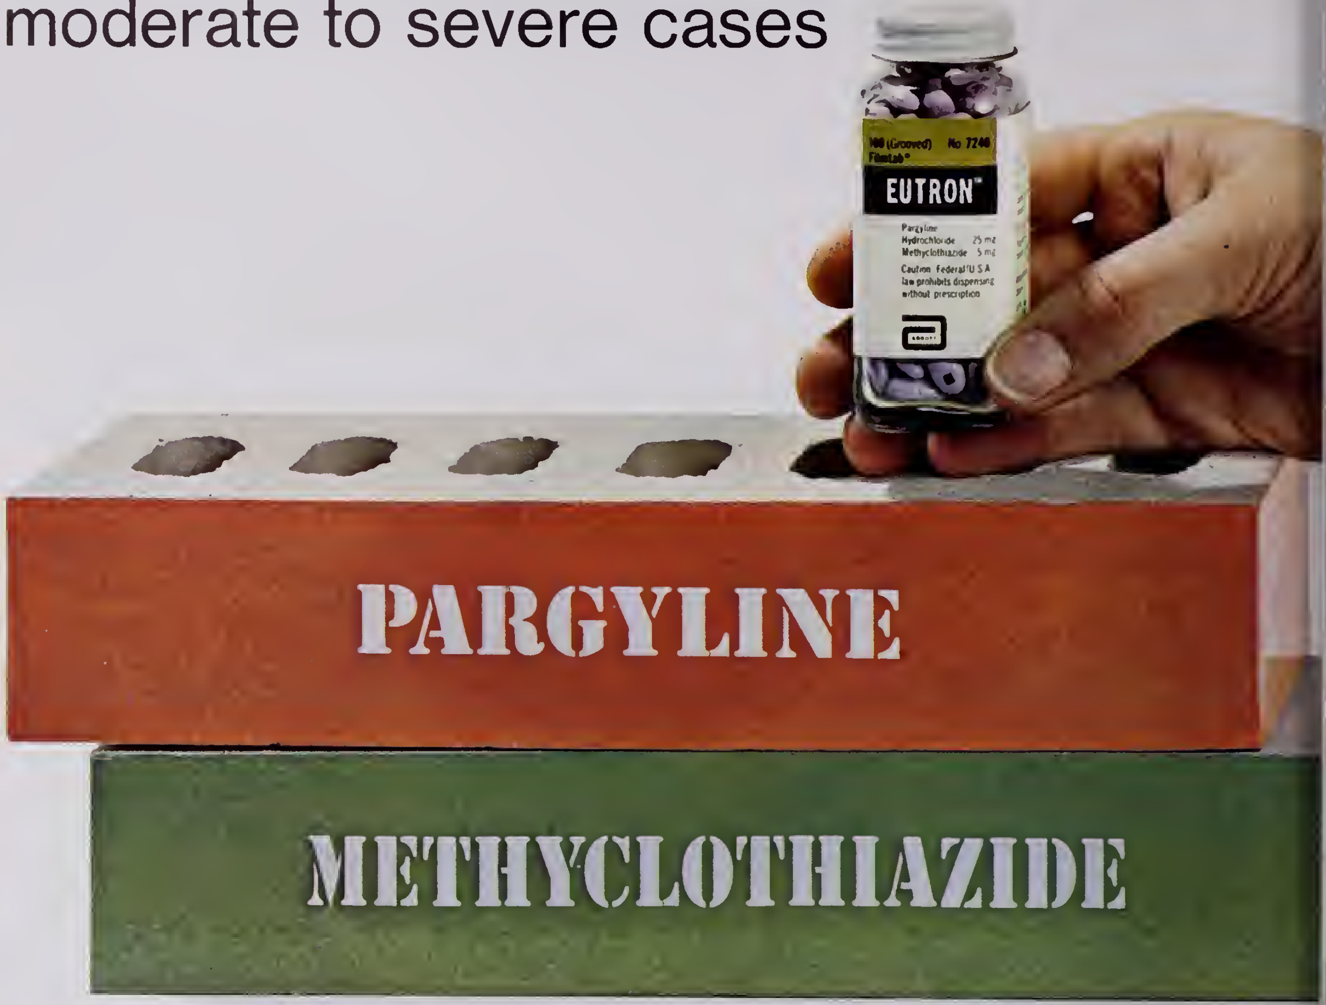
Eutron: A unique combination for handling moderate to severe cases



100 (Grooved) No 7240
Filmtab®
EUTRON™
Pargyline Hydrochloride 25 mg
Methyclothiazide 5 mg
Caution Federal/U.S.A. law prohibits dispensing without prescription
PARGYLINE
METHYCLOTHIAZIDE

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether your patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings were reduced from 112 pre-treatment to 90 post-treatment; *sitting* from 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearly alike in all three body positions.

Use Eutron for managing your moderate to severe cases. Its building blocks enhance each other; hence lesser doses often suffice.

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

801094

ENDURON® | ENDURONYL®

METHYCLOTHIAZIDE

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications—Moderate to severe hypertension.

Contraindications—Pheochromocytoma, paranoid schizophrenia, hyperthyroidism and advanced renal failure. Not recommended in malignant hypertension, children under 12, pregnant patients.

Do not use with: centrally or peripherally acting sympathomimetic drugs; foods high in tyramine (e.g., aged and natural cheeses); parenteral reserpine or guanethidine; imipramine, amitriptyline, desipramine, nortriptyline or their analogues; other monoamine oxidase inhibitors; methyldopa or dopamine; separate Eutron and these agents by two weeks.

Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease; impending hepatic coma from thiazide-induced hypokalemia.

Warnings—Patients: 1. No other drugs (particularly "cold preparations" and antihistamines), cheese or alcohol without physician's consent. 2. Promptly report orthostatic symptoms, severe headache, other unusual symptoms. 3. Angina pectoris or coronary artery disease patients must not increase physical activity with improved anginal symptoms or well-being.

Physicians: 1. Use antihistamines, hypnotics, sedatives, tranquilizers and narcotics (meperidine contraindicated) cautiously in reduced doses. 2. Stop Eutron two or more weeks before elective surgery; in emergency surgery reduce premedication (narcotics, sedatives, analgesics, etc.) to 1/4 to 1/5; carefully adjust anesthetic dosage to patient response. 3. Use cautiously in advanced renal failure. 4. Pargyline may induce hypoglycemia. 5. Consider possible sensitivity reactions when a history of allergy or asthma is present. 6. If potassium is indicated, dietary supplement is recommended; enteric-coated potassium tablets may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation frequently requiring surgery; discontinue medication immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs; Eutron does not contain added potassium. 7. Possible systemic lupus erythematosus has been reported for thiazides.

Precautions—Pargyline: Use cautiously at reduced dosage: caffeine, alcohol, antihistamines, barbiturates, chloral hydrate, other hypnotics, sedatives, tranquilizers, narcotics. Periodically do urinalyses, blood counts, liver function tests, etc. Use with caution in liver disease. Watch for orthostatic hypotension, especially in impaired circulation (e.g., angina pectoris, coronary artery disease, cerebral arteriosclerosis); also, augmented hypotension in concomitant febrile illnesses. Reduce or discontinue if hypotension is severe. In impaired renal function watch for cumulative drug effects, elevated BUN and other evidence of progressive renal failure; withdraw drug if these persist. In surgery increased central depressant response (hypotension and increased sedative effect) can be controlled by (1) discontinuing at least two weeks prior; (2) in emergency surgery lowering dose of premedication; (3) when necessary, administering a vasopressor. Do not use in hyperactive and hyperexcitable patients. Pargyline may unmask severe psychotic symptoms where emotional problems pre-exist. Use cautiously in Parkinsonism, especially with antiparkinsonian agents. In prolonged therapy, examine for change in color perception, visual fields, fundi and visual acuity. Also, prolonged therapy has made certain patients refractory to nerve blocking effects of local anesthetics.

Methyclothiazide: Use cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery thiazide may reduce vasopressor response and increase tubocurarine response. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia). Give supplemental chloride if hypochloremic alkalosis occurs and supplemental potassium if hypokalemia occurs (especially in digitalized patients). Thiazides may decrease serum P.B.I. without signs of thyroid disturbance.

Adverse Reactions — Pargyline: Orthostatic hypotension and associated symptoms, mild constipation, fluid retention, edema, dry mouth, sweating, increased appetite, arthralgia, nausea, vomiting, headache, insomnia, difficult in micturition, nightmares, impotence, delayed ejaculation, rash, purpura, weight gain, hyperexcitability, increased neuromuscular activity and other extrapyramidal symptoms. Drug fever is extremely rare. Reduction in blood sugar and hypoglycemic effects are possible. Congestive heart failure has been reported in a few patients with reduced cardiac reserve.

Methyclothiazide: Blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, blood sugar or serum uric acid (gout may be induced); anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice and pancreatitis. Cutaneous vasculitis in elderly patients has been reported with other thiazides.

If side effects are severe or persist, reduce dosage or withdraw drug. 804438R

LEGAL

State Supreme Court Rules MD Not Permitted To Testify in DO Suit

(Editor's Note: The following article is quoted from the AMA Citation newsletter of June 15, 1968, prepared by the AMA Law Department.)

In a patient's suit against an osteopath for injuries caused by his allegedly negligent performance of an oophorectomy, a trial court properly refused to permit an allopathic physician to testify as to the standards of osteopathic practice because the physician expressly denied having any knowledge as to the standards applicable to osteopathy. If he had knowledge of such standards, the Michigan Supreme Court said, he would have been qualified to testify. A new trial was ordered because of the trial court's refusal to allow the patient to call as an adverse witness a second osteopath, who had assisted in the operation.

The patient's right ureter was cut during the operation. The osteopath inserted a catheter in the opening of the ureter and closed the opening with sutures. The osteopath had intended leaving a Penrose drain in place over the urethral repair, but he overlooked doing so until the wound was completely closed. He decided not to reopen the abdomen, because he considered the urethral repair secure. When a systoscopic examination disclosed that the ureter's peristaltic action was expelling the catheter, the catheter was removed with forceps and a Foley catheter placed in the urinary bladder. A blockage of the ureter developed, which made another operation necessary.

During cross-examination on his qualification as an expert witness, the physician called by the patient stated that he knew nothing of the standards, procedures, and techniques of osteopaths. On redirect examination, he was asked if he was familiar with the standards of osteopaths in performing oophorectomies. The osteopath's objection to the question, based on the physician's prior admission that he was unfamiliar with osteopathic standards, was sustained. An offer of proof was made that the physician would have testified that the standards for performing oophorectomies were the same for physicians and osteopaths. Since the physician had stated, without qualification, on cross-examination that he was unfamiliar with

osteopathic standards, he could not be permitted on redirect examination to contradict that testimony, even in part, in the face of the osteopath's timely objection. Thus, the sustaining of the objection was not reversible error.

However, the appellate court was incorrect in stating that the general rule prohibits opinion testimony from a medical practitioner solely because he is not a practitioner of the same school of medicine as the practitioner whose standards of practice are in issue. The Supreme Court said that, although there was language in some cases which suggested that such was the rule, it had never directly decided the specific question. The proper rule is that the standard of exclusion is not the school of the witness but his knowledge of the standards of the practitioner whose standards are in issue. In malpractice cases, the opinion testimony of a witness knowledgeable on the standards applicable to the profession of the practitioner against whom suit is brought and his compliance or noncompliance with those standards, is admissible, even though the witness does not practice the same profession or belong to the same school of healing as the practitioner against whom suit is brought.

In view of the physician's express disclaimer of knowledge of osteopathic standards, his testimony was not admissible under the "exception" referred to by the patient, which permits a witness of a school of medicine different from that of the practitioner against whom suit is brought to testify as to matters on which the principles of the two schools concur. — *Frazier* v. *Hurd*, 157 N.W.2d 249 (Mich., April 1, 1968) □

(Editor's Note: The decision of the appellate court was reported in THE CITATION, Vol. 15, No. 4, p. 58.)

USPHS TO STUDY HEALTH OF KENT COUNTY TEEN-AGERS

The U.S. Public Health Service will examine 200 Kent County young people, ages 12-17, during a three-week period beginning August 21, as part of a nationwide survey to ascertain the health of American teen-agers.

The health examinations, which will be conducted in the Survey's mobile center, are designed to collect data primarily on the health aspects of growth and development. The Survey is not intended as a screening procedure; referral for diagnosis is not made.

Parents of each youth examined are told that the examination is neither complete nor can be looked upon as a substitute for a visit to one's own physician and dentist, the Public Health Service explains. □

Why MDPAC-AMPAC? What's It All About?

BY VERNON V. BASS, M.D.
CHAIRMAN, MDPAC
SAGINAW

Making laws is one of this nation's major activities. It keeps Congress busy for nearly eleven months out of twelve these days. Fifty state legislatures add thousands of laws more each year. Cities contribute a flood of ordinances to the total. The regulatory agencies crank out regulations in awesome numbers.

With the effect this entire process has on a business, an industry, a profession, a group of people, or the individual taxpaying citizen who must conform to the rulings of the legislative majority, it would seem logical to expect breathless attention to all these goings-on from every person of voting age in the United States. But as all of us know, it doesn't work out that way. Not one person in five is a political activist in the sense that he works for the political party of his choice, supports it financially to the degree that he is able, or turns a hand to the necessary work of helping a candidate win.

Until recent years, business, industry and the professions limited their activities to lobbying for specific legislative proposals.

THIS ATTITUDE IS CHANGING. Clearly, a loner in politics accomplishes little more than the casting of his single vote, important though that is. Just as clearly, a group of like-minded individuals can multiply their political effectiveness. Nothing prevents separate political groups like MDPAC from forming, on the basis of a shared point of view, and then working for a particular candidate as an auxiliary to his party organization during a three or four month campaign.

The new look in candidate support committees is different. They now function as parts of a permanent organization tied to neither party.

They are candidate oriented, but work for a selected candidate only during his campaign. They then sever the relationship until the next time the office is being contested and may, if they chose, decide at that time based upon the candidate's record, to support someone else.

These political hybrids are the new political action committees, of which MDPAC is one, and they are not only here to stay but constitute a force of growing power.

AUTONOMOUS POLITICAL action committees are now operating in each of the fifty states as well as in the District of Columbia, with members belonging to their State PAC and AMPAC as well.

Candidates are chosen by PAC members at the local level on the basis of political principles, chance to win, need for help, and several other factors. The PAC members within a Congressional District then set out to form a candidate support committee, raise money, and provide volunteer services for the candidate they choose.

If additional financial help is needed, the district candidate support committee applies to the State PAC. Political realism governs that decision.

Recognizing that able, intelligent candidates are to be found within the ranks of both political parties, MDPAC and AMPAC are resolutely bipartisan.

AMPAC is involved primarily in races for the

House, but has worked effectively in campaigns for the U.S. Senate.

The Michigan Doctors Political Action Committee is oriented to key congressional contests, but also involves itself in campaigns for the state legislators as well as other selected educational and judicial posts.

The American Medical Political Action Committee (AMPAC) was formed with the American Medical Association's official blessing as a voluntary, non-profit, unincorporated organization whose purpose was to help its members participate effectively in public affairs; further their political knowledge; and develop the means for concerted political knowledge; and develop the means for concerted political action.

AT THE NATIONAL LEVEL, AMPAC seeks to provide coordination, liaison and political training for its members. In terms of this training, a variety of political education programs is made available for use by MDPAC members. Courses in precinct action, films on politics, pamphlets on how to form political opinion, a membership periodical, exhibits are some of the materials AMPAC produces and disseminates. In essence, this sort of political education is comparable to the programming done by many of the public affairs departments of the nation's large corporations.

DOES THIS OVER-ALL approach work?

It does indeed.

AMPAC is now second only to labor in the total of its dollar support to Congressional candidates. And AMPAC's files are filled with testimonials from political candidates who believe that the margin between their defeat and victory at the polls was provided by the combined effort of physicians and their wives.

In these troubled days when Congress is called upon to consider a plethora of bills involving the nation's health medicine clearly has a gigantic stake in the election of intelligent men and women who will at least listen to the point of view of medical authorities before they make up their minds on proposed health legislation.

Medicine's PAC movement both at the national and state levels is helping to assure the election and re-election of such people, recognizing that legislative arguments minus candidate support often equal futility squared.

The MDPAC board is currently assessing the voting record of all legislators and will financially support on a bipartisan basis over fifty candidates for the 1969 legislature. Several members of the Michigan delegation to the Congress have likewise been recipients of MDPAC funds. Much more help is needed particularly by candidate support committees. MDPAC has doubled its membership in 1967. It is now approaching 30% of MSMS membership. This is due in part to billing procedures used in all counties except Wayne County.

MDPAC's EFFECTIVENESS could develop into a brilliant political success story. It needs your help to accomplish this, and in the 1968 election year a membership of at least a third of Michigan doctors is essential.

For twenty-five dollars ($25.00) become a member of both AMPAC and MDPAC. Mail your check to MDPAC, Box 169, East Lansing, Michigan 48823. Join the team! ☐

MSMS CONTINUES PAP TEST APPEAL

Daily and weekly newspapers throughout Michigan continued to carry the appeal of the MSMS Cancer Committee to Michigan women to have Pap tests.

Some of the headlines on the MSMS news release read:

Union Lake Spinal Column: "Cancer Check-ups Save Lives."

Detroit West Side Courier: "Urge Women Have Cancer 'Pap' Test."

Lansing State Journal: "Annual 'Pap' Test Needed."

Holly Herald-Advertiser: "Urge Women to Take 'Pap' Test."

Belleville Enterprise-Roman: "Physicians Advise Yearly 'Pap' Test to Spot Cancer."

Trenton Times: "Doctors Call Lack of 'Pap' Tests 'Tragic'."

TELLS GRADUATES EXPAND HORIZONS

Austin Smith, M.D., chairman of the board of Parke, Davis & Company, recently challenged the graduating seniors of the Massachusetts College of Pharmacy and Science to play a greater individual role in modern society.

Doctor Smith, who also received the college's 31st honorary degree, a "Doctor of Science in Pharmacy," urged students to expand their professional and personal horizons following graduation. "The greatest profession of all lies before you — the profession of living," he said. "The need to grow, to expand one's horizons, to realize that we cannot, as a professional person, or as a private individual, live in an isolated world, oblivious to outside influence or change.

IN MEMORIAM

F. J. Fitzpatrick, M.D., Pontiac

Francis J. Fitzpatrick, M.D., Pontiac internist for 41 years, died May 22. He was 70.

Doctor Fitzpatrick was a Life Member of MSMS and an honorary member of the staff at St. Joseph Mercy Hospital, Pontiac. He was graduated from the University of Michigan Medical School in 1924. He was a Diplomate of the Board of Internal Medicine and a member of Nu Sigma Nu medical fraternity.

W. E. McGillicuddy, M.D., Dearborn

Walter E. McGillicuddy, M.D., retired Dearborn otolaryngologist, died April 5 at the age of 86.

Doctor McGillicuddy, a 1913 graduate of the Detroit College of Medicine and Surgery, practiced pharmacy in Ontario and Detroit for a number of years. During World War I he served in the U.S. Army in France as an anesthetist. He formerly was on the staff of the Detroit Eye, Ear, Nose and Throat Hospital for eight years and was also affiliated with the Detroit T.B. Sanitarium.

He was an active member of the Masons and traveled extensively, visiting various hospitals in the interest of welfare work for Masonic organization. His hobbies were fishing and hunting and he was a member of the Paul Bunyon Conservation Club, French River Fishing Club, Canada Bon Ami Hunting Club and the Harmonie Society of the Canada Creek Ranch Association.

F. T. Reid, M.D., Birmingham

Fred T. Reid, M.D., Birmingham, died June 12 at the age of 71. Doctor Reid had practiced in the Detroit area since he received the M.D. degree from the University of Michigan Medical School in 1923.

His internship was at Grace Hospital, and he was a member of staff at Grace Hospital, St. Joseph's Mercy Hospital in Pontiac, and Ardmore Hospital in Ferndale. He served as a health officer at Clawson and received a 25-year service award as a Selective Service examiner.

He was a Life Member of MSMS, and had been a member of the Board of Directors of the Oakland County Medical Society.

INGRAM'S SERVICE DEPARTMENT

ALL FACTORY TRAINED MEN

We service Medical Equipment, Electrocardiographs, Basal Metabalors, Sterilizers, Autoclaves, Diathermy Outfits, Cutting Units, Ultra Violet Lamps, Hydro Therapy Units, Laboratory Equipment. ALL BURDICK, LIEBEL FLARSHEIM AND RITTER EQUIPMENT.

THE G. A. INGRAM COMPANY

4444 Woodward Avenue TEmple 2-4444 Detroit, Michigan 48201

M. N. Southworth, M.D., Kalamazoo

Maynard N. Southworth, M.D., Kalamazoo general practitioner, died June 10 at the age of 62.

Doctor Southworth received the M.D. degree from the University of Michigan Medical School in 1930. He was affiliated with Borgess and Bronson hospitals in Kalamazoo and had served as a township health officer. From 1942 to 1946 he served in the Medical Corps. He was a member of the American Legion, the Elks Club and Theta Kappa Psi medical fraternity.

H. A. Sullivan, M.D., Detroit

Hugh A. Sullivan, M.D., surgeon at Harper Hospital, Detroit, for over 50 years, died June 1. He was 75.

Before his retirement, he was chief surgeon for the Department of Streets and Railways of Detroit for 42 years. He also served as a surgeon for the Detroit Police Department for 30 years.

He received his medical education at the Detroit College of Medicine, graduating in 1915. During World War I, he served on a surgical team headed by neuro-surgeon Harvey Cushing and later with Harper Hospital Base #17 in France.

Doctor Sullivan was a founding member of the American Board of Surgery and was a past president of the Detroit Academy of Surgery in 1942. He was a Life Member of MSMS and a member of the American College of Surgery and Phi Beta Pi.

G. C. Tornberg, M.D., Cadillac

Gordon C. Tornberg, M.D., Cadillac physician, died May 26 at the age of 55.

He had served as president and secretary of the Wexford-Missaukee County Medical Society and was an examiner for the Selective Service Board for 15 years. Active in community affairs, he was a member of the Chamber of Commerce, Rotary Club and Cadillac Club.

Doctor Tornberg practiced in Cadillac from 1940 until several years ago. He was a 1939 graduate of the University of Minnesota Medical School and also held a B.S. degree from the University of Michigan. His internship was served at St. Mary's Hospital, Duluth, Minnesota.

HPCM MOVES

The Health Planning Council of Michigan has moved from its present offices at 414 Hollister Building, Lansing to new quarters at 2213 East Grand River, Lansing, Michigan 48912. The telephone number, 482-5529, remains unchanged.

Established 1924

MERCYWOOD HOSPITAL

A model of the Grand Rapids Public Museum area which will house a major new medical and health display is explained by Weldon D. Frankforter, right, museum director, to Charles Farber, M.D., left, president of the Kent County Medical Society; Frederick Brace, M.D., second from left, and James Muldoon, M.D., third from left.

Kent Doctors Provide Museum Health Display

A display of transparent human figures, fitted with tape-recorded "voices," will soon become a central part of a new major display at the Grand Rapids Public Museum thanks to a $25,000 grant from the Kent County Medical Society.

A complete "growth and development" series of displays will also be included to show the process of conception and birth.

"This will be a permanent medical exhibit showing the physical development of man," said Charles Farber, M.D., president of Kent County Medical Society. "We, the physicians of Grand Rapids, are taking the initial step in establishment of this exhibit, and it is our hope that the exhibit will be enlarged and extended to eventually include all fields of health."

Planning for the display, which will be a reality by the fall of 1969, has been done by a special committee of the Medical Society, headed by James Muldoon, M.D., of Grand Rapids and working closely with Weldon D. Frankforter, Museum Director. Also active on the committee is Fred Brace, M.D., of Grand Rapids. ☐

Parke, Davis Adds New Jersey Firm

Parke, Davis & Company has purchased the assets of the PanAura Corporation, of Pennsauken, N.J., a subsidiary of Kewanee Oil Company. The PanAura included the prototypes of several medical electronic products, patents, inventions, and electronic laboratory equipment. ☐

Diarrhea
TROCINATE® 400 MG.
BRAND THIPHENAMIL HCl.

The relief received from the first Trocinate 400 mg. tablet is so prompt that the discomfort of diarrhea ceases to be a bother. May be repeated every four hours.

Upon request, a supply of Trocinate 400 mg. with literature will be sent to physicians for their personal use.

in the treatment of

IMPOTENCE

Android®

(thyroid·androgen) TABLETS

Effectiveness confirmed by another double blind study*

1. SUMMARY

ANDROID	GOOD TO EXCELLENT 75%
PLACEBO	20%

2. Forty cases reported.
3. Cites synergism between androgen and thyroid.
4. No side effects in patients treated.
5. Alleviation of fatigue noted
6. Case histories on 4 patients.
7. Although psychotherapy still needed, role of chemotherapy cannot be disputed.

*"Sexual impotence treatment with methyl testosterone – thyroid (ANDROID) a double blind study" – Montesano, Evangelista: Clinical Medicine, April 1966.

CONTRAINDICATIONS—Methyl testosterone is not to be used in malignancy of reproductive organs in male, coronary heart disease. Thyroid is not to be used in heart disease, hypertension unless the metabolic rate is low.

Choice of 4 strengths

Android

Each yellow tablet contains:

Methyl Testosterone	2.5 mg.
Thyroid Ext. (1/6 gr.)	10 mg.
Glutamic Acid	50 mg.
Thiamine HCL	10 mg.

Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-HP

HIGH POTENCY

Each red tablet contains:

Methyl Testosterone	5.0 mg.
Thyroid Ext. (½ gr.)	30 mg.
Glutamic Acid	50 mg.
Thiamine HCL	10 mg.

Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-X

EXTRA HIGH POTENCY

Each orange tablet contains:

Methyl Testosterone	12.5 mg.
Thyroid Ext. (1 gr.)	64 mg.
Glutamic Acid	50 mg.
Thiamine HCL	10 mg.

Dose: 1 or 2 tablets daily.
Available:
Bottles of 60, 500.

Android-Plus

WITH HIGH POTENCY
B-COMPLEX AND VITAMIN C

Each white tablet contains:

Methyl Testosterone	2.5 mg.
Thyroid Ext. (¼ gr.)	15 mg.
Ascorbic Acid (Vit. C)	250 mg.
Thiamine HCL	25 mg.
Glutamic Acid	100 mg.
Pyridoxine HCL	5 mg.
Niacinamide	75 mg.
Calcium Pantothenate	10 mg.
Vitamin B-12	2.5 mcg.
Riboflavin	5 mg.

Dose: 2 tablet twice daily.
Available: Bottles of 60, 500.

Write for literature and samples:

REFER TO PDR

also available with ESTROGEN

Android-E

Each Tablet Contains:

Methyl Testosterone	2.5 mg.
Ethinyl Estradiol	0.02 mg.
Thyroid Ext. (1/6 gr.)	10 mg.
Thiamine Hydrochloride	10 mg
Glutamic Acid	50 mg.

INDICATIONS: Advantage is taken of the anabolic action of ANDROID without its virilizing effect. Estrogen balances the androgen—only steroid effect remains. Geriatrics, post-operative and debilitating disease, osteoporosis. **DOSE** One tablet t.i.d. Female patients should have a rest period 5 to 7 days after 21 days of medication. **SIDE EFFECTS**: In the female, excessive dosage may produce virilizing effects of most androgens: hoarseness, hirsutism, enlarged clitoris. Symptoms can be avoided by keeping the dosage below 300 mg. of testosterone per month. **CONTRA-INDICATIONS**: See Android. Ethinyl estradiol is not to be used in latent malignancy of reproductive organs or mammary glands.

Tandearil® in Osteoarthritis
oxyphenbutazone

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: Tandearil is an analog of phenylbutazone; sensitive patients may be cross-reactive. If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia), sudden weight gain (water retention), skin reactions, black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension, the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reacti-

"Pain Break" for an osteoarthritic.

Tandearil can usually ease it.

At 46, her knees still look good on the outside. But inside, there may be the familiar picture of osteoarthritis.

If aspirin doesn't help, Tandearil often will. Pain and stiffness begin to ease up in 3 or 4 days. You can often maintain response with a daily dose of only 1 or 2 tablets.

Of course, Tandearil is not for every osteoarthritic. Select your patients carefully and follow them in line with the Contraindications, Precautions, Warning, and Adverse Reactions listed below.

But for many aspirin-stubborn osteoarthritics, let Tandearil ease the unwelcome pain breaks of osteoarthritis.

Tandearil®
oxyphenbutazone

vate a latent peptic ulcer. The patient should be instructed to take doses immediately after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis) or a generalized allergic reaction similar to a serum sickness syndrome may occur and require permanent withdrawal of medication. Agranulocytosis can occur suddenly in spite of regular, repeated normal white counts. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity, angiitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

For complete details, please see full Prescribing Information.

Dosage in Osteoarthritis: Initial: 3 to 6 tablets daily in divided doses. Usually unnecessary to exceed 4 tablets daily. A trial period of one week is considered adequate to determine the therapeutic effect of the drug. Maintenance: Effective level often achieved with 1 or 2 tablets daily, should not exceed 4 tablets daily. In selecting appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and other factors influencing drug response.
Availability: Tan, round, sugar-coated tablets of 100 mg. in bottles of 100 and 1000.

For Achievers, Pleasure Plus Pride is a Boat

A boat is a special thing, not for everyone. Doers, achievers, those more alive than most, are the ones who embrace the mystique of boating most readily. Whether sail or power, a boat is a refuge, or a party place, an art to be mastered, language to be learned and used, a means of exciting travel, a catalyst for friendships, a thing of great beauty, a source of much pride and a grandstand seat for many of nature's most wondrous spectacles. And if needed, a boat can be prestige and an outlet for competitive drive.

More perceptive than most of us, doctors are particularly aware of the benefits of boating and have gone to sea in proportionately larger numbers than has any other profession. That's why we sell boats to so many doctors.

Palmer Johnson has been serving the needs of yachtsmen for 50-years. We know boats. We live boats. And, best of all, we like boats and those who like boats.

If you're ready for a boat, we're the people to talk with. No matter if you're an old salt looking for something bigger, better, or a new sailor considering his first yacht, we're sure to have just the right boat for you, your family and your pocketbook. Sail or power, large or small, new or recommissioned, direct sale or brokerage, we'll give you our best thinking and recommendations.

Palmer Johnson represents such famous names as BRISTOL & SAILSTAR, CAL, CUTHBERTSON, HUGHES, MATTHEWS, MORGAN, OWENS, PEARSON, ROAMER and SWAN. And, being unusually skilled in aluminum, and wood, our Sturgeon Bay yard can build custom yachts of superb quality and value.

We are a full service organization and offer complete care, maintenance and storage. And we have slips available, with potable water and electricity.

Doctor, if you're ready for a boat . . . and even if you aren't . . . we invite you to visit us, in Racine. You'll find it interesting. And who knows, maybe you'll be one of the next achievers we'll send off to sea.

Another step forward in Ultrasonics The Burdick UT/420 Continuous or Pulsed Ultrasound

Burdick introduces its newly designed UT/420 Ultrasound! Handsomely styled, the new UT/420 produces a combination of thermal, mechanical, and chemical effects in tissue not possible with any other modality. Selection of continuous or pulsed energy offers flexibility of treatment—pulsed ultrasound permits increased mechanical effects at higher intensities without pain.

Ask your Burdick dealer about the UT/420 (he has an Ultrasound Dosage Chart for you as an aid to more effective treatment)—or write us.

painful night
leg cramps...
respond to specific
therapy with
QUINAMM™
(Quinine sulfate, 260 mg.,
Aminophylline, 195 mg.)

Just one tablet at bedtime • Prevents painful night leg cramps • Permits restful sleep

How many of your patients stamp their feet at night and lose sleep because of painful leg cramps? Unless prompted, they usually fail to report this distressing condition and suffer needlessly.

One tablet of QUINAMM at bedtime usually controls distressing night cramps and permits restful sleep with the initial dose.

Prescribing information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Side Effects/Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

MSMS Members In The News

BY CAROL MAXWELL
OF THE MSMS STAFF

Michigan
State
Medical
Society

Edward F. Knoschnabel, M.D., Marquette, is aboard the S.S. Hope on its second rotation in Ceylon from June 13 through August 15. He is the only otolaryngologist on the staff.

Joseph A. Witter, M.D., Highland Park, was honored by the medical staff of the Highland Park General Hospital at the annual dinner for his activities as chief of surgery at the Highland Park hospital from 1956 to 1968.

Michael S. Leahy, M.D., Ann Arbor, has been selected the outstanding resident of the year at the University Hospital. For his outstanding work as the senior resident in pathology, he will receive an honorarium and a certificate of achievement.

Paul T. Lahti, M.D., Royal Oak, and his associates were pleased to find in a recent article in *Time* quotations from Doctor Lahti's article "Early Postoperative Discharge of Patients from the Hospital," published in *Surgery,* March 1968.

David Hills, M.D., St. Joseph, has been named to head a committee to unify health planning in the St. Joseph-Benton Harbor area on a long-range basis.

Frederick J. Chapin, M.D., Bay City, immediate past president of the Bay, Arenac, Iosco Counties Medical Society, surprised members of the county society with his announcement that he would be leaving the pediatrics practice he has had there for 23 years. He will train in and practice psychiatry in Traverse City.

Michael J. Brennan, M.D., Detroit, has been named to the National Advisory Council on Regional Medical Programs of the National Institutes of Health. The Advisory Council assists in policy matters and in the preparation of regulations and also makes recommendations on grants.

Louis Carbone, M.D., Detroit, was saluted as a "physician to mankind, friend to St. John Hospital and contributor to his community" when he received the "Man of the Year" award of St. John Hospital, Detroit.

William H. Beierwaltes, M.D., Ann Arbor, told the Society for Nuclear Medicine recently in St. Louis that three cancer patients at the U-M Hospital have received a new diagnostic drug which apparently has revealed the extent of malignant melanotic tumors for the first time. The drug, NM-113, he said, is structured like chloroquine and contains a radioactive atom which quickly reveals its presence to photo-scanning instruments.

Harold F. Raynor, M.D., Detroit, recently received a Golden Anniversary Diploma from the WSU Alumni Association in recognition of his 50 years in medicine. Although retired from private practice since 1957, Dr. Raynor continues to work as associate medical director at the American Red Cross, Elizabeth Street, Detroit, and as a physician for the Highland Park Fire Department.

Sol C. Grossman, M.D., Huntington Woods, has been elected president of the Michigan Psychoanalytic Society for 1968-69. Other officers chosen are: vice-president, Saul Harrison, M.D.; secretary, Ira Miller, M.D., Ann Arbor; treasurer, Jack Dorman, M.D., Detroit.

Paul L. Lowinger, M.D., Detroit, spoke at Oxford, England, at the meeting of the Medical Association for Prevention of War. His topic was "Hospitals, Doctors, and Riots."

Fred W. Whitehouse, M.D., Detroit, is the newly-elected president of the Michigan Diabetes Association. He is Chief of the Metabolism Department of Henry Ford Hospital, Detroit.

Samuel J. Nichamin, M.D., Southfield, is the author of an article "Atypical Manifestations of the Recurrent Pleurodynia Syndrome in Children and Adolescents" in the April 1968 issue of *Clinical Pediatrics.*

Frederick C. Swartz, M.D., Lansing, chairman of the AMA Committee on Aging, was a featured speaker at a special half-day session on automated multiphasic screening programs during the recent AMA Annual Convention in San Francisco.

MICHIGAN MEDICINE

Annual Session, September 25-26 Offers Both Depth and Variety of Subjects

LIBRARY OF THE COLLEGE OF PHYSICIANS OF PHILADELPHIA
SEP 6 - 1968
8

"Our program this year," says Alexander J. Walt, M.D., chairman of the MSMS Annual Scientific Session program committee, "is designed for maximum impact to serve the needs of the practicing physician in the shortest space of time."

"We have shaped the program so that it provides both depth and variety in conveying the newest developments in scientific medicine to the practicing physician," Doctor Walt continued, in commenting on the over-all thrust of this year's September 25-26 meeting at the Sheraton-Cadillac Hotel in Detroit.

"There are several main features which I think will be of great interest to physicians," Doctor Walt said.

"FIRST, THE MSMS Annual Scientific Session is a concentrated two-day meeting," he continued.

"Through our new all-day postgraduate courses guest faculties will give in depth treatment to several important topics stressing the clinical and patient-care aspects. On Wednesday, September 25 we are offering all-day postgraduate courses on Infectious Diseases and on Pulmonary Diseases," he said. "On Thursday we will focus on Blood Diseases and on Difficult Decisions in Digestive Diseases."

"These postgraduate courses," Doctor Walt said, "will be on a limited enrollment basis only and I would encourage doctors to register for them as early as possible. We want to provide an intensive, seminar atmosphere so that the physician participant can get the maximum individual attention."

"SECONDLY, WE ARE having two large general sessions from 9:00 a.m. to noon on the important topics of Breast Carcinoma (Wednesday) and Heart Disease (Thursday)," Doctor Walt commented.

"In addition, there will be concomitant sessions on current problems in a wide variety of disciplines."

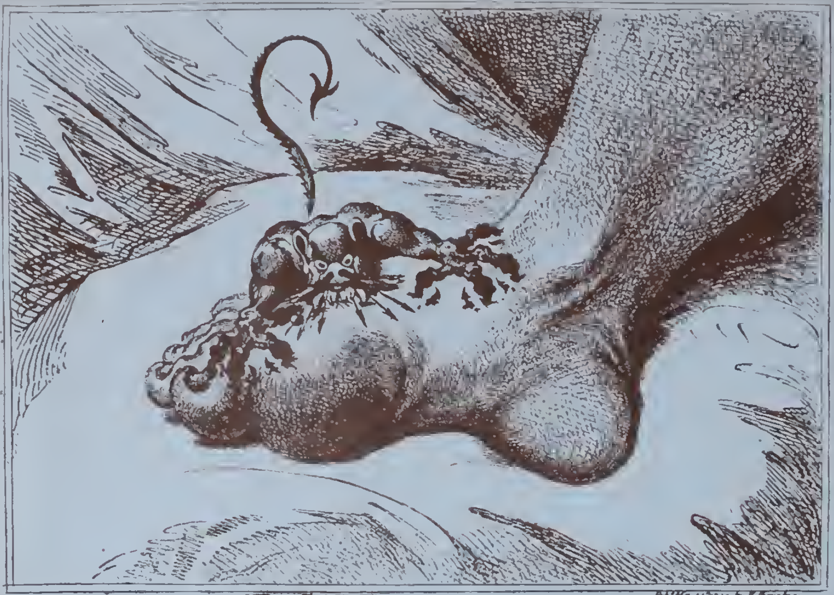
"THIRD, I WOULD like to draw the attention of physicians to the two outstanding luncheon speakers at the Annual Session," Doctor Walt added. "On Wednesday, Harry F. Dowling, M.D., of Chicago, will speak on 'Drugs, Doctors and Government.'

"On Thursday, David Hume, M.D., from the Medical College of Virginia, will speak on 'Organ Transplantations.'

"FINALLY, I THINK our Thursday afternoon General Session on 'What's New in the Practice Of' will be of special value to physicians.

"In conclusion, therefore, I think our program will be of high value for these reasons," Doctor Walt said. "Gathered for an intense two day session will be local, national and international medical authorities.

"THE PRACTICING PHYSICIAN can choose from the program according to his own needs: he can choose in depth study of a particular field or he can choose to learn the newest developments in fast-paced sessions which will cover a variety of topics."



The GOUT

"Ars Medica" Exhibit Coming To Detroit in September

MSMS members and wives are especially invited to view the **Ars Medica** exhibit of prints at the Detroit Institute of Arts during the MSMS Annual Session in Detroit, September 22-26. The special exhibit of prints depicting medical subjects is being brought to the Detroit Institute, for September 22 through October 20 through the joint efforts of the Institute and a special committee of Detroit area physicians.

The above colored etching entitled **The Gout,** was done in 1799 by James Gillray, of England, who lived from 1757 to 1815. More than 130 original works, obtained from the Philadelphia Museum of Art and purchased through special funds from Smith Kline & French Laboratories, includes woodcuts, engravings, eachings, lithographs, and serigraphs.

COMPLETES DETROIT SMOKING RESEARCH

Children exposed to tobacco smoke have twice as many respiratory diseases as do children in nonsmoking families, according to a recent health survey of 727 Detroit families, conducted by Paul D. Cameron, Ph.D., assistant professor of psychology at Wayne State University.

The study also disclosed that the more smoke children were exposed to, the greater their chances of being ill.

Bruce Leaves WSU To Join Oklahoma

Thomas A. Bruce, M.D., Professor of Medicine and Assistant Dean at the WSU School of Medicine, has resigned to become Professor of Medicine and Head of Cardiology in the Cardiovascular Division of the University of Oklahoma School of Medicine at Oklahoma City. A member of the WSU staff since 1961, he was appointed Assistant Dean in 1966. He earned his M.D. degree at the University of Arkansas.

MSMS, MNA Pla Nurse-Physician Confab, Soon

Twenty-five selected physician and 25 selected nurses will mee for an invitation-only "Conferenc on Strengthening Nurse-Physicia Relationships" September 4-5 a the MEA Conference Center at St Mary's Lake near Battle Creek.

Robert L. Tupper, M.D., chairman of the MSMS Committee or Nursing, will preside at an addres given by Floyd Mann, Ph.D., fron the Center for Research on Utilization of Scientific Knowledge, University of Michigan, on "The Effect of Nurse-Physician Relationships on Patient Care," on Wednesday evening September 4.

Participating in a discussion Sept. 5 on "The Changing Scope of Medical and Nursing Practice" will be a nurse and Glenn E. Moore, M.D., surgeon and vice-chief of the trauma section, Hurley Hospital, Flint. "Preparation for Changing Practice," will be discussed by Harold F. Falls, M.D., professor in the department of ophthalmology at the University of Michigan Medical School, and a nurse. "Merging and Emerging Areas of Practice" will be examined by Doctor Tupper and a nursing professor.

A special panel of members of the MSMS Committee on Nursing will discuss the final topic, "Colleagues in Collaboration—Toward Improved Patient Care." Panel members will be Shirley Austin, M.D., Gwendoline MacDonald, R.N., EdD, Dirk R. Mouw, M.D., and Theresa Phelph, R.N., Robert L. Tupper, M.D., will moderate the group.

MDPAC BREAKFAST
SEPT. 25, DETROIT
DURING ANNUAL SESSION

Wayne Professor Berman Dies

Lawrence Berman, M.D., professor of hematopathology at the Wayne State University School of Medicine, died of a heart attack on July 8. He was a co-founder of the American Society of Hematology and achieved wide recognition for research in cancer, leukemia, cell culture and biology. He was an associate editor of *Survey of Pathology in Medicine and Surgery*.

Doctor Berman received his M.D. degree from the University of Minnesota. He joined the medical faculty at Wayne State University in 1941 and served as chairman of the department of pathology from 1961 to 1964. He served as consultant to several Detroit area hospitals, including Detroit General, Detroit Memorial, Wayne County General, Oakwood, Sinai, St. Joseph Mercy in Pontiac, and the Veterans Administration Hospital in Allen Park.

OFFICE MANAGEMENT SEMINAR

MSMS will present an Office Management Seminar during the Annual Session for new physicians, residents, interns, and senior medical students from 3 to 5:30 p.m., Thursday, September 26 at the Sheraton-Cadillac.

A grant from Merck Sharp and Dohme makes this new feature possible.

INDEX MEDICUS AVAILABLE AT MSMS

Index Medicus, a monthly bibliography listing all articles contained in over 1300 world-wide medical publications, is now available at MSMS headquarters.

The MSMS collection dates from January 1968 to the present.

Physicians who need information from this handy publication of the National Library of Medicine should write or phone MSMS headquarters in East Lansing.

Seeks to Promote Medical Examiner System for State

To MSMS Members:

The Legal Affairs Committee of the Michigan State Medical Society has studied the possibility of a Medical Examiner System for Michigan for several years, and has supported several bills in the legislature which would extend and improve the existing county medical examiner system. (It is apparent that development of a central state-wide medical examiner system will require the support of the medical profession generally.) This is, therefore, a search for interested physicians. Any physician who is willing to give moral support now, or to consider active community service as medico-legal investigator in his own locale in support of a central state-wide system should correspond with

MEDEX, 120 W. Saginaw,
E. Lansing

An expression of opinion as to appropriate remuneration for participating physicians would be helpful.

R. C. Hendrix, MD
Chairman, Special Study Group
on Medical Examiner Laws

Medically Indigent In Homes Eligible For MD Services

R. Bernard Houston, Director, Michigan Department of Social Services recently announced that physicians' services may now be provided to group 2 (medically indigent) in the Title 19 (Medicaid) program who are receiving nursing home services in approved nursing homes, hospitals with chronic units rendering long-term care and county medical care facilities.

Physicians' services provided after July 1, 1968 will be covered to the extent of the first $50.00 or that portion of the first $50.00 not covered by Medicare (Title 18B) plus 20% of the remainder of the expense each calendar year. Physicians will bill the Michigan Medical Service for services on the same forms and in the same manner as for other services to eligible recipients.

There is no change in the physicians' services benefit for group 1 (categorical needy) recipients and patients are allowed freedom of choice of physician.

The Michigan Health Careers Mobile is making the county fair circuit to tell young people and their parents more about the many possibilities for careers in medicine and health. Among the active workers during the visit to the Vassar Fair were, left to right, Maurice H. Chapin, M.D., Millington, former county society president; Kathy Burns, student nurse; Mrs. Jack E. Goodwin, Auxiliary state chairman, Health Careers Committee; and Edward Elmendorf, M.D., current president of the Tuscola County Medical Society.

MSMS One Day Scientific Courses
September 25 & 26, Sheraton-Cadillac Hotel, Detroit

Enrollment Request:
Check course desired

Two courses to run simultaneously each day from 8:45 a.m. to 5:00 p.m.
Registration is limited to the first 45 persons enrolling in each course.
Course fee: $10 per course

Wednesday, September 25 (check one)

Course Content

Infectious Diseases

Chairman: A. Martin Lerner, MD

Recent advances in diagnosis, prevention, and therapy of bacterial and virus diseases will be discussed. Topics include respiratory virus, measles, and mumps vaccines; rubella; antiviral chemotherapy; interferon and new antibiotics with their special toxicities.

Pulmonary Diseases

Chairman: Geoffrey L. Brinkman, MD

The Pulmonary Course will cover management of respiratory failure, beginning with a discussion of the clinical manifestations and physiological abnormalities, and the best methods of care and rehabilitation. Speakers also will discuss pulmonary embolsis and advances in radiological techniques, medical therapy and surgical prevention and cure; and also acid-fast infections.

Blood Diseases

Chairman: Arnold R. Axelrod, MD

The postgraduate course in hematology is designed to orient the practicing physician to some of the common hematological problems manifested by changes in the peripheral blood cells. Our purpose is to develop an approach to the proper diagnosis and management of these entities.

Difficult Decisions in Digestive Diseases

Chairman: William S. Haubrich, MD

Practical problems encountered in gastroenterology, of concern to both the physician and the surgeon, will be explored by the case method. Each of six well-known MSMS members, active in the practice of gastroenterology, has selected and will present a case from their own files vividly illustrating particular problems in diagnosis and management. Doctors enrolled for the course will participate actively with invited guest experts in seeking answers to the questions raised. Controversy is expected, profitable discussion is assured.

An antibiotic should work well in either acid or alkaline urine.

It isn't always necessary to adjust urinary pH in treating G.U. infections.

Not when the causative organism is a strain sensitive to DECLOMYCIN® Demethylchlortetracycline, as is often the case.

DECLOMYCIN remains stable and active in either acid or alkaline urine. So there's no need to acidify the urine to keep the antibiotic at work.

Why match the urine to the antibiotic...when you can match the antibiotic to the urine...by prescribing DECLOMYCIN. A b.i.d. dosage makes therapy convenient for your patient.

Effectiveness: DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines in infections caused by organisms sensitive to the tetracyclines.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system – anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin – maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney – rise in BUN, apparently dose-related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions–urticaria, angioneurotic edema, anaphylaxis. Teeth – dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Capsules: 150 mg; Tablets: film coated – 300 mg, 150 mg and 75 mg of demethylchlortetracycline HCl.

STOP LEARNING

No, the medical profession can never stop learning. Recently the Coggeshall Report declared, "Rapid growth of knowledge and the introduction of new techniques make skills obsolete and comprehension inadequate long before the active professional life of the practitioner is finished. Thus, he can at no time be considered a finished product."

A recent editorial in JAMA discussed the continuing education efforts of state medical societies and declared that such programming, "demonstrates the leadership in maintaining professional competency can be assumed by the profession itself . . . and that is exactly where it belongs."

1968 MSMS Annual Session
September 25-26, 1968
Sheraton-Cadillac Hotel
Detroit

BY BRADLEY M. HARRIS, M.D.

MSMS PRESIDENT'S MESSAGE

Thank you . . .

With deep gratitude, I want to thank you for the opportunity to serve as President of this outstanding Michigan State Medical Society this past year.

Many of our major efforts this year will be continued effectively this coming year by MSMS under the excellent leadership of Jim Lightbody.

Considerable time and effort has been spent during 1967-1968 in the areas of continuing education, legislation, federal medical programs, medical manpower, and communications. In its more than 100 years of service to the public and the medical profession, MSMS has a fine record of performance in this complex field and many others. The House of Delegates, The Council, and our committees have acted wisely to establish realistic policies and to implement vital programs. New guidelines, I am sure, will be considered this month by the 1968 House of Delegates.

The State Society, the county medical societies, and every physician must become better informed about the many federal medical programs. These will continue to demand our attention so the medical profession can help them work effectively and economically to serve those who may need special medical services.

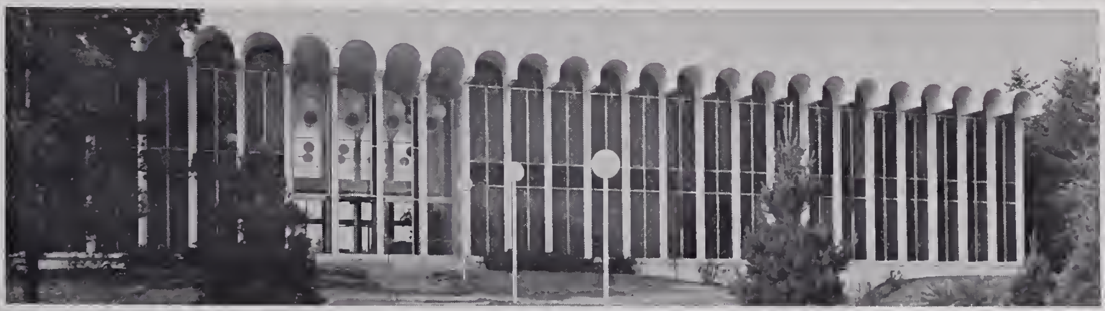
Medical legislation is closely related to the federal programming and I am pleased to see more and more county medical societies improving liaison with their state legislators and national congressmen. MDPAC has made tremendous strides forward this past year.

It seems hardly necessary to challenge each physician to become even more concerned about good communications, strong medical career recruitment efforts, and meaningful postgraduate educational projects. In all these fields, MSMS has strong committees providing solid direction — and staff members that are skilled, creative, and energetic. MSMS has a very good staff of dedicated men and women, and I offer my sincere thank you to each of them for guidance and encouragement given to me this past year.

MSMS has gained considerable stature during the past several years at the meetings of the AMA House of Delegates. Michigan delegates continue to offer timely resolutions, to serve effectively on various reference committees, and to debate the issues with statesmanship.

As a MSMS representative this year, I was well received at meetings of county medical societies, nearby state medical societies, the Upper Peninsula Medical association, AMA functions, and activities of many medical and health-related organizations.

I pledge my support to future MSMS leaders so together we can build an even more effective state medical society to serve the public and the medical profession.



MICHIGAN STATE MEDICAL SOCIETY, 120 W. SAGINAW, EAST LANSING, MICHIGAN 48823

Tandearil® in Osteoarthritis
oxyphenbutazone

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.
Warning: Tandearil is an analog of phenylbutazone; sensitive patients may be cross-reactive. If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy and in patients with thyroid disease.
Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia), sudden weight gain (water retention), skin reactions, black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.
Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension, the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reacti-

Pain Break” for an osteoarthritic.

Tandearil can usually ease it.

At 46, her knees still look good on the outside. But inside, there may be the familiar picture of osteoarthritis.

If aspirin doesn't help, Tandearil often will. Pain and stiffness begin to ease up in 3 or 4 days. You can often maintain response with a daily dose of only 1 or 2 tablets.

Of course, Tandearil is not for every osteoarthritic. Select your patients carefully and follow them in line with the Contraindications, Precautions, Warning, and Adverse Reactions listed below.

But for many aspirin-stubborn osteoarthritics, let Tandearil ease the unwelcome pain breaks of osteoarthritis.

Tandearil®
oxyphenbutazone

ıte a latent peptic ulcer. The patient should
e instructed to take doses immediately after
eals or with milk to minimize gastric upset.
rug rash occasionally occurs. If it does,
omptly discontinue the drug. Agranulocy-
sis, exfoliative dermatitis, Stevens-Johnson
ndrome, Lyell's syndrome (toxic necrotiz-
g epidermolysis) or a generalized allergic
action similar to a serum sickness syn-
ome may occur and require permanent
ithdrawal of medication. Agranulocytosis
an occur suddenly in spite of regular, re-
eated normal white counts. Stomatitis, sali-
ary gland enlargement, vomiting, vertigo and
nguor may occur. Leukemia and leukemoid
actions have been reported. While not defi-
tely attributable to the drug, a causal rela-
onship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity, angiitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

For complete details, please see full Prescribing Information.

Geigy

Dosage in Osteoarthritis: Initial: 3 to 6 tablets daily in divided doses. Usually unnecessary to exceed 4 tablets daily. A trial period of one week is considered adequate to determine the therapeutic effect of the drug. Maintenance: Effective level often achieved with 1 or 2 tablets daily, should not exceed 4 tablets daily. In selecting appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and other factors influencing drug response.
Availability: Tan, round, sugar-coated tablets of 100 mg. in bottles of 100 and 1000.

Let's be specific about Campbell's Soups...

and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

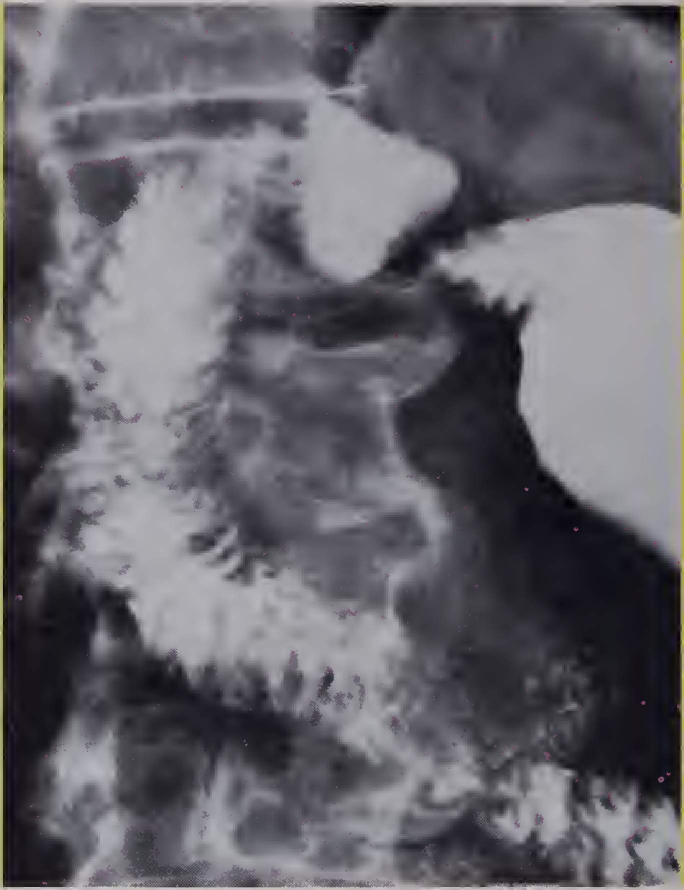
THE RESTLESS DUODENUM...



DUODENUM–(Conventional X-ray) The restless duodenum makes radiographic diagnosis difficult, uncertain and often unproductive. Is this duodenum normal?

Pro-Banthīne®

brand of
propantheline bromide

For fifteen years Pro-Banthīne has been the most widely used anticholinergic agent in disorders of gastrointestinal motility and gastric hypersecretion. More recently Pro-Banthīne has reestablished its pharmacologic effectiveness in facilitating diagnostic procedures using intragastric fibroscopy and hypotonic roentgenography.

How the X-rays were taken

In the hypotonic duodenograph[1,2] reproduced above, the gastrointestinal tract was relaxed with Pro-Banthīne. The duodenum was intubated. Pro-Banthīne in a dose of 60 mg. intramuscularly was used to assure prompt aperistalsis, and double-contrast visualization was achieved with ordinary barium and air.

The same pharmacologic efficiency has proved of pronounced value in such conditions as: *peptic ulcer, pylorospasm, biliary dyskinesia, functional hypermotility and irritable colon.*

...AT REST

SAME DUODENUM—(Hypotonic X-ray) Pro-Banthīne-induced duodenal calm permits full anatomic appraisal in the same patient. Duodenal normality is now evident.

calms the gastrointestinal tract

Contraindications: Glaucoma; severe cardiac disease.

Precautions: Since varying degrees of urinary hesitancy may occur in elderly males with prostatic hypertrophy, this should be watched for in such patients until they have gained some experience with the drug. Although never reported, theoretically a curare-like action may occur with possible loss of voluntary muscle control. Such patients should receive prompt and continuing artificial respiration until the drug effect has been exhausted.

Side Effects: The more common side effects, in order of incidence, are xerostomia, mydriasis, hesitancy of urination and gastric fullness.

Dosage: The maximal tolerated dosage is usually the most effective. For most *adult* patients this will be four to six 15-mg. tablets daily in divided doses. In severe conditions as many as two tablets four to six times daily may be required. Pro-Banthīne (brand of propantheline bromide) is supplied as tablets of 15 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg. The parenteral dose should be adjusted to the patient's requirement and may be up to 30 mg. or more every six hours, intramuscularly or intravenously.

NEW MEMBERS

Members of the Michigan State Medical Society join in welcoming the following new members into a progressive state medical organization. MSMS is dedicated to promote the science and art of medicine, the protection of the public health, and the betterment of the medical profession. Each new member is encouraged to join with other MSMS members at both the local and the state levels in achieving these goals.

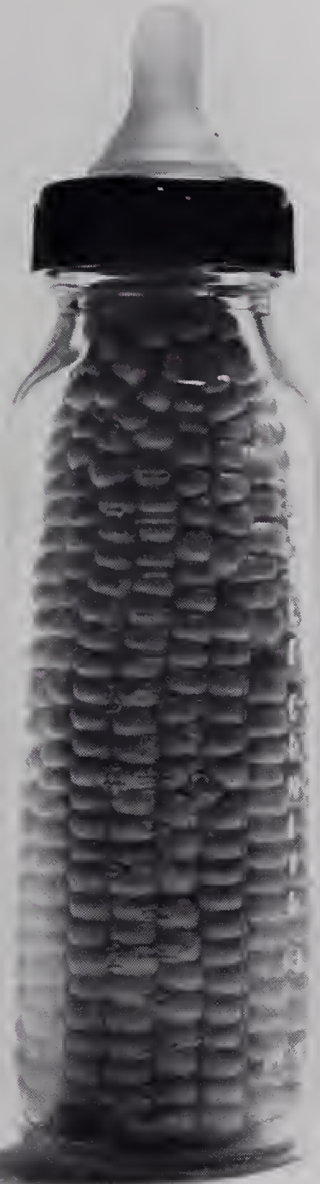
HOW CORNY SHOULD A FORMULA BE?



Just enough to eliminate unnecessary ingredients and provide excellent nutritive value. Both corn oil and corn syrup solids are used in Modilac,™ Gerber Baby Formula to provide essential nutrients with allergenic potential from only a single additional protein source. Corn oil replaces butter fats, supplying generous levels of the essential linoleic acid. Corn syrup solids provide dextrose, maltose and dextrins for spaced carbohydrate absorption. All of these components come from the single ingredient—corn, thus minimizing the possibility of allergy arising from a variety of ingredients.

Concentrated
MODILAC
LIQUID INFANT FORMULA
WITH IRON
Gerber

Why is corn oil used? Because it is high in linoleic acid which presumably lowers serum cholesterol, provides for greater caloric efficiency[1] and is necessary for maintaining skin integrity.[2]

Why is corn sugar used? Because years of use in baby formulas has proven corn sugar to be well tolerated and effective in modifying cow's milk for infant use.

Why is Gerber Modilac, with its corn derived ingredients, a formula of choice? Because clinical tests[3,4] have shown it to have a high caloric and protein efficiency. Babies using it show excellent growth rate, low serum cholesterol, normal stooling and a low incidence of diaper rash or skin irritation.[3]

VIEWPOINTS

House Reference Hearings Are Open

BY JAMES B. BLODGETT, M.D.
MSMS SPEAKER

The September meeting of the MSMS House of Delegates is the first regular meeting at which I shall preside as your newly-elected Speaker. I am grateful for this honor and mindful of the responsibility that this privilege implies.

The Annual Meeting of the elected Delegates is the means by which MSMS policy is determined and implemented. Each seated Delegate represents 50 physicians from his district.

IT IS THE BUSINESS of the House to consider committee actions and recommendations from the previous year and act upon resolutions which are presented to it by its members. These matters are first referred to Delegates Reference Committees composed of a number of Delegates. At the hearing of these committees the questions are studied in depth by consideration of pertinent data and by discussion with interested Delegates and members.

> *The reference committee meetings are held at a time when the House is not meeting and are open to any interested persons. The recommendations of the Reference Committees are then reported to the House where they are further discussed and considered by the full membership. Only then is action taken which may approve, disapprove or study further the questions at hand.*

In addition to these deliberations, the House directs policy through its various elections. The House elects Delegates to the National House of Delegates of the AMA; members of The MSMS Council who provide the continued direction of MSMS between sessions of the House; physician representatives on the Board of Blue Shield; members of the Judicial Commission; and finally the officers of the State Society including the Speaker.

IT IS IN THIS manner that your Delegates exercise a direction of the Society in making policy and its implementation. As Speaker, it is my duty to see that this democratic process is fairly and efficiently carried out to implement the rule of the majority and to protect the rights of the minority and the individual Delegate.

I am aware, as you are, that ideas arise from individuals, they are tested by discussion and reference to the facts and then they are implemented by the judgement of the majority.

> *In the interest of efficiency and equity we will request that resolutions be submitted early enough before the meeting of the House that they can be in the hands of the Delegates at the time of the meeting. We will recommend that no new resolutions be introduced after the second session so that adequate consideration can be afforded them by the reference committees.*

DURING THE FINAL session of the House the delegates selected by all of the county medical societies will elect the officers and councilors who will make a significant contribution of their time, and effort, in conducting the affairs of the Society. The offices to be filled by these elections are of great importance and it will be your Delegates' responsibility to select men you want and trust, and men who will properly represent you. Each election should and will receive the most careful consideration.

All members of MSMS are cordially invited to observe the deliberations of the House and to take part in the meetings of the reference committees. ☐

MSMS Annual Session Helps Assure Competency

BY JOHN W. MOSES, M.D.
SCIENTIFIC EDITOR

Graduate – "One who has received a degree or diploma on completing a course of study" (The American College Dictionary).

It is unfortunate that the dictionary utilizes the word completing. Graduation from medical school should be looked upon as the start of one's course of study rather than the completion.

Most graduates of medical school today will embark upon as many years of formalized training as they spent in medical school . . . and they will still not be a graduate by the above definition.

It is impossible (if one is to be a competent physician) to ever complete the course of study

in medical education—as it is a continual ongoing process.

The changes in technology, methodology, and pharmacology make the Buck Rogers' stories of our youth pale by comparison. Medical societies, hospitals, professional groups and medical schools have embarked upon massive programs in continuing medical education to keep physicians well informed and up-dated.

The MSMS Annual Scientific Session at the Sheraton-Cadillac Hotel in Detroit, September 25-26, is but one effort by your Society in continuing medical education. Four post-graduate day-long courses will be held by eminent authorities embracing "Infectious Diseases," "Pulmonary Diseases," "Blood Diseases" and "Difficult Decision in Digestive Diseases." These are in addition to scientific exhibits, general sessions and specialty group discussions.

It is hoped that the members of MSMS will find the scientific session of the annual meeting rewarding and informative.

Medicare No Panacea

BY BROOKER L. MASTERS, M.D.
MSMS COUNCILOR

How has the public reacted to Medicare and proposals to expand it for those under 65?

There have been several surveys conducted by reputable organizations in recent months.

Many of our patients are referring now to a survey conducted by *Better Homes and Gardens* magazine. The study was conducted in cooperation with Opinion Research Corporation of Princeton. A total of 278,477 completed questionnaires, printed in the October and November, 1967, issues.

Better Homes and Gardens reports now that:

"Medicare evidently is not a panacea in the minds of the respondents. A strong 8 in 10 indicate an unwillingness to finance Medicare for those under 65 through additional Social Security taxes. In fact, 18 percent feel that Medicare should be done away with entirely (13 percent of the respondents feel that Medicare should be available to all.)"

There were other questions about medicine in the questionnaire. Let me quote the magazine again.

"Two-thirds of the respondents feel doctors' fees are high but justified by greater training and skill, in line with other professionals, and are quite fair."

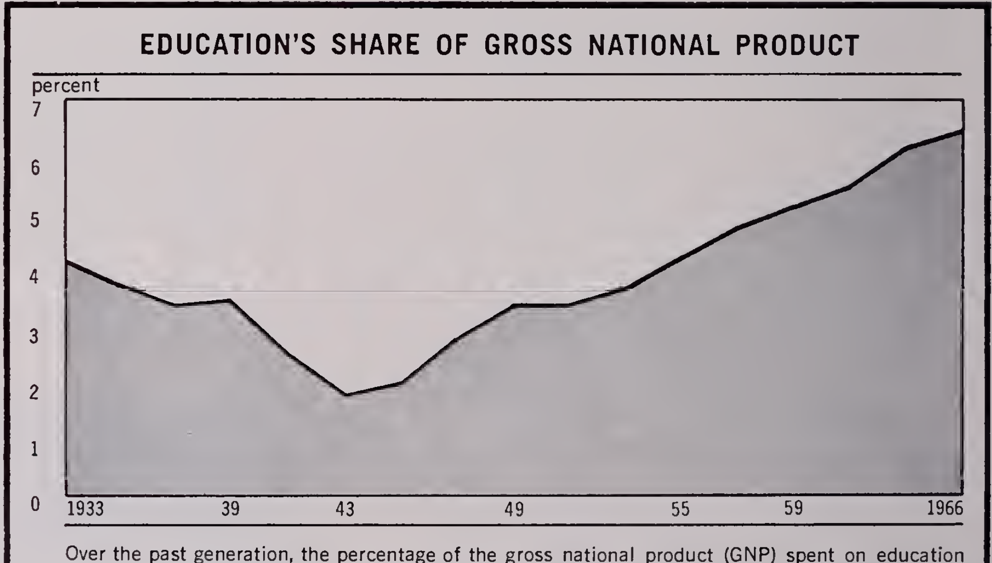
For years many physicians have argued that Medicare was unwise and costly. Despite these views, the physicians have cooperated to make Medicare work as effectively as possible.

The *Better Homes and Gardens* magazine reveals to all of us that quite a few citizens, too, see the law as unwise and costly in many regards. ☐

Thought Starter

The pattern of providing all or most of the training and education of medical students at a medical college would be like educating a forestry major at only a lumber yard.

—John G. Freymann, M.D.
Boston



Over the past generation, the percentage of the gross national product (GNP) spent on education has varied considerably—from a low of 1.8 to a high of 6.6 percent—but the trend has been steadily upward since 1943. The 1965-66 school year (the latest comparable period) ranked high both in terms of total school expenditures and share in the GNP.

Speaking of Malpractice Insurance....

Have you checked the advantages of insuring with Shelby Mutual Insurance Company? This plan is sponsored by Michigan Association of the Professions and is available to members of the Michigan State Medical Society.

Here is why it might be beneficial for you to investigate

* Very Broad Coverage

* Competitive Premiums as Shown Below

Limits	Class 1	Class 2	Class 3	Class 4	Class 5	Premises Minimum Premium
100/300,000	$97.00	$170.00	$292.00	$389.00	$486.00	$33.00

(Premises Coverage Required with Professional Liability)

Class 1 —	PHYSICIANS — No surgery.
Class 2 —	PHYSICIANS — Minor surgery or assisting in major surgery on own patients.
Class 3 —	SURGEONS — General practitioners who perform major surgery or assist in major surgery on other than own patients.
Class 4 —	SURGEONS — Specialists.
Class 5 —	SURGEONS — Specialists — Anesthesiologists, Neurosurgeons, Obstetricians-Gynecologists, Orthopedists, Otolaryngologists.

Car Flips—Driver Breaks Leg

STAFF PHOTO

s, Sept. 7. John P. Jones of
incurred a broken leg today

Patrolman B. R. Brown, the car hit a
fire hydrant and flipped over on its

He's had enough excitement for one day.

For the patient who has been through an accident, the worry and anxiety following the experience may actually heighten the perception of pain. This is why there's a classic 1/4 grain *sedative* dose of phenobarbital in Phenaphen with Codeine—*to take the nervous "edge" off,* so the rest of the formula can control the pain more effectively.

Phenaphen® with Codeine

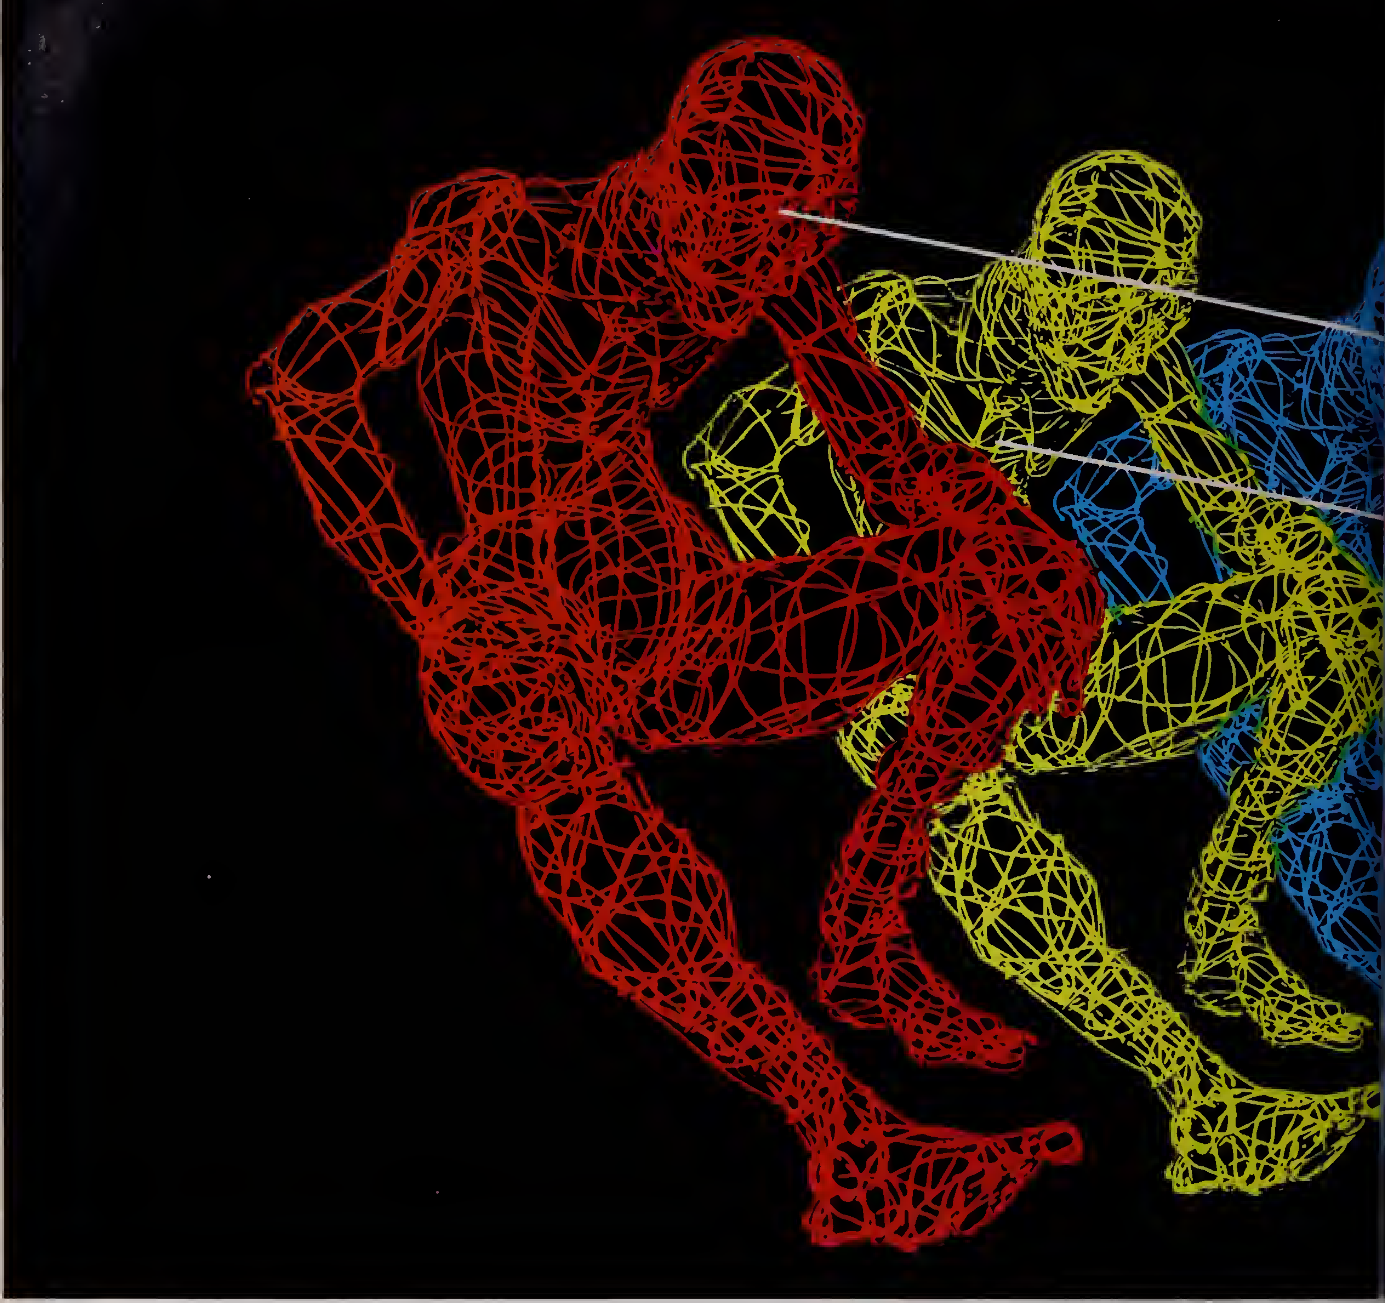
Phenaphen® with Codeine No. 2, No. 3, or No. 4 contains: *Phenobarbital* (1/4 gr.), 16.2 mg. (Warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine Phosphate, 1/4 gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4). (Warning: may be habit forming).

THE COMPOUND ANALGESIC THAT CALMS INSTEAD OF CAFFEINATES

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** 1 or 2 capsules at 2 to 4 hour intervals, or as directed by physician. For further details see product literature.

A. H. ROBINS COMPANY
RICHMOND, VA. 23220 A-H-ROBINS

a comprehensive hematinic



Description: Each Pulvule® contains—

Special Liver-Stomach Concentrate, Lilly (containing Intrinsic Factor)	150 mg.
Cobalamin Concentrate, N.F., equivalent to Cobalamin	7.5 mcg.
(The total vitamin B_{12} activity in the Special Liver-Stomach Concentrate, Lilly, and the Cobalamin Concentrate, N.F., is 15 micrograms.)	
Iron, Elemental (as Ferrous Fumarate)	110 mg.
Ascorbic Acid (Vitamin C)	75 mg.
Folic Acid	1 mg.

Indications: Trinsicon® (hematinic concentrate with intrinsic factor, Lilly) is a multifactor preparation effective in the treatment of anemias that respond to oral hematinics, including pernicious anemia and other megaloblastic anemias and also iron-deficiency anemia.

Contraindications: Hemochromatosis and hemosiderosis.

Precautions: Anemia is a manifestation that requires appropr
investigation to determine its cause or causes.
In pernicious anemia, the use of folic acid without adequ
vitamin B_{12} therapy may result in hematologic remission but n
rological progression. Adequate doses of vitamin B_{12} (parente
or oral with potent intrinsic factor as in Trinsicon® [hemat
concentrate with intrinsic factor, Lilly]) usually prevent, halt,
improve the neurological changes.
As with all preparations containing intrinsic factor, resista
may develop in some cases of pernicious anemia to the poter
tion of absorption of physiological doses of vitamin B_{12}. If res
ance occurs, parenteral therapy, or oral therapy with so-ca
massive doses of vitamin B_{12}, may be necessary. No single r
men fits all cases, and the status of the patient observed
follow-up is the final criterion for adequacy of therapy. Peric

You can treat combined deficiencies with

Trinsicon®

—the multifactor hematinic

Vitamin B_{12} plus intrinsic factor (15 mcg. B_{12} activity)—helps provide adequate levels of this important vitamin.

Folic acid (1 mg.)—treats nutritional macrocytic anemias and/or malabsorption syndromes.

Ascorbic acid (75 mg.)—augments the conversion of folic acid to its active form and helps iron absorption.

Iron (110 mg.)—treats hypochromic anemia.

linical and laboratory studies are considered essential and are ecommended.

dverse Reactions: In rare instances, iron in therapeutic doses roduces gastro-intestinal reactions, such as diarrhea or constiation. Reducing the dose and administering it with meals will inimize these effects.

In extremely rare instances, skin rash suggesting allergy has ollowed oral administration of liver-stomach material. Instances f apparent allergic sensitization have also been reported after ral administration of folic acid.

osage: One Pulvule twice a day. (Two Pulvules daily produce a tandard response in the average uncomplicated case of perniious anemia.)

ow Supplied: Pulvules Trinsicon® (hematinic concentrate with ntrinsic factor, Lilly), in bottles of 60 and 500. [032568]

In peptic ulcer:

the antacid puzzle

solved by Mylanta®

aluminum and magnesium hydroxides *plus* simethicone

"will it ease the pain?"

Mylanta helps relieve ulcer pain with the two most widely prescribed antacids: aluminum and magnesium hydroxides.

will it help "my gassy stomach"?

Mylanta *also* contains simethicone: for concomitant relief of G.I. gas distress.

"will this one taste O.K.?"

The *prolonged* acceptance of Mylanta was recently confirmed in 87.5% of 104 patients—after a total of 20,459 documented days of therapy.* *Danhof, I. E.: Report on file.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. *Dosage:* One or two tablets (well chewed or allowed to dissolve in the mouth) or one or two teaspoonfuls to be taken between meals and at bedtime.

ACHROMYCIN® WORKS HERE

TETRACYCLINE

American Map Co., Inc., New York, No NY 388

See inside fold for product summary.

ACHROMYCIN® WORKS HERE
TETRACYCLINE

Actually ACHROMYCIN works wherever the infection is due to an organism your lab cultures have shown to be tetracycline-sensitive. No other tetracycline–or analogue–can assure you of quicker or more effective antibiotic action. After all, isn't that what you want for your patient?

ACHROMYCIN was a pioneer in tetracycline therapy. Seventeen years of experience have shown that when the respiratory system, the genitourinary system, or the skin and soft tissue require treatment for infection probably caused by any of a number of sensitive strains, ACHROMYCIN is a wise choice for therapy while awaiting test results.

Available in 31 useful forms to meet your situational needs.

Effectiveness: ACHROMYCIN Tetracycline is a crystalline broad-spectrum antibiotic which provides effective therapeutic activity against susceptible microorganisms.

Contraindication: History of hypersensitivity to tetracycline.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. Some patients may develop a photodynamic reaction to natural or artificial sunlight. Those with a history of photosensitivity reactions should avoid direct exposure to sunlight while under treatment. Discontinue drug at first evidence of skin discomfort.

Precautions: Use may result in overgrowth of nonsusceptible organisms. Constant observation is essential. If new infections appear, take appropriate measures. Use of tetracycline during teeth development may cause discoloration of teeth.

Side Effects: Gastrointestinal system —anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes (a case of exfoliative dermatitis has been reported); photosensitivity reaction, onycholysis and discoloration of nails (rare). Kidney—rise in BUN, apparently dose-related. Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. In young infants, bulging fontanels have been reported following full therapeutic dosage. This symptom has disappeared rapidly when drug is discontinued. Teeth—dental staining (yellow-brown) in children of mothers given tetracycline during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. Blood—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. Liver—cholestasis (rare), usually at high dosage. Tetracycline may form a stable calcium complex in bone-forming tissue. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: One Gm. per day, in 4 divided doses of 250 mg. each. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

BOOK REVIEWS

HEREDITY, DISEASE AND MAN: GENETICS IN MEDICINE. By Alan E. H. Emery. $6.95 247 pp., illustrated. University of California Press, Berkeley and Los Angeles, 1968.

This book presents a very excellent review of our present knowledge of genetics as it relates to man. The author, Doctor Emery, is Chairman of the Department of Human Genetics at the University of Edinburgh. The text is very well written with clear explanations and good illustrations of the more complicated aspects of cytogenetics. Since this was not intended to be a textbook for students in medicine, some parts of the material are somewhat superficial. An example of this is the description of DNA and the chemistry of genes in which many of the details are omitted. To compensate for this are the frequent references to historical development of various aspects of genetics that often are not included in the more rigid frame of a textbook.

The material covered is quite comprehensive beginning with the chemical basis of inheritance and the description of DNA and RNA. The chromosomes and chromosomal abnormalities are discussed and illustrated. It is unfortunate that photographs were not used instead of line drawings to illustrate some of the abnormalities that are described throughout the text. The line drawings simply do not adequately portray the characteristic findings for the reader who is unfamiliar with them. Methods of inheritance such as dominant, recessive and sex-linked aspects are very adequately described. An unusual and very excellent chapter is that on pharmacogenetics. The material presented here is often omitted from other books on the subject. It seems to this reviewer that this chapter conveys as well or better than most others the intricacies of the influence of genetics on our lives other than the purely structural ones. Population and natural selections are discussed as well as the effects of radiation of human hereditary. A ten page glossary adds considerable value to the book and makes it easier for the reader to look up unfamiliar words rather than referring back to the chapter in which these words first appeared.

Any physician who is interested in genetics would benefit by reading this text. If he has kept up with developments by reading the review articles as they appear in our medical journals, he probably will find the presentation by Doctor Emery to be too superficial to be of great value to him. If, on the other hand, the physician wants a good review that is not too complicated, this book would adequately fill that need. The text is purely descriptive and no techniques or details of methods are given. Most chapters are followed by a very adequate though brief list of references. With the exception of lack of photographs, the illustrations are excellent and supplement the text very well.

George H. Lowrey, M.D.

SEES STATE MEDICAL JOURNAL ROLE INCREASING

The state medical society journals, I firmly believe, will be of even greater value in the future. The state medical society journals in coming years will provide more essential information to physicians in such areas of growing importance as socioeconomics and legislation.

—GEORGE F. LULL, M.D.
—EXECUTIVE SECRETARY
ILLINOIS MEDICAL SOCIETY

To fight TB-find it first!

Make tuberculin testing routine with every physical examination.

TUBERCULIN, TINE TEST
(Rosenthal)

Side effects are possible but rare: vesiculation, ulceration, or necrosis at test site. Contraindications: none, but use with caution in active tuberculosis. Available in 5's and 25's.

Finally...a salicylate superior to aspirin?

Not at all, Doctor...but

magan

(magnesium salicylate, W-T)

should be considered for your arthritic
and rheumatic patients who cannot tolerate aspirin.

Surveys * made in 1966 and 1967 among private practice physicians showed an incidence of intolerance to aspirin ranging from 3-85%. The majority of physicians surveyed reported an intolerance in 10-30% of their patients.

How does this compare with your experience?

WARREN-TEED PHARMACEUTICALS INCORPORATED
COLUMBUS, OHIO 43215
SUBSIDIARY OF **ROHM AND HAAS COMPANY**

10-30

*by two independent national research organizations

Don't use Magan on all your patients–

consider Magan for those patients who cannot take aspirin because of gastric discomfort

Private Practice Physicians tried Magan on almost 700 patients whom they judged intolerant to aspirin and other salicylates.

The majority of these patients could take Magan and obtain the benefit of salicylate therapy.

magan **an alternate salicylate**

(magnesium salicylate, W-T)

May be tolerated by some persons intolerant to aspirin by reason of gastrointestinal irritation.

Magan is a new salicylate product from Warren-Teed.

A single chemical entity . . . no coating, no buffering, sodium free and non-acetylated.

Composition: Each orange colored tablet contains 5 grains (approx. 325 mg) of magnesium salicylate.

Dosage: 1 or 2 tablets every 4 hours with a full glass of water.

An anorectic will help her lose weight–
but can she keep it off?
You need more than a pill
(even ours) to do that!

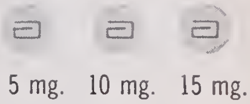
That's why Abbott offers you a pill plus a program.

The Product

For smooth appetite control plus mood elevation

DESOXYN® Gradumet®

Methamphetamine Hydrochloride
in Long-Release Dose Form



For patients who can't take plain amphetamine

DESBUTAL® 10 Gradumet

10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet

15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

The Program

Weight Control Booklet

Specifically written to help your patients understand why they are overweight, and what they can do about it. The booklet stresses the importance of *changing lifelong eating habits* and explains how this can be done, sensibly, comfortably—and permanently. There is, also, a comprehensive list of foods showing their caloric content.

the secret of controlling your weight

Food Diary

Designed to help the overweight patient follow your eating instructions. Space is provided for breakfast, lunch, supper, and even snacks. By writing down everything that's eaten each day, the patient is constantly reminded that she's trying to change her eating habits. And you are furnished with a written record of how well she's doing.

Picture Menu Booklet

A large (10″ x 10″) booklet which features appetizing lunch and dinner menus for every day of the week. The meals are depicted in full color and the correct portion size so that the dieter can see the amount of food that's recommended. Patients are pleasantly surprised to learn that each day's meals add up to only 1,000 calories. 801444

To help you control your weight...

Please see Brief Summary on next page.

Ask Your Abbott Man For Free Supplies

Brief Summary

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

Indications: Desoxyn and Desbutal are used orally as appetite suppressants, for reduction of mild mental depression, and to help in management of psychosomatic complaints or neuroses. Desoxyn, when administered parenterally, may be used as a vasopressor agent or analeptic.

Contraindications: Methamphetamine (in Desoxyn and Desbutal) is contraindicated in patients taking a monoamine oxidase inhibitor. Do not use pentobarbital (in Desbutal) in persons hypersensitive to barbiturates.

Precautions, Side Effects: Observe caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs. Prolonged usage may lead to tolerance or psychic dependence. Careful supervision is necessary to avoid chronic intoxication and drug dependence.

Amphetamine side effects such as headache, excitement, agitation, palpitation or cardiac arrhythmia usually may be controlled by reducing the dose. Paradoxically-induced depression is an indication to withdraw the drug. Pentobarbital (in Desbutal) may cause skin rash. Nervousness or excessive sedation with Desbutal is often transient.

ABBOTT

When eating fads of teens or tots Lead to a sudden case of "trots"

Parepectolin for quick relief of acute diarrhea
...soothes colicky pain with paregoric*
...consolidates fluid stools with pectin
...adsorbs irritants with kaolin,
and protects intestinal mucosa

In children, Parepectolin may be used to control diarrhea promptly and prevent dehydration, until etiology has been determined. In some cases, Parepectolin may be all the therapy necessary.

Parepectolin®

Each fluid ounce of creamy white suspension contains:
*Paregoric (equivalent) .... (1.0 dram) 3.7 ml.
Contains opium (¼ grain) 15 mg. per fluid ounce.
warning: may be habit forming
Pectin .... (2½ grains) 162 mg.
Kaolin (specially purified) .... (85 grains) 5.5 Gm.
(alcohol 0.69%)
Usual Children's Dose: One or two teaspoonfuls three times daily.

RORER
WILLIAM H. RORER, INC.
Fort Washington, Pa.

Review of "Prevention of Highway Injury," edited by Melvin L. Selzer, M.D., Paul W. Gikas, M.D., and Donald F. Huelke, Ph.D. and published by the University of Michigan, Ann Arbor, Michigan.

This is a book of thirty chapters individually written by authors from the United States, Canada and Europe, and divided into four general headings of The Alcoholic Driver, Vision and Medical Impairment, Biomechanics, and The Second Collision. The material in the first two general headings is of greater practical value to the physician interested in traffic safety. I would recommend especially the two articles written by Julian A. Waller, M.D., of the California Department of Public Health: Drinking Drivers and Driving Drinkers — The Need for Multiple Approaches to Accidents Involving Alcohol; and The Contribution of Medical Impairment to Traffic Accidents.

In the first chapter, Doctor Waller emphasizes the now accepted fact that the majority of drinking accidents and violations involve persons with alcoholism, and that the current practice of emphasizing moral responsibility with slogans such as, "If you drive, don't drink," and with heavy fines and suspension of licenses for drunken driving will have little or no beneficial effect. For many persons with alcoholism the driver's license will have to be revoked until the alcoholism improves under treatment. He suggests that many social drinkers do drink and drive despite admonition, and that we can teach them how to limit their risk by eating with their drinks, by not drinking more rapidly than they can metabolize their alcohol (about one hour for each drink), and by waiting at least a half hour after their last drink before driving.

In the chapter on Medical Impairment, Doctor Waller makes several interesting observations based on available studies from a number of sources. Acute medical conditions are not felt to be an important cause of accidents. However, more subtle physiologic changes related to aging and chronic conditions appear to be a contributory factor in a substantial proportion of accidents. Medical impairment from chronic conditions other than alcoholism in a factor in 15-25 percent of all accidents. However, licenses should be revoked only for persons with the most severe illness, representing, at most, a third of the medical groups and five percent of all drivers. This is the group with accident risk in excess of 3-4 times that of the general population.

This book has two minor deficiencies. The type is considerably smaller than that used in current medical texts and magazines. An additional 75 pages would have produced a more easily read book. Also, only two chapter authors out of thirty had summaries at the beginning of their chapters.

Bellaire, Michigan

State Researchers Work On Adenine Project

Research scientists at the Michigan Department of Public Health are taking part in an investigation to determine if a new additive, may be suitable for prolonging the useful life of donated blood. The Michigan study is primarily concerned with the effect of adenine on the various blood products that are made from whole blood.

The study is financed by a contract of $65,765 from the U.S. Public Health Service's National Heart Institute.

Previous studies by army researchers and other scientists have established that adenine can extend the useful life of blood. There is evidence that blood containing this additive can be stored safely for up to 42 days instead of the normal maximum of 21 days. If this proves to be true, better utilization of whole blood can be achieved and thus help meet the increasing military and civilian needs.

The method of investigation will follow established laboratory procedures for comparative studies.

No injection after all!

This penicillin produces high, fast levels—orally.

Pen•Vee® K is usually so rapidly and completely absorbed that therapeutic penicillin levels are attained within 15 to 30 minutes. Thus it can often obviate the need for penicillin injections. The higher serum levels produced generally last longer than with those of oral penicillin G.

Indications: Infections susceptible to oral penicillin G: prophylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.
Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.
Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.
Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.
Adverse Reactions: (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").
Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

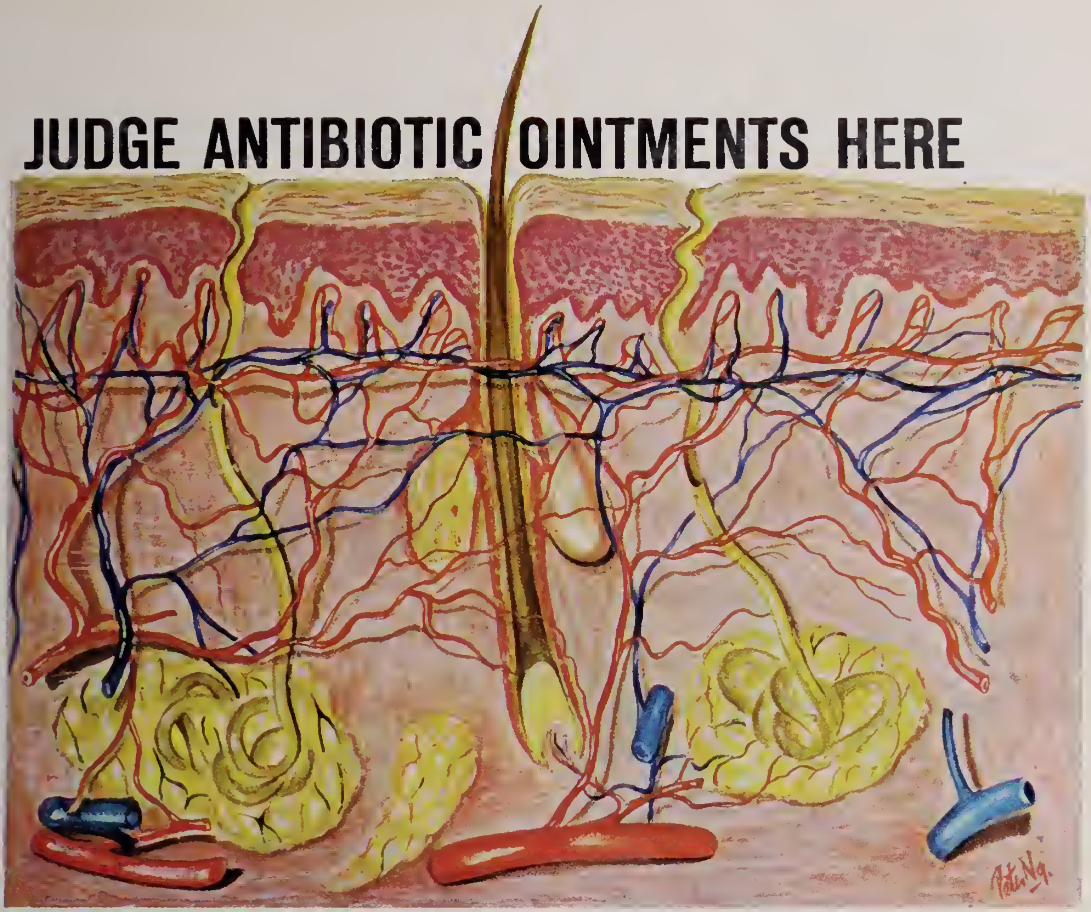
ORAL PEN•VEE® K

(potassium phenoxymethyl penicillin) Wyeth

JUDGE ANTIBIOTIC OINTMENTS HERE



Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B —bacitracin—neomycin) Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and nonirritating.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.

Complete literature available on request from Professional Services Dept. PML.

'NEOSPORIN'®

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N.Y.

Muscle in Spasm

and Valium (diazepam)

The ability of Valium to help relieve skeletal muscle spasm—as well as psychic tension—demonstrates its clinical value and versatility.

The muscle-relaxant effect obtained with Valium, used adjunctively with other drugs or physiotherapy, favorably affects the entire cluster of spasm-related symptoms . . . helps accelerate return to normal activity.

When skeletal muscle spasm and psychic tension coexist, the calming effect of Valium is an added therapeutic benefit that contributes to the total management of the patient.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Valium® (diazepam)
2-mg, 5-mg, 10-mg tablets

Louie!
You're
back.

Louie lost weeks with
a painful shoulder. That's a lot of fish.
It might have been different with **Butazolidin® alk**

100 mg.	phenylbutazone
100 mg.	dried aluminum hydroxide gel
150 mg.	magnesium trisilicate
1.25 mg.	homatropine methylbromide

If it doesn't work in a week, forget

But please don't forget this:

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of the alka formulation are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Agranulocytosis can occur suddenly in spite of regular, repeated normal white counts. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angiitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Painful Shoulder: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily.

In selecting the appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response. (B)R 46-070-A

Power Mower Injuries Of the Hand

J. JOSEPH DANYO, M.D.
YORK, PA.
KIM K. LIE, M.D.
ROBERT D. LARSEN, M.D.
JOSEPH L. POSCH, M.D.
DETROIT

INTRODUCTION

During the past 25 years the power lawn mower industry has achieved a substantial volume of sales. The industry came of age with the advent of the rotary unit, which was developed as a means of coping with the steel shortage during World War II. Mowers prior to that time were of the reel type.

The power mower market in the United States is reliably reported as consisting of 25 million units. Upwards of five million new mowers are sold yearly, and of these, one million units are purchased by new owners.[1]

These convenient labor-saving machines are a boon to the welfare of our landscape and leisure time, but if handled incorrectly, they can become a menace to our families and neighbors. The industry has waged an excellent campaign of power mower safety for the past 12 years. And manufacturers are designing their machines to lessen the possibility of accidents occurring from missiles and direct contact with moving parts. Yet, the number of accidents continue to rise in astronomical proportions. Most mishaps nowadays, are due to the operator's carelessness.

There is no accurate estimate of the number of power mower injuries occurring in the United States. McClure[2] reported a series of 794 injuries in a survey in Georgia in 1955 and 1956. Of these injuries, 553 were caused by direct contact, and 143 cases involved injuries to the hand or fingers. Permanent disability occurred in 14 per cent of the cases. Two types of injuries were noted: one type due to direct contact, which occurred in 70 per cent of the cases; and another type due to missiles thrown by the power mower in 30 per cent of the cases. McClure[3] mentioned three reasons for the occurrance of accidents.

1. Faulty design of the mower.
2. Carelessness of the operator.
3. Injuries by missiles which are thrown by the power mower or fragments of mower blades.

Bergman[1] reported on a series of 110 power mower injuries during a five-month period. The severity of the injuries was apparent because 30 per cent of cases required hospitalization.

CASES

Our study deals with 110 power mower injuries of the hand encountered in private practice from 1954 to 1967 inclusive. The age of the patients ranged from 2 to 83 years. The average age of the patient was 32 years. The majority (85 per cent) of the patients were male. Children under 14 years of age were involved in 23 cases. Permanent disability in children occurred in 30 per cent of the cases. Of note was the fact that virtually all of the injuries to children occurred while the power mower was unattended and the motor was running.

Eighty-five per cent of the cases were severe injuries requiring hospitalization for surgical repair. The right hand was involved in 55 per cent of the cases and the left hand in 45 per cent. Single digit injuries occurred in one-third of the cases. The remaining two-thirds of the cases involved two to four digit injuries, and in four cases all digits on the hand were injured. In addition to soft tissue injury, 80 per cent of the cases had an injury to the bony structure. Thirty per cent of the injuries resulted in amputation of the digit. Permanent disability occurred in 23 per cent of the adults. The average loss of time from work in the adults was six weeks.

ETIOLOGY

In our series, our patients readily admitted to being at fault. The rotary mower was involved in 91 per cent of the cases, and the reel type mower in 9 per cent of the cases. By definition, the rotary mower is one that has a horizontal blade (s) that rotates about a vertical axis, cutting by velocity alone, without a stationary bed-knife. Rotary cutter blade speed is 21,000 feet-per-minute.[5] These

---

Doctor Danyo, a fellow in hand surgery and formerly at Grace Hospital, Detroit, is now in York, Pa. Doctors Lie, Larsen and Posch are all with the Department of Surgery at Grace.

figures compared exactly to the ratio of the same mowers in use today.

No particular brand of rotary mower stood out above the others in accounting for the accidents. In 82 per cent of the cases the motor was running at the time of the injury. Wet grass with resulting clumping accounted for 25 per cent of the cases. In these instances, the wet grass clumps led the operator to reach into the opening in the blade housing without knowing the close proximity of the blade to the grass discharge chute. The guard was absent over the blade in 51 per cent of the cases. However, the guard was cited as being solely responsible for the injury in 33 per cent of the cases.

TREATMENT

The majority of our cases required hospitalization for surgical debridement and repair. Surgical debridement of the badly crushed digits was performed, and where primary closure was not possible, free skin grafts or cross finger pedicle grafts were performed. Thirty per cent of our cases required amputation of the injured digit. Open reduction and immobilization of fractures was required in 60 per cent of the cases. Associated tendon injuries were not repaired primarily.

CONCLUSIONS AND SUMMARY

Power mower injuries will continue to be more prevalent commensurate with the increased use of these appliances. Direct contact injuries are caused by carelessness of the operator. The majority of the cases required hospitalization for surgical repair. The average length of temporary disability was six weeks, and permanent disability resulted in 23 per cent of the adults. Multiple digit injuries were noted in 70 per cent of the cases. It is apparent that power mower injuries caused by direct contact are severe disabling injuries resulting in economic hardship. Better public awareness on the inherent dangers of power lawn mowers is imperative to prevent these injuries. A nation-wide safety educational program directed to the manufacturers, sellers and users of power mower equipment is necessary.

Evaluation of a Screening-Technique For Urinary Tract Infections In Diabetic Out-Patients

ABSTRACT

Significant urinary tract infections have been demonstrated in 14.6 percent of a randomly selected group of 212 diabetic out-patients. A commercial screening test (Testuria) has also been evaluated as a means of identifying such patients. Properly safeguarded, the screening test has been found to be useful in the management of an out-patient population. No false negatives were recorded; a negative Testuria result was always associated with a negative quantitative agar plate culture. But the incidence of false positives was high. Some 30 percent of all positive Testuria results were associated with insignificant colony counts on hospital agar plates in single comparison studies.

"Suspicious" or positive results with Testuria should be confirmed by standard agar plating of another urine specimen before diagnostic or therapeutic decisions are taken. Negative results with Testuria may be accepted at face value.

BY ALI ABBASI, M.D.
LAWRENCE POWER, M.D.
DETROIT

INTRODUCTION

Urinary tract infections are common in patients with diabetes mellitus. They have been reported to be 3-4 times more common in diabetic populations by autopsy studies,[1, 2] renal biopsy,[3] and clinical studies.[4] Recent emphasis on the value of quantitative urinary bacterial cultures in identifying significant urinary tract infection had led to the development of a number of procedures for this purpose.[5] In the present study we have compared the results obtained with a commercially-available urine culture technique (Testuria) with a standard hospital agar plate procedure, in a diabetic out-patient population.

MATERIALS AND METHODS

During the study, 212 randomly-selected out-patients with diabetes mellitus were screened for urinary tract infections. The study was done over an 8-month period during two clinic mornings each week. The composition of the population is shown in Table 1 and the modes of management of their diabetes in Table 2. A mid-stream clean catch specimen was obtained by the patient after instruction from the nurse. The external genitalia of both male and female patients had been washed with a solution of green soap and 1:1000 zephiran. Routine chemistries and a microscopic examination were also performed on each urine specimen.

Diet Alone	16	7.5
New Patients	9	4.2

Doctor Abbasi is a resident in Endocrinology and Metabolism at Detroit General Hospital, and Doctor Power is Associate Professor of Internal Medicine and Chief of the Section of Endocrinology and Metabolism at the Wayne State University School of Medicine Department of Medicine.

In the technique followed, an inoculum of the specimen was delivered to Testuria plates by means of the filter paper strip which comes with the plates, was dipped into the urine, and applied to the culture medium. The plate was then incubated in the supplied incubator at 37° C. for 24 hours, and the number of colonies counted.

After Testuria plating, the remaining urine was sent to the bacteriology laboratory of Detroit General Hospital and plated by means of a standard loop designed to handle 0.01 ml. Gram positive organisms were sought on an eosin methylene blue medium, and colony count estimates made the following day. Atypical organisms and non-lactose fermenters were further identified through standard bacterial-biochemical flow techniques.

RESULTS

A total of 212 patients were studied and 288 paired Testuria and agar plate cultures performed. Testuria colonies were counted and classified into three groups: Group I contained 0-2 colonies; Group II, 3-25 colonies; Group III, more than 25 colonies. As suggested by the manufacturer, Group I was considered equivalent to a quantitative plate count of less than 25,000 bacteria per ml. of urine, and interpreted as negative. Group II was considered to be "suspicious," and the manufacturer recommends that cultures in this group be repeated. Group III was said to be equivalent to a quantitative plate count of 100,000 bacteria or more per ml. of urine. The results of our comparisons are shown in Table 3. More than 50,000 bacteria colonies per ml. of urine are considered, at this hospital, to signify a urinary tract infection.

Group I or negative culture results (Table 3) were in agreement with the quantitative plate count. The great majority of Group II, or "suspicious" results did not signify urinary tract infection when compared to the agar plate standard. This tendency to over-diagnosis extended into the Group III comparisons where 16 out of 53 Testuria positives did not prove to be significantly infected by standard hospital agar plate comparisons.

Thirty-one of 212 screened patients had significant bacteriuria, for a prevalence of 14.6 percent. When sexes were considered separately, 5 of the patients were male, and 26 were female, for a 7.3 percent and 18 percent prevalence, respectively. Twenty-four patients were asymptomatic, while 9 (22.5 percent) had mild-to-moderate symptoms, such as dysuria and back or flank discomfort. No patient was febrile. The incidence of comparable symptoms in those patients screened who did not have significant bacteriuria, was 17.6 percent (32 of 181), and indicates the need for a routine screen for infection regardless of the patient's symptoms, or lack of them. Proteinuria was demonstrated in 66.6 percent of the specimens from patients with bacteriuria, while it was present in only 36.9 percent of the specimens of patients without significant bacteriuria.

Examination of centrifuged urinary sediments (Table 5) revealed a significant deposit of bacteria (++ or more) in 63.6 percent of infected urine specimens, but in only 11.5 percent of uninfected specimens. Other findings on microscopic examination, such as white blood cells, mucus, and casts were not significantly different between infected and non-infected groups (Table 5).

TABLE 3

A Comparison of Testuria and Standard Quantitative Agar Plate Cultures

(Clean-catch Urine Specimens of Diabetic Out-patients)

Testuria Results	Agar Plate Results	Number of Comparisons
0-2 colonies	< 10,000	191
3-25 colonies	< 10,000	39
	10,000-50,000 ..	4
	> 100,000	1
> 25 colonies	< 20,000	16
	> 50,000	37

TABLE 4

Organisms Responsible for Urinary Tract Infections
(More than 50,000 Organisms per ml. on Agar Plate)

	E. coli	Aerobacter	Proteus	Gamma Streptococcus
Male	2	3	0	0
Female	17 (9 pts)	10 (9 pts)	4 (3 pts)	1
Total	19	13	4	1
Percentage	51.3%	34.1%	10.8%	2.7%

TABLE 5

Microscopic Findings in Urine Specimens
Of Screened Diabetic Patients

Findings per high power field	Incidence	Percentage
++ or more bacteria	21 of 33 infected specimens 17 of 147 uninfected specimens	63.6% 11 5%
more than 10 WBC	9 of 33 infected specimens 25 of 147 uninfected specimens	27.2% 17%
more than 20 WBC	7 of 33 infected specimens 14 of 147 uninfected specimens	21.2% 9.5%
Casts	10 of 33 infected specimens 55 of 147 uninfected specimens	30.5% 36.0%

DISCUSSION

The prevalence of urinary tract infections in our male and female diabetic out-patients, as revealed by this study, is 14.6 percent. When the sexes are considered separately, 7.3 percent of the screened males and 18 percent of the screened females have significant bacteriuria. Observations in this range have been reported by other workers[6, 7] and underline the need for a routine screening procedure among diabetics, whether they are symptomatic or not, if infection is to be recognized and functioning tissue saved. Testuria provides help in this objective, but tends to err on the side of false positives. Positive or "suspicious" results with Testuria are an indication for repeat evaluation of the patient and standard agar plating of another urine specimen. Our experience indicates that negative results with Testuria are quite reliable.

Sixteen specimens in Testuria Group III yielded quantitative agar plate counts of less than 20,000 bacteria per ml., but in 5 of these specimens there were several grossly different bacterial colonies. This in itself suggests contamination. If these 5 specimens are disregarded, the false positives occurring with Testuria culture become 11 of 288 urine specimens, or 3.8 percent. The likelihood that a positive Testuria result signifies urinary tract infection is increased if the urine specimen also contains protein and shows deposits of bacteria in the centrifuged sediment.

ACKNOWLEDGEMENT

The Treatment of Trigeminal Neuralgia And Other Facial Pain with Carbamazepine

BY K. I. KILUK, M.D.
R. S. KNIGHTON, M.D.
J. D. NEWMAN, M.D.
DETROIT

In recent years, there have been many reports in the literature on the successful treatment of trigeminal neuralgia with Carbamazepine (5H-dibenz- [b, f]-azepine-5-carboxamide),[1-7] an anticonvulsant drug developed by Geigy Pharmaceuticals. The brand name is Tegretol.®

This paper will report our experience in treating 192 patients. Table I summarizes our initial group of 123. Ninety-eight patients had true paroxysmal pain in the distribution of the trigeminal or glossopharyngeal nerve. Sixteen patients had facial pain which did not meet the characteristic features of trigeminal neuralgia, either by type, location or duration of symptoms. The remaining nine patients were treated with Tegretol in the hope that it would help in the management of these difficult problems.

In the initial 18 months of our use of Tegretol, the active compound was compared with a placebo in a double blind study. Tegretol or the placebo was given to the patients in previously coded packages. The patients were re-evaluated after a few weeks, the code was checked and if they were on the placebo and without relief, they were given the active compound. As soon as we were convinced the Tegretol was effective (Table II), we discontinued the double blind study. The placebo was effective in only 10 percent, compared to 71.3 percent when Tegretol was given.

Tegretol is an iminostilbene derivative related to the tranquilizer, Tofranil.® It is not related to diphenylhydantoin.[8] The usual starting dose was 100 milligrams, three times per day. The patient obtained relief on this dosage usually within 12

hours. If this was insufficient, the dosage was increased after a few days to 200 milligrams, three times a day. After relief was obtained, the dosage was decreased to the lowest dosage which offered satisfactory relief and frequent attempts were made to discontinue the medication.

In the initial two years of the study, treatment was limited to three months by Federal Drug Administration Regulation. Later, this period was extended and finally removed.

RESULTS OF TREATMENT

A satisfactory response consisted of enough pain relief so that the patient desired to remain on the medication. There was complete pain relief in almost all of the cases. The medication was given to 118 of the 123 patients; the other five received the placebo alone. Trigeminal neuralgia had a favorable response in 88 percent of the cases. Only 20 percent of the patients with atypical facial pain had a satisfactory response (Table III). Of the remaining 13 patients, only two obtained satisfactory relief and both of these had glossopharyngeal neuralgia. Ninety patients had trigeminal neuralgia. Complete pain relief was obtained in 46.6 percent of these patients when they were on the medication (Table IV). The pain returned immediately when the medication was stopped. Of the remaining patients who had complete relief, 14.4 percent had only initial relief with the pain returning while they were on the medication and 14.4 percent had no return of the symptoms when the medication was stopped. This last group of patients probably was in a period of remission that is usually seen in trigeminal neuralgia.

In our final tabulation, we include 69 additional patients, bringing the total number to 192 patients treated with Tegretol. Of this total, 48 patients with trigeminal neuralgia underwent surgical procedures for further relief of symptoms. Table V lists the reason for the surgical treatment. In addition, three patients refused to take the medication when offered.

SIDE EFFECTS

Tegretol is a potent drug with frequent side effects, mainly dizziness, ataxia, nausea and vomiting (Table VI). Most of the side effects are transient and either disappear after a few days or by a reduction in the dosage. A large number, however, were considered severe enough to necessitate stopping the medication. These side effects usually cleared rapidly when this was done.

A white blood count, hemoglobin, reticulocyte count and blood smear were obtained every two weeks, and a serum creatinine, transaminase, urine analysis and alkaline phosphatase every four weeks.

One death occurred due to aplastic anemia and toxic hepatitis. This patient refused to get the re-

quired laboratory tests in the last two months of treatment, although he was warned repeatedly about the potential hazards of the medication. The aplastic anemia was discovered when the patient underwent emergency surgery for an incarcerated hernia. He had not been taking any other medication at the time and no other cause was found.

A second patient had an elevation in the transaminase, alkaline phosphatase and bilirubin. The jaundice was due to intrahepatic bile stasis and slowly improved when the medication was stopped. A liver biopsy revealed a normal liver architecture with much bile pigment compatible with intrahepatic cholestasis. No other cause for the jaundice was found when the patient was worked up.

DISCUSSION

The mechanism of the pain production in trigeminal neuralgia is still undetermined. There are two primary theories about the etiology of trigeminal neuralgia: One is peripheral; and the other central.

Dandy[9] in 1934 thought that the cause of trigeminal neuralgia was located peripherally in the sensory root of the trigeminal nerve. The fifth, seventh, ninth and tenth cranial nerves are all subject to tic pain. All of these roots have parasympathetic fibers, including the fifth nerve.[10] The parasympathetic fibers of the trigeminal nerve are thought to innervate the erectile tissue of the vibrissae which are present in lower mammals.

Gardner[11] postulated that trigeminal neuralgia is the result of a retained phylogenetic reflex. The afferent tactile stimulus causes an afferent (parasympathetic) response which excites the pain fibers through an artificial synapse produced by pressure on the nerve root. The pressure causes a localized demyelination and short circuits two adjacent axons. Electron microscopic examination of the ganglion cells of the trigeminal nerve showed vacuolation and segmental demyelination with denuding of the axis cylinders.[12] The various causes of pressure on the root have been arterial compression,[13] petrous ridge compression,[14] aneurysm, tumors and the internal carotid artery.[15]

The central etiology of tic douloureux has been extensively investigated and supported by King.[16] Stimulation of the infraorbital nerve in a cat gives an afferent spike followed within 5 m. sec. by a complex of deflections from the brain stem to the periphery. This is thought to be a dorsal root reflex.[17] This reflex is probably polysynaptic as is the linguo-mandibular reflex which is depressed by Tegretol. This reflex can be increased by strychnine injections in the region of the nucleus caudalis of the fifth nerve[16] with a marked over-reaction to a light tactile stimulus in the distribution of the trigeminal nerve. King thinks that a wide number of lesions within the central nervous system affect the excitability of this system which has its synapse in the nucleus caudalis. Lidocaine, Hydantoin and possibly Tegretol depress this reflex.

Strychnine renders the nervous system more excitable by lowering the threshold of excitability, by preventing the loss of excitability from continuous stimulation and by prolonging the period of hyperexcitability which normally follows nerve stimulation.[18] Tegretol has a prominent anticonvulsant effect with respect to strychnine and counteracts these effects. Tegretol possibly does the same in trigeminal neuralgia by raising the threshold of excitability and by interrupting the period of hyperexcitability caused by either (1) short circuiting of two adjacent damaged neurons, as in the peripheral theory of trigeminal neuralgia or (2) by an increased dorsal root reflex from a central cause.

Our results are in agreement with the studies in the literature.[1-7] We have found Tegretol to be very effective in the treatment of trigeminal neuralgia and also some use in glossopharyngeal neuralgia. It is generally ineffective in treating atypical facial pain and is about the same as the placebo. Unfortunately, the incidence of side reactions are high and potentially dangerous. There have been three other reported cases of aplastic anemia.[5, 19] This is by far the most serious of the side effects and frequent laboratory tests must be made as suggested by the manufacturer. In our experience, a large number of the patients eventually ask to have a surgical procedure done, which has proved to be less costly, more permanent, and is free of serious complications.

In our opinion, Tegretol will have its greatest use in:

1. Patients with an acute attack of trigeminal neuralgia while they are awaiting surgery.
2. Patients who are poor surgical risks because of age or health.
3. Patients in whom the diagnosis is not clear and further time for evaluation is necessary.
4. Patients who would prefer to postpone a surgical procedure.

It should not be used in treating atypical facial pain or other pain problems because of its toxicity and lack of effectiveness in these conditions.

SUMMARY

One hundred ninety-two cases of trigeminal neuralgia, atypical facial pain, and various other conditions were treated with Tegretol. Three to six hundred milligrams of Tegretol were sufficient to stop 88 percent of trigeminal neuralgia within one day. It was ineffective in treating atypical facial pain and was moderately effective in glossopharyngeal neuralgia. The medication has frequent and potentially serious side effects and one of our patients died from aplastic anemia. Although the medication is effective, many of the patients eventually decided on surgical procedure for more permanent control because of the reasons listed in Table V.

Acute Myocardial Infarction Preceding Diabetes Mellitus

BY MARJORIE PEEBLES-MEYERS, M.D.
DETROIT

That diabetes mellitus occurring in persons under fifty years of age (and probably at any age) is an accelerating factor in atherosclerosis has been well known for many years.[1,2,3] This is well illustrated by the higher frequency of coronary artery disease and peripheral vascular disease in the diabetic population as compared to the general population.[2,4]

Over the past several years we have become increasingly aware that some patients suffering from myocardial infarction may have hyperglycemia. This abnormality reverts to normal within a few days in the majority of cases, but often a few patients will continue as true diabetics. In one series, Wahlberg of Sweden subjected 190 survivors to intravenous glucose tolerance tests after recovery from their initial attack of myocardial infarction, and found frank diabetes in 12% of those under 50 years. The prevalence increased with age.[5]

This is one side of the coin. The following case history illustrates the obverse—namely, that myocardial infarction may portend diabetes.

J.P., A THEN 47-YEAR OLD MALE EXECUTIVE, was seen initially because of the sudden onset of nausea and vomiting occurring sporadically during the preceding night, but unaccompanied by chest or abdominal pain. Blood pressure, pulse, respiration were normal. Temperature was 100°F. Except for a murmur consistent with mitral stenosis, no other abnormalities were noted.

The patient had scarlet fever at ten years of age. His family was informed that he had developed a "heart murmur." Despite this the patient maintained an active life without restrictions.

There was no known family history of diabetes, but his father, a paternal uncle, and an older brother all had died of coronary artery disease prior to 50 years of age. Though hypertensive, his mother was alive at 78 years as were four siblings. While hospital arrangements were in progress, the patient became sweaty and anxious. On re-examination the blood pressure was 60/40. Atrial fibrillation with a rapid ventricular rate was observed. The admitting electrocardiogram confirmed the arrhythmia and revealed an extensive acute anterior myocardial infarction.

On admission and during his hospital stay fasting and post-prandial blood sugars were normal. One year later on routine examination following a three-day, 300-gram carbohydrate diet, a four-hour oral glucose tolerance test was normal. Two years later a two-hour post-prandial blood sugar was 170 mg. per 100 ml. (true glucose). The patient was asymptomatic and had not regained his pre-infarct weight. A four-hour glucose tolerance curve at this time was positive for diabetes. With dietary manipulation, the patient has maintained excellent control of his blood sugar levels.

This case merely serves to highlight the fact that acute myocardial infarction may be a "prediabetic" sign. Following myocardial infarction, patients should be evaluated at appropriate intervals for diabetes.

Faulty Neurologic Integration With Perceptual Disorders in Children

AN ABRIDGED TREATMENT APPROACH; A TWO-DIMENSIONAL PROGRAM OF METHYLPHENIDATE AND PSYCHOLOGIC MANAGEMENT

ABSTRACT: The high incidence of learning disorders among school children, based on perceptual abnormalities with concomitant emotional problems, poses a burdensome responsibility on the community and the medical profession. Various modalities, involving prolonged re-training in special clinics and institutions, have not only deferred beneficial gains for the afflicted children, but have permitted exploitation of their parents by para-, as well as pseudo-, medical groups. Such considerations have prompted our promulgation of a practical, expeditions approach to the therapy of perceptual disorders in children with faulty neurological integration, utilizing, for the most part, the services of a physician and clinical psychologist in a private practice setting. Our experiences with over 100 such cases are delineated; and, of these, 3 representative case histories are presented in detail. Methylphenidate, the drug of choice, together with psychologic support, effected highly successful results rapidly, and often dramatically.

BY SAMUEL J. NICHAMIN, M.D.
GEORGE D. BARAHAL, Ph.D.
BOTH OF DETROIT

During the past decade, educators, psychologists, and physicians have been inundated with a bewildering onslaught of investigations in the rapidly expanding field of learning disabilities associated with minimal cerebral dysfunction. Emotional problems engendered by a child's educational failures comprise an impressively large segment of the syndrome. Those concerned with emotional, psychologic, and environmental problems have been prone to ignore or neglect the use of drugs, whereas organicists have concentrated on psychopharmacologic products. Hence, no definitive therapy has been promulgated; and beneficial results, by and large, remain indeterminate for either modality. In such an area of indecision regarding effective therapeutic methods, parents, teachers, and patients can readily succumb to attitudes of frustration and despair.

The hyperkinetic syndrome, or its counterpart, the hypokinetic (lethargic) child with sluggish mentation, has a behavioral cluster which consists primarily of motor restlessness of varying degrees, impulsivity, and distractibility in perceptual and congnitive spheres. Comprehensive, basic data garnered for the study of this clinical entity, has hitherto necessitated the provision of a large, multidisciplinary staff organization, consisting of administrators, psychiatrists, pediatricians, opthalmologists, neurologists, psychologists, social workers, teachers, and speech or hearing specialists. For the practical application of available knowledge in this vital area of learning disorders, an extensive proliferation of these medical centers or child guidance clinics would be an unquestionable desideratum. However, in terms of community and financial resources, a requisite program for such elaborate complexes would represent an unattainable and realistic expectation.

To avoid semantic confusion in the nosology of brain dysfunction, with its implication of brain damage or mental retardation or both, we propose the term, "faulty neurologic integration with perceptual disorders" for children who are thus afflicted. In the psychologic and educational spheres, emphasis has centered on motor re-learning, with training exercises in coordination, remedial reading, and even cultist-type abstruse methods provided in special private schools and institutes, with results of questionable authenticity. Furthermore, these training procedures are prohibitively expensive and of prolonged duration.

Despite the gamut of disparate factors comprising this vital problem of perceptual and learning disorders in children, effective integration of all

---

Generic and Trade Names of Drugs
Methylphenidate hydrochloride—Ritalin (Ciba)
Amphetamine sulfate—Dexedrine

relevant information from the various disciplines involved can be unreservedly entrusted to the family physician. In a simplified, basic, two-dimensional program of methylphenidate and psychologic management, the clinical psychologist performs an indispensable function. He is responsible for the assessment of all mental and emotional findings, and should be involved with every phase of treatment.

In the light of this joint endeavor, combining the medical and psychologic responsibilities in a private office type of practice, independent of an elaborate, and often redundant hierarchy of interdisciplinary functions, we are herewith presenting our experience with over 100 patients with this syndrome. Our primary remedial purpose was to limit our efforts to the use of a specific, psychostimulant drug (methylphenidate) of proven efficacious value in such children,[2,3,4] together with the provision of psychological support for the patient and family. The latter function does not imply exhaustive, long-term, intensive psychotherapy.

In view of the array of publications in this field, documented and qualified, it would appear redundant and beyond the scope of this paper for us to re-explore the areas of diagnosis and the neurophysiological theories for drug therapy of hyperkinesis with perceptual disorders. In accordance with Eisenberg's[3] studies and observations of these problems, we adhered to his two-dimensional program of stimulant drug therapy (methylphenidate) and supportative psychologic guidance. Our experience with more than 100 children diagnosed as hyperkinetic or lethargic, with associated malfunction of neurologic integration, cooroborates his optimistic conclusions that at least two-thirds or more[4] of these individuals show dramatic response by these methods. With a purported incidence of 10 to 20 per cent of the school population having learning or perceptual disorders, the promulgation of such a practical, expeditious approach to therapy, within the milieu of private medical practice, seems warranted.

METHOD OF STUDY

At the outset, children with these problems received a complete physical examination, covering all aspects of muscular, metabolic, and neurologic functioning. Significant areas in the history pertaining to prenatal, natal and perinatal incidents, as well as serious infections, were evaluated. It was our intention to screen out those children with overt symptoms or signs of brain damage, or whose history strongly suggested factors significant in the etiology of organic brain involvement. Neurologic consultations and EEGs were not routinely secured.

Psychologic evaluation was then carried out by the psychologist co-author. Psychologic tests included the Wechsler Intelligence Scale for Children (WISC), the Bender Gestalt, Frostig, figure drawing tests, and various standardized academic achievement tests, to determine grade-level functioning. Where indicated, personality tests (Rorschach, Thematic Apperception Test (TAT) were employed. Tests of laterality, stereogenosis, and visual and auditory perceptual tests (modified from Birch) were also included. Family imbalance and neurotic interaction were investigated, as well as inappropriate disciplinary management. Awareness of the strategic relevance of the family dynamics was a crucial aspect of the diagnostic and remedial program, as also stressed by Eisenberg.[3] It should not be inferred that, within the psychologic dimension, a prolonged, intensive program of psychotherapy was deemed inevitable. On the other hand, short-term supportive guidance proved to be practical, and entirely adequate.

In our study, methylphenidate was exclusively prescribed in doses ranging from 2.5 mg. twice daily, morning and noon, in the preschool child, to up to 20 mg. or more in the post-pubertal individual. The drug was initiated with relatively smaller doses and then gradually increased by small increments over a period of a week or two, in order to ascertain any evidences of intolerance or adverse side-effects. As treatment pro-

CHART

Methlyphenidate Dosage Schedule For Children With Faulty Neurologic Integration With Perceptual Disorders (Minimal Cerebral Dysfunction)

Age	Dosage
3 - 6 years	2.5 mg a.m. and noon for 3 days, then 5.0 mg a.m. and noon for 3 days, then 7.5 mg a.m. and 5 mg at noon, and then continued as directed.
6 - 12 years	5 mg a.m. and noon for 3 days, then 10 mg a.m. and noon for 3 days, then 15 mg a.m. and 10 mg at noon, and then continued as directed.
12 - 18 years	5-10 mg a.m. and noon for 3 days, then 15 mg a.m. and noon for 3 days, then 20 mg a.m. and noon, and then continued as directed.

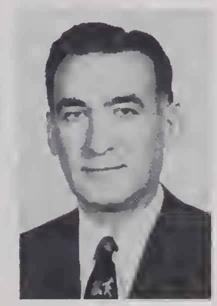
gressed, continuing contact with the mothers prevailed until a requisite dosage level was established, capable of eliciting an optimum behavioral and cognitive efficiency. Bimonthly follow-up visits were routinely recommended. The relative absence of adverse side effects with this drug permitted its uninterrupted utilization over prolonged periods.

A survey in detail of each of our cases would be inappropriate in an article of this type. However, consideration of a few representative cases might clarify our procedures in the effective management of youngsters with perceptual disorders.

CASES

1. L. P. MALE, first seen at six years, four months of age. From infancy he had manifested extreme hyperkinesis, motoric and verbal, with disruptive behavior in kindergarten, home, and neighborhood. Impulsivity, awkwardness, and accident-proneness were present. All the usual management techniques were inadequate. The WISC revealed the following: Verbal IQ 135, Performance IQ 115, and Full Scale IQ 128 (very superior range). The most striking feature of Wechsler functioning in this very bright boy was the marked discrepancy between the Verbal and Performance IQs as noted. Visual perceptual disturbances were strongly evident. The Bender Gestalt test showed poor quality, lack of control, impulsivity, and perseveration.

CO-AUTHORS



NICHAMIN

BARAHAL

Doctor Nichamin is senior attending pediatrician at Children's Hospital of Michigan, Detroit; assistant clinical professor of pediatrics at Wayne State University Medical School, and in private practice of pediatrics. Doctor Barahal is professor of educational and clinical psychology at Wayne State University, psychological consultant to several school systems, and a member of the Michigan Commission of Certification of Psychologists.

Physical examination revealed normal growth and development for his age, with no organic basis for his overt hyperkinesis. Short attention span, inappropriate and irritating conduct, and excessive verbalization were prominent characteristics observed in the office. There were no relevant factors in the prenatal, natal, or perinatal histories; and the past medical history revealed no serious illnesses or accidents. Genetically, it was ascertained that his father had also exhibited a hyperkinetic profile.

Methylphenidate therapy was instituted. With the establishment of the appropriate dosage level, both parents and teachers reported an immediate complete reversal of the hyperkinetic pattern of behavior. He became amenable to ordinary school routines. His academic achievements were finally compatible with his superior IQ. Motor coordination, fine and gross, approached the normal. This was confirmed by actual samples of pre- and post-therapy written work. The family climate was then significantly altered beneficially. In this case, no further psychologic assistance or supportive tutoring was required.

2. M. A. MALE, AGED SIX, had evidenced a moderate degree of hyperactivity, restlessness, short attention span, with poor coordination, during the preschool years and continuing into kindergarten. It was our opinion that the hyperactivity would have been much more apparent during these years had the parents been more permissive. They had set strict limits for the child towards acting-out and unacceptable behavior; and had established considerable structuring in his management. However, in a normal kindergarten milieu, the above-mentioned symptoms were triggered off and made more manifest. His physical growth and development from early infancy had been completely normal. There were no significant factors in the birth or past medical history.

On psychologic testing at the age of six years and two months, he scored as follows on the WISC: Verbal IQ 116, Performance IQ 111, and Full Scale IQ 115 (bright-normal range). The one significant drop in functioning occurred on the

Coding subtest where he manifested disturbed visual-motor-perceptual functioning. His Bender Gestalt reproductions were immature, with poor organization; and he revealed considerable difficulty with touching and overlapping parts and angulation. Ocular pursuit in reading was exceedingly poor, as evidenced by an inability to follow along a line or pursue a visual object. Reading and word-attack skills were non-existent, despite his high intelligence. His behavior throughout the testing suggested the presence of a perceptual disorder with faulty neurologic integration.

Soon after the dosage of methylphenidate was stabilized at 20 mg. daily, hyperactivity, distractibility, and restlessness were decreased markedly. The child now seemed amenable to the learning process.

Supportive reading tutoring was begun once weekly. School functioning improved dramatically. Achievement levels, as measured by the Metropolitan Achievement tests, revealed within less than a year, that he was performing above grade level. His current report card is completely confirmatory of his educational progress, with outstanding ratings in following directions: listening, respecting authority and property, and spelling. Parental attitudes have been transformed from frustration and anxiety into a more approving acceptance of their child and his progress. Their elation with this "new child" has been most rewarding, and has been reflected in a more wholesome, optimistic, and tension-free family climate.

3. D. H. WAS AN ADOPTED MALE CHILD who came under our health supervision at the age of nine and one-half months. There were no relevant factors in the medical or developmental histories. There had been parental preoccupation with bowel evacuation, as well as a multiplicity of minor complaints involving accidents or infections. These factors tended to obscure a basic hyperkinetic pattern that reached an acme at the age of three years. Marked distractibility, hyperkinesis, low frustration tolerance, and temper tantrums then became more apparent. Disciplinary techniques failed to alter the boy's unacceptable behavior. The parents sought relief from an intolerable, chaotic home atmosphere.

On the Stanford Binet Intelligence Scale the child achieved an IQ of 125, which placed him in a very superior category. His extremely immature behavior belied his high intelligence. He also revealed marked perceptual deficiencies, as evidenced in the perceptual-motor tasks. Both on the Binet and Winterhaven gestalts his performance was erratic and considerably below the expectations for his age group. Throughout the testing he manifested restlessness, hyperactivity, impulsivity, and an inability to cooperate. No additional tests were attempted because of his distractibility. He showed particularly strong capacities in verbal and abstract reasoning ability. His draw-a-person was inferior and immature. Copying of simple designs was totally inadequate. Performance on the mazes was replete with impulsiveness, poor judgment, and fine muscle incoordination.

After methylphenidate was introduced, a complete metamorphosis in the child's behavior occurred. Gloom and doom in the family environment were replaced by acceptance and serenity. At certain times the parents reported a brief spell of a peculiar lethargy and mild disorientation. Such incidents had been previously noted in a small percentage of our cases. Usually this aberrant reaction disappears upon a temporary (one week) withdrawal of the drug, followed by reinstitution at low levels of dosage, and then gradual increase to former levels with smaller increments than previously employed.

COMMENT

Emphasizing the use of methylphenidate in perceptual disorders need not be construed as a laissez-faire approach to all learning and behavioral deviations. Definitive pediatric and psychologic diagnosis of this entity of faulty neurologic integration is the sine qua non for effective results with it. Clear-cut evidence of the syndrome must be pinpointed through careful clinical observations and requisite psychologic testing.

There is no gainsaying that, at the very outset, a thorough physical and neurologic examination is the physician's responsibility, and recourse to specialized consultation (ophthalmologic, auditory, speech, EEG, etc.) is mandatory when indicated. In evaluating family histories, we have been strongly impressed with the predominance of genetic factors relating to this syndrome. Promiscuous use of this drug for a variety of school and behavior disorders, without a definitive diagnosis, would be shortsighted and inappropriate.

Early identification and diagnosis is possible, even at the pre-school level. A preventive program for private practice has been presented by one of us (S. J. N.).[5] In fact, federal financing has been approved for surveying this age group for potential perceptive and learning disabilities (Oak Park, Michigan, Board of Education). Early detection of the syndrome is also stressed by Boelsch.[6] During the preschool period, as well as in early infancy, awareness of the hyperkinetic syndrome can afford the opportunity of longitudinal observation and consequent earlier definitive diagnosis and drug administration. Such early drug therapy, with its consequential beneficial effect, can forestall serious ego damage to the child. Untreated, such a child would develop a depreciated self-concept and patterns of desperation and defeat. Likewise, a chaotic family ego disorganization can be ameliorated before cumulative damage is perpetuated. Intensive psychotherapy and miscellaneous lengthy perceptual-training exercises can be avoided.

The physician should carefully prescribe the drug dosage on an individual basis. The accompanying chart can serve as a useful guide, but gradual increases in dosage, up to twice the basic dose, may be necessary with growth or at times of stress. No change or improvement in the child's functioning or behavior is discernible until appropriate levels of dosage are attained.

Medication must be of a continuing nature and should not be omitted on weekends and vacation periods. The omission of even a single dose of the medication on a given day becomes readily apparent to the child himself, as well as to his parents and teachers. In some patients the effect of the drug given at noon is lessened or lost by late afternoon; parents then note a regression to former immature behavior patterns. The situation can be remedied by administering a small (2.5 mg. or 5.0 mg.) dose of the drug at such times.

SUMMARY

Based on our experience in private practice with more than 100 cases of faulty neurological integration with perceptual disorders, a two-dimensional, medical-psychological and pragmatic approach to therapy is presented, employing methylphenidate as the drug of the choice.

Marked Eosinophilic Response to Combined Chlorpromazine and Trifluoperazine Therapy

BY MELVIN J. REINHART, M.D.
MARTHA STEPHENS, M.D.
ANN ARBOR

While it is generally known that mild to moderate eosinophilia can be representative of responses to allergens, be they dietary, inhalant, or drug, a review of the medical literature for the years 1960 through 1967 reveals only two reported cases of eosinophilia during therapy with psychotropic drugs. Joynt and Clancy report[1] in 1961 an eosinophil count of 61 percent in a patient receiving imipramine therapy with a total white blood cell count of 30,000. The blood elements rapidly returned to normal following a discontinuation of the medication. In 1964 Bacon[2] reported a case of leucocytosis with an eosinophilia of 41 percent during therapy with chlorpromazine, which likewise returned directly to normal upon discontinuation of the medication.

Our case represents, to the best of our knowledge, the first significant eosinophilic response to the combined chlorpromazine and trifluoperazine regimen which is so frequently used in treating psychotic patients.

CASE REPORT

The patient is a 40-year-old Caucasian female; a housewife who was hospitalized at the Neuropsychiatric Institute on November 17, 1967. She had expressed self-destructive and murderous thoughts toward family members prior to her admission.

The initial psychiatric examination revealed a moderate degree of agitation in a depressed woman. The other significant findings indicated she was probably experiencing auditory hallucinations. The physical examination revealed no particular physical abnormalities with the exception of a cystic enlargement of the left ovary felt to represent a functional ovarian cyst. The admission laboratory studies were all within essentially normal limits including a total white blood cell count of 8,400 with a differential cell count of 47 percent polymorphonuclear neutrophils, 45 percent lymphocytes, 8 percent monocytes, and zero percent eosinophils and basophils.

In order to treat her anxiety symptoms, she was begun on chlorpromazine, 200 mgs. per day on the day of her admission, (11-17-67) and this was increased by November 30, to 600 mgs. per day. On that date trihexyphenidyl hydrochloride, 2 mg. per day, was added to counteract extrapyramidal symptoms which were in evidence. Because the aforementioned drug regimen was inadequate to control the degree of agitation, trifluoperazine was added, 6 mgs. per day on December 6, concomitant with an increase in the trihexyphenidyl hydrochloride to 4 mgs. per day. From December 1, through 4, the patient complained of recurrent frontal headaches, which were relieved by Fiorinal and aspirin. A white blood cell count reported on December 4 was read as 13,700. On December 6 complaints of malaise, nausea, and weakness in the lower extremities were reported in addition to a single episode of emesis. The patient reported chills and diarrhea on December 7 with a temperature elevation to 100° orally noted. The white blood cell count reported on December 8, was 17,000 with a differential cell count of 58 percent polymorphonuclear neutrophils, 18 percent lymphocytes, 2 percent monocytes, 22 percent eosinophils and zero percent basophils. The repeated white blood cell count on December 11, was read as 25,100 and four days later on December 15,

GENERIC AND TRADE NAMES OF DRUGS

Chlorpromazine — Thorazine
Trifluoperazine — Stelazine
Trihexyphenidyl hydrochloride — Artane

Both authors are associated with the Neuropsychiatric Institute at the University of Michigan Hospital.

22,400 with a differential cell count of 15 percent polymorphonuclear neutrophils, 19 percent lymphocytes, 2 percent monocytes, 63 percent eosinophils and 1 percent basophils. The patient had been treated symptomatically with Kaopectate, paregoric, and tincture of belladonna to counteract her gastrointestinal symptoms. However, these symptoms did not respond to the antidiarrheal medication, bedrest, and liquid diet.

Upon receipt of the report of December 15 indicating a 63 percent eosinophilia with a white blood cell count of 22,400 the patient was transferred to the Internal Medicine Service with a suggestive diagnosis of parasite infestation. On December 16, the chlorpromazine had been decreased to 300 mgs. daily and on December 18 chlorpromazine, trifluoperazine, and trihexyphenidyl hydrochloride were discontinued. The total white blood cell count and eosinophil differential remained elevated with a total peripheral eosinophil count of 12,028-per-cubic milimeter. By December 21 the white blood cell count had further dropped to 12,100 with a differential cell count of 34 percent eosinophils. The patient's diarrhea had ceased by this time. The diagnostic studies completed on the Internal Medicine Service included a sigmoidoscopy with rectal biopsy, a barium enema, and numerous stool examinations, all of which were reported as being normal. An upper G.I. series revealed a small hiatus hernia. A bone marrow examination demonstrated an eosinophilia of 28 percent with mature cells. Chest film, hemoglobin, and hematocrit were normal. Electrophoresis manifested a slight elevation of total protein and alpha two globulin. Liver function studies always remained within normal limits. The patient was essentially asymptomatic from a physical point of view when she was transferred back to the Psychiatric Service on December 22, 1967. The total white blood cell count on December 27, 1967 was 8,000. The counts have remained essentially with-

TABLE 1

Composite of Serial Hemograms

Reported	Total W.B.C.	P.M.N.	Lymph	Mono	Eosin	Baso	Hgb grams	Hct	Alk. Phosphatase K.A. units	SGPT units
11/20/67	9,900						16.5	47	6.9	13

1/22/68	8,700									
2/ 2/68	8,900	41	44	10	4					

in normal limits, subsequently, with the differential cell count repeated on three occasions within normal limits.

COMMENT

The above mentioned case was reported to highlight the possible association of eosinophilia with combined chlorpromazine and trifluoperazine therapy. Unfortunately, the implication of trifluoperazine is somewhat in doubt. One hemogram was completed two days after the initiation of trifluoperazine. At the time of its initiation, the white blood cell count had already been elevated on December 4, 1967 to 13,700. However, no differential cell count was done at that time. One could speculate that the eosinophilia had begun prior to the beginning of the trifluoperazine. However, in view of the relative infrequency of reported cases of eosinophilia with even chlorpromazine, the authors felt that this material should be called to the attention of the readers.

Editorial Comment:

One wonders in view of the gastro intestinal symptoms what a trichmilla skin test might have shown.

Information for Contributors

1. Address scientific manuscripts to the Publication Committee, Michigan State Medical Society, 120 West Saginaw Street, East Lansing, Michigan.

2. Submit original, double-spaced typewritten copy and one carbon copy on letter size (8½ x 11 inch) paper.

3. On page one, include title, authors, degrees, academic titles, and any institutional or other credits.

4. Authors are responsible for all statements, methods, and conclusions. These may or may not be in harmony with the views of the Editorial Staff. It is hoped that authors may have as wide a latitude as space available and general policy will permit. The Publication Committee expressly reserves the right to alter or reject any manuscript, or any contribution, whether solicited or not.

5. Illustrations should be submitted in the form of glossy prints or original sketches from which cuts, or plates, will be made by MICHIGAN MEDICINE. MICHIGAN MEDICINE will pay the first $25 of the engraving bill, and the author shall pay the balance. An estimate of the cost will be submitted to authors before cuts are ordered.

6. References will ordinarily be limited to seven in number. Exceptions may occasionally be made.

7. Contributors will be notified as soon as practical if a manuscript is accepted for publication. Unused manuscripts will be returned. Every care will be taken with the submitted material but the Journal will not hold itself responsible for loss or damage to manuscripts.

8. Articles should ordinarily be less than four printed pages in length (3000 words).

9. References should conform to *Cumulative Index Medicus*, including, in order: Author, title, journal, volume number, page, and year. Book references should include editors, edition, publisher, and place of publication, as well.

10. Specify address to which galley proofs should be sent. Proofs will be mailed to authors for correction before publication and should be returned to the editor in 48 hours. If proofs approved by the author are not received by the editor prior to deadline, publication of the article will be cancelled for that issue.

11. The editors welcome, and will consider for publication, letters containing information of interest to Michigan physicians, or presenting constructive comment on current controversial issues. News items and notes are welcome.

12. It is understood that material is submitted for exclusive publication in MICHIGAN MEDICINE.

Michigan Department of Corrections Explains School - Pass Program

The Michigan Department of Corrections has inaugurated a new program in correctional education in this state which you should know about because of your interest in civic matters.

This new program is called a "Study-Pass Program" and offers to carefully selected and qualified inmates of Michigan prisons, an opportunity for advanced technical or academic training by attending classes on the campus of nearby community colleges or state universities.

Chief purposes are to help these men test their ability to do acceptable college-level work and to assist them in making a beginning on a college course so that their training is more apt to continue when they return to the communities. In addition, the program opens up opportunities for special or advanced training which are not available at the correctional facilities.

THE BASIC RATIONALE for this new program involves the following:

1. Many men in prison have special aptitudes and skills for which there are no institutional programs because these are too expensive to equip and staff. These programs do exist in the community and it seems practical and wise to take these men to them.
2. There are many men in the prison population who have both the intellectual ability, the interest and the academic background for college-level work. Most of them have not been aware of this and, therefore, have not thought seriously about the possibilities of attending college. They represent a sizable, untapped, human potential which should be made available to society.
3. The Federal system and one or two other states have experimented successfully with this type of a venture and their experience has been used as a foundation.
4. Successful experiences of this kind should do a great deal to improve the image that these men have of themselves and help them to see themselves as more worthy persons.

THE DETAILS OF the plan are:

1. The participants are carefully screened for evidence of intellectual, academic or technical aptitude and a sincerity of interest in the training available.
2. Only those men who are fairly close to release on parole and who do not constitute in any way a menace to the students at the college or to the community generally, would be approved.
3. The participants must have demonstrated dependability and responsibility which would merit their enrollment in this kind of a program.
4. They are transported from the institution each morning to the campus where they are on their own like any other student during the day and are picked up in the late afternoon and returned to the institution.
5. They are required to follow all the college regulations which apply to the other students and, in addition, have certain understandable restrictions on their activities from the standpoint of the Department of Corrections.
6. College credits earned are available for transfer to other colleges and universities where the student may wish to continue in his work when released from the institution.

Financing is taken care of in several different ways. First, if the student or his family have sufficient financial resources he pays his own way. Second, some are eligible for assistance from the Division of Vocational Rehabilitation or under the GI Education Benefits. Third, a modest Tuition Loan Fund has been established by the Department through donations and gifts from interested citizens and is available for men who have no other resources. They draw from this fund on a loan without interest and repay from their income after release.

At the present time, the following colleges are cooperating in the program and have students on the campus: Montcalm Community College, Jackson Community College, Lansing Community College, and Northern Michigan University.

Those men presently engaged in this program have demonstrated college ability and represent a very important human resource in this state which might otherwise be wasted. □

A Case History:

The Payoff Is Rehabilitation

BY C. ARTHUR HAKENEN, CHIEF,
DISABILITY DETERMINATION SERVICE
DIVISION OF VOCATIONAL REHABILITATION
STATE DEPARTMENT OF EDUCATION

Much has been written and said about vocational rehabilitation programs. One of the primary areas of concern is that of the costs involved.

That the costs of such programs can, in some instances, be the least expensive way out for the taxpayer can best be understood with a specific example.

A neurologist's report in July of 1959 had this to say about Mr. H., age 37, after his cerebral vascular accident.

CASE HISTORY

"Spinal puncture revealed bloody xanthochromic fluid indicative of preceding subarachnoid hemorrhage. Bilateral carotid angiography showed a small vestigial aneurysm at the intracranial bifurcation of the carotid on the right and a very large bilobular aneurysm at the same location on the left with some evidence of hemorrhage into the left frontal lobe. . . .

"This patient has made a good immediate recovery from his very serious condition, but I am afraid that the partial ligation of the carotid is, unfortunately, no safe guarantee against further blow-outs; besides, the hemorrhage had been severe enough to cause considerable neurological deficit, which may not clear up completely in the future. For these reasons, I believe that this patient will unfortunately not be able to return to his former job and his outlook as to the future must remain quite guarded."

In April, 1960 checkup at the medical center showed residual mild sensory-motor deficit in the right-sided extremities and marked dysphasia. Prognosis remained guarded.

IT WAS A BLEAK picture for Mr. H., his wife and their four small children. Before the CVA he had been plant superintendent of the tool factory in a small town. Returning to this demanding management position was impossible, because of his frustrating inability to communicate; there was nothing else for which he qualified in his present status. In due course he filed for Social Security disability benefits and his case was evaluated by the Disability Determination Service of the Michigan Division of Vocational Rehabilitation. Mr. H. and his family were found eligible for a grant of $254 a month.

But the Review Physician and the Disability Examiner who adjudicated this claim did not stop there. They also considered Mr. H.'s rehabilitation potential — could he be helped by speech therapy, for example? They decided to refer him to the Vocational Rehabilitation office in his area for evaluation. The new plant superintendent also sought out the VR Counselor, to enlist his help in getting this valued employee back to work, in a job within his capacities.

Mr. H. had something in his favor: He was strongly motivated, although intermittently depressed by the CVA residuals which had diminished his value in the labor market; he had the understanding support of his wife and her interest in the rehabilitation plan.

Although the dysphasia was a formidable barrier, the VR Counselor was encouraged by the current psychological and neurological evaluations and arranged speech training at the medical center. Subsistence expense while in training was shared by the employer through his insurance coverage, the agency and the family.

DURING THIS two-and-a-half-year training period, the Counselor had many conferences with plant officials to discuss progress and employment prospects. In December, 1961 the Counselor asked the company for two sets of the pneumatic hand tool it manufactured — one completely assembled, made up of 41 small parts and the housing — and the other unassembled. He took the two sets to the occupational therapist at the medical center; between them they worked out a plan for Mr. H. to practice assembling the tool, just as it was done on the company assembly line.

Mr. H. worked hard on his speech training and tool assembly and in October, 1962 the Counselor suggested a two-week tryout in the plant. The test was successful and Mr. H. returned to work on a full-time basis as an assembler at $80 a week. He was given a twelve-month trial work period (the maximum), to test his ability to work without loss of benefits — an incentive built into the program to encourage rehabilitation. The benefits stopped in October, 1963.

The Counselor and I visited Mr. H. at his home — he was on vacation — in May, 1968 and found he was still working as assembler and happy with it. He has had several pay increases. Mr. H. still has some difficulty with writing, especially the small words; when he speaks, he has to reach occasionally for the right word. His wife, a registered nurse, told us he had made a good adjustment to working in a lesser capacity. The aneurysm on the right is still there, encased in scar tissue, but he has had no medical problems and gets a checkup every year.

WE STOPPED AT THE factory and visited with the plant superintendent and the foreman. Mr. H. has an excellent production record, we were told, and is considered a superior employee. Because of his management know-how before the CVA they would like to give him more responsibility and discussed this prospect with Mrs. H. She prefers to wait until he is ready for it.

The total cost for VR services provided came to $2,248. Now, let's take a look at the return from this investment in rehabilitation: Had Mr. H. remained idle he would have continued to draw benefits from the Social Security trust fund — $14,732 from October, 1963 through July, 1968. Actually, the amount would be considerably higher because of several increases in cash benefits enacted by Congress. In addition to this substantial saving to the trust fund Mr. H. became a self-supporting taxpayer again, and what this meant to him and his family cannot be measured.

SOCIAL SECURITY TRUST FUNDS

A 1965 Social Security amendment makes money available from Social Security trust funds to finance the rehabilitation of selected beneficiaries — those with the potential to return to productive work through VR services. The amount so released each year to the State Agencies may not exceed one per cent of the total amount paid nationally in disability benefits the previous fiscal year. For the year ending in June, 1968 Michigan received $484,224 in trust fund money.

During this period these Social Security funds made it possible for our agency to rehabilitate 362 beneficiaries, who might not have been served otherwise because of state budget limitations. The average cost for each rehabilitation was $1,108; if we use the national average for payments to each beneficiary and his dependents — $175 a month — Social Security will get back its money in less than a year of employment. We also have 1,051 clients on our active caseload, whose rehabilitation is in process.

THE JOBS OUR CLIENTS entered into were a cross section of Michigan occupations, unskilled to highly technical. Their weekly pay ranged from $40 (cafeteria helper) to $150 (automatic valve grinder). Rehabilitation services included counseling, medical treatment to correct or reduce the disability, prostheses, vocational training at various levels and job placement help.

There will be more trust fund money available for rehabilitation in the future. In Michigan, for example, the disability payments total in February, 1968 was running $6,845,447 a month; this was going to 45,063 disabled workers, their 7,405 spouses and 24,991 children. While this represents substantial buying power, a regular paycheck will bring in more for those with rehabilitation potential. The Social Security-Vocational Rehabilitation partnership wants to help more people get back to work. Rehabilitation costs money, but it pays. ☐

MSMS Members In The News

BY CAROL MAXWELL
OF THE MSMS STAFF

William M. LeFevre, M.D., Muskegon, has retired from 43 years of private practice in Muskegon to become plant physician at DuPont in Montague. For 10 years a councilor of the MSMS 11th District, Doctor LeFevre continues active in MSMS, serving as chairman of the MSMS Diabetes Committee, member of the MSMS Beaumont Memorial Committee, and advisor to the Committee on History. He is known to many as the first president of the Michigan Association of the Professions, past president of Michigan Diabetes Association, and past president of the Muskegon County Medical Society.

Wesley G. Logan, M.D., Hastings, has been appointed to the 10-member vocational service consultative group of Rotary International. He has served as a past president of the Rotary Club of Hastings and as a district governor of Rotary International. He is an alternate delegate from the Barry County Medical Society to the MSMS House of Delegates, a past president of the Barry County Medical Society, and chief of staff at Pennoch Hospital, Hastings.

C. A. Dickinson, M.D., Wayland, a past president of the Allegan County Medical Society, has ended 35 years of private practice to become medical director of the Allegan County Health Department. He has served as coronor and medical examiner since 1935.

Robert E. Bogue, M.D., Detroit, is currently president of the Michigan Society of Obstetrics and Gynecologists. President-elect of the Society is Joseph B. Woolfenden, M.D., Grosse Pointe. Serving as treasurer is John M. Malone, M.D., Detroit, and as secretary, Joseph J. Woods, M.D., Ypsilanti.

Hilliard Jason, M.D., East Lansing, discussed the educational philosophy and curriculum innovations of the Michigan State University College of Human Medicine in Helsinki, Finland, at the meeting of the 17th General Assembly of the International Federation of Medical Student Associations. Doctor Jason is director of MSU's Office of Medical Education Research and Development.

James G. Christopher, M.D., Hamtramck, has retired from his post of chief pathologist of Holy Cross Hospital, Hamtramck. He had been associated with the hospital since it opened in 1946. At different times, Doctor Christopher has been a member of the medical faculty at the University of Vienna, Wayne State University, and the University of Detroit Dental School.

Kenneth E. Pitts, M.D., Grosse Pointe, associate professor of psychiatry at the Wayne State University School of Medicine, is supervising a graduate training program in psychiatry, to be continued through a recent grant of $71,623 from the Public Health Service.

Allen B. Moore, M.D., Essexville, has accepted a position as assistant medical director of the International Harvester Company, Chicago. He resigned from the Saginaw Valley College Board of Control to which he had been appointed by Governor Romney.

Samuel T. Sandell, M.D., Houghton, was feted at a retirement dinner by his colleagues of the Houghton, Keweenaw and Baraga County Medical Society. Former head of the Copper Country Tuberculosis Sanitorium of Houghton and Hancock, he will retire in Duluth.

Norman Harebottle, M.D., Fowlerville, and family were bade farewell at an open house given by the Lutheran, Baptist, Catholic and Methodist ladies societies of Fowlerville. After 10 years in the community, the family is moving to Tempe, Arizona. Doctor Harebottle is a former president of the Livingston County Medical Society.

Robert E. O'Connor, M.D., Detroit, has been appointed to the newly-created position of Director of Clinical Development for Parke, Davis and Company. Doctor O'Connor, who will review and evaluate plans and clinical studies for new drugs and explore new applications for marketed products, joined Parke-Davis in 1963 after practicing in California. He obtained his M.D. from the University of Illinois.

Community Health Week, October 20-26

Every county medical society in Michigan is urged to develop appropriate programs marking the annual observance of Community Health Week, October 20-26 and to encourage other members of the community health team to join with them in planning and carrying out activities.

The purpose of Community Health Week (October 20-26) will be to focus public attention on the dramatic advances which have occurred in medicine and health care. The Annual Community Health Week project is proclaimed by the AMA and MSMS to stimulate a greater public understanding of the growth, high quality and availability of health resources and facilities within the individual community.

The 1968 Community Health Week this fall will focus attention upon (1) the growing problem of drug abuse, (2) the need to encourage and support the programs encompassing physical fitness, and (3) the expanding, urgent need for young men and women to train for medical and allied health careers.

Each county society has been urged to organize a health careers recruitment program. Doctors can speak to school assemblies, can consult with school counselors, can cooperate with the medical auxiliary and voluntary agencies, etc.

As in other years, the Michigan Health Council and the Michigan Association of the Professions will jointly sponsor Community Health Week with MSMS.

FOR BETTER MEDICAL CARE
A UNITED HEALTH TEAM

MSMS-MHC to Sponsor Careers Workshop Oct. 23

A special health careers conference will be held October 23 near Battle Creek for representatives of county medical societies, hospital board members, hospital administrators, school counselors, community college officials, county supervisors, nurses, and all others interested in health manpower.

The theme will be "Health Manpower Is a Community Affair."

The one-day meeting will be held at the pleasant Michigan Education Association Conference Center on St. Mary's Lake. The MSMS Committee on Rural Medical Service and the Michigan Health Council will sponsor the workshop. Robert E. Rice, M.D., Greenville, the program chairman for the event, is chairman of both the MSMS Committee on Rural Medical Service and the MHC Professional Placement Committee. Major speaker will be Milford O. Rouse, M.D., Texas, past-president of the AMA.

The agenda will cover the following topics:

Health Manpower
Role of the Community College
Role of the University
Role of the Community Hospital in health care programs
Progress report on MHC manpower study in Southwestern Michigan
Role of Voluntary Health Councils

All interested MSMS members are invited to attend, and a special appeal has been made to every county medical society president to send several representatives.

The conference will be one of several Community Health Week features.

Hearing-Speech Conclave Soon

Medical personnel interested in ear problems and those working with very young children will want to clear their calendars for Friday, September 27.

Marion P. Downs, director of clinical audiology at the University of Colorado Medical Center, Denver, will speak on "Identification of Hearing Impaired Infants" to open the Michigan Association of Better Hearing and Speech convention at the Pick-Fort Shelby Hotel, Detroit.

Mrs. Downs, an instructor in surgery in the University's otolaryngology division, is a consultant to the ENT department at Fitzsimons Army Hospital.

Theme of the convention will be "Early Identification and Habilitation of Hearing Impaired Children."

Royal C. Hayden, Jr., M.D., Detroit area otologist and director of the Otological Research Laboratory at Henry Ford Hospital, will be Friday chairman.

Urge Every MSMS Member Attend September 25-26

House to Install Lightbody, Pick Other Leaders

The election of the MSMS president-elect will be one of the highlights at the House of Delegates meeting in Sheraton-Cadillac Hotel, Detroit, September 22-25. The elections will be Tuesday night, September 24.

Four Delegate and Alternate Delegate posts to the AMA will also expire and be open for election. Current incumbents in these positions are: Delegate — Sidney Adler, M.D., Detroit; George W. Slagle, M.D., Battle Creek; Donald N. Sweeny, Jr., M.D., Detroit; Joseph A. Witter, M.D., Highland Park; Alternate Delegate — James C. Danforth, Jr., M.D., Detroit; John J. Coury, M.D., Port Huron; Marjorie Peebles-Meyers, M.D., Detroit; and Vernon V. Bass, M.D., Saginaw.

Terms of office for MSMS Councillors Milton R. Weed, M.D., Grosse Pointe Park (1st District), John J. Coury, M.D., Port Huron (7th District), A. Carl Stander, M.D., Saginaw (8th District), Edward H. Rodda, M.D., Bay City (10th District), Eugene R. Elzinga, M.D., Marquette (12th District), and Robert J. Mason, M.D., Birmingham (15th District) will expire this year.

Elections also will be held for the speaker and vice-speaker of the House of Delegates.

James J. Lightbody, M.D., will be installed as new president of MSMS at a delegate dinner meeting in the Book Casino.

The elections will cap three days of work by the House of Delegates, beginning on Sunday, September 22, at 6 p.m. with reference committee chairmen gathering for the Speaker's Dinner.

The Speaker's Dinner will be followed by the first meeting of the House of Delegates. Gerald D. Dorman, M.D., AMA President-Elect, will bring greetings to the delegates. Also speaking at that time will be MSMS President Bradley M. Harris, M.D., and President-Elect James J. Lightbody, M.D.

Other highlights of the first meeting of the House will be the report of the committees on Certificates of Commendation and Michigan's Outstanding Physician.

Delegates will consider resolutions and reports Monday and Tuesday. The Fifty Year Awards will be given Tuesday.

Sheraton-Cadillac Lifting Its Face

The Sheraton-Cadillac Hotel, looking forward to the MSMS Annual Session and other fall conventions, has just completed the first stage of a $4,000,000 renovation and improvement program.

Four hundred guest rooms and suites have been redecorated and refurnished, with plans to complete the remaining 800 rooms in the next year.

One million has been spent already for new, high-speed automatic elevators.

The hotel is currently in the process of replacing all windows on the first six floors, and eventually, throughout the hotel.

Tentative plans for a $8,500,000 addition to the hotel are being developed by Mark Schmidt, vice president and general manager. A 17-story addition will be built adjoining the present hotel, replacing the Detroit Edison building on Washington Boulevard and the Hughes-Hatcher-Suffrin store on Shelby at State. The addition will have 300 guest rooms, a swimming pool, restaurant, and fashionable shops on the ground level. There will also be an underground garage for 350 cars. The ballroom will be expanded to accommodate 1,500 persons.

BEGIN WORK SOON ON UPJOHN CENTER AT ANN ARBOR

Work is to begin shortly on the nation's first university-based research and training center devoted to clinical pharmacology.

University of Michigan officials signed papers this week awarding the $988,714 construction job on the Upjohn Center to Jeffress-Dyer, Inc., of Ann Arbor.

The Upjohn Center was made possible by a gift of $1.1 million from the Upjohn Company.

Cross-Shield Get Okay for New Building

The Detroit Common Council on August 27 approved plans submitted by Michigan Blue Cross and Michigan Blue Shield to purchase property for a new combined service center to be erected on an 11.6-acre downtown urban renewal site north of Jefferson and west of the Chrysler Freeway.

The Detroit City Housing Commission previously approved the transfer of the land and the Detroit Planning Board approved the building plans.

THE CENTER WILL consist of a 22-story administration building and a connecting three-story computer facility costing an estimated $27.5 million.

A five-deck parking garage for 1,262 automobiles which is required under city planning commission zoning regulations also will be built. The garage will cost approximately $2.9 million and will be paid for through parking fees.

Other costs include $1,203,339 for the land, plus site preparation work and architect fees. The complex has been designed by Giffels and Rossetti, Inc.

The computer facility is expected to be completed by April, 1970, and the administration building completed by December, 1970.

Project costs will be shared equally by Blue Shield and Blue Cross.

IN A JOINT STATEMENT, William S. McNary, president of Michigan Blue Cross, and John C. McCabe, president of Michigan Blue Shield, said that a substantial part of the financing will be through mortgage.

"The building program is designed for efficiency and functionalism," McNary and McCabe added. "It has no frills and it does not require any increase in rates.

"The decision was based on a 10-month study by outside consultants which showed that increasing operational difficulties would result from further scattering of operations to meet the growth in our business.

"The study indicated that it is costing Cross and Shield an extra $100,000 a month to do business from fragmented and rental locations.

"The study showed that it would cost us $4.50 a square foot to build as opposed to our present rental costs of $5.57 a square foot.

"We are therefore building to save money as well as building to centralize our operations and improve service to our subscribers and providers of service."

The corporations currently rent more space than they own.

The facilities will include a 300-seat auditorium, to be available for public and professional groups concerned with health care. The site has enough land for an additional building in the future.

Detroit Mayor Cavanagh described the proposed center as a "major step in Detroit's revitalization," and added: "The new Blue Cross - Blue Shield center is a very sizeable addition to downtown Detroit's area redevelopment. It will mean more jobs for Detroiters as the needs for medical-hospital programs increase."

Internists Confer Soon at Gaylord

Specialists in internal medicine in Michigan will hold a scientific meeting in Gaylord, September 20-21, under the auspices of the American College of Physicians (ACP).

Special guest at the meeting will be H. Marvin Pollard, M.D., ACP President, and professor of internal medicine at the University of Michigan Medical School.

The meeting at the Otsego Ski Club is under the general direction of Muir Clapper, M.D., Detroit, ACP Governor for Michigan and Professor of Medicine, Wayne University College of Medicine.

The new Michigan Blue Cross and Blue Shield combined service center will look like this architect's model. At left is the five-level parking garage, with the administration building in the center, at the corner of St. Antoine and Lafayette East. The computer facility, with separate humidity and air cleaning and conditioning controls required by its electronic equipment, is at the right.

PAC Breakfast Sept. 25 Offers Conyers, Riegle

MDPAC will hold a congressional breakfast featuring talks by Congressman John Conyers Jr., (D), Detroit, and Donald W. Riegle Jr., (R) Flint, on September 25 at the Sheraton-Cadillac Hotel during the MSMS Annual Session.

Breakfast chairman is George L. Reno, M.D., of Detroit. Assisting him are John Moses, M.D., Wyman C. C. Cole Jr., M.D., Sidney Chapin, M.D., Vernon V. Bass, M.D., and Lionel Swann, M.D.

A special guest at the breakfast will be Mrs. Frank Gastineau, an AMPAC board member from Indianapolis. Tickets for the breakfast, available from MSMS headquarters, are $4.50.

"Ars Medica" Highlight for Annual Session

Throughout the Scientific Session, *Ars Medica*, an exhibition of prints depicting medical subjects, will be on special display at the Detroit Institute of Arts. The collection comes from the Philadelphia Museum of Art, where it is on permanent display.

Established through the generosity of Smith, Kline & French Laboratories, the collection will be on display from September 22 to October 20.

Arrangements were made by the Department of Graphic Arts at the Institute and a committee of Detroit physicians who raised the necessary money for shipping the display.

Oakland University Series on Hormones Open to Physicians

The Third Post Graduate Professional Education Symposium Series sponsored by Oakland University for area physicians will begin Sept. 17.

The series of programs is designed to furnish interns, residents and practicing physicians basic information on hormones and their action along with new knowledge on recent developments in the important field of endocrinology and clinical applications of this knowledge in selected areas of medical practice. All sessions are scheduled 7:30 to 9:30 p.m. in Room 195 of the Science Building.

The first session, Tuesday, Sept. 17, is entitled "How Hormones are Made" by Piero P. Foa, M.D., WSU.

The second session, Tuesday, Oct. 1, "How and Where Hormones Work" is also by Dr. Foa.

On Tuesday Oct. 15, the third session will be held. "New Concepts of Diabetes" is the topic for George C. Gerritsen, Ph.D., The Upjohn Co.

The fourth session will be Tuesday Oct. 29, with William L. Miller, Ph.D. of The Upjohn Co. His subject is "Insulin and Oral Agents."

Session five will be Tuesday, Nov. 12. "Hormonally Active Non-Endocrine Tumors" is the subject for Lawrence Power, M.D., WSU.

"Newer Aspects of Reproductive Physiology" will be the subject for Earl Plunkett, M.D., U. Western Ontario", on Tuesday Nov. 26.

The final session, Tuesday Dec. 10, will be "The Pill and Its Problems" by S. J. Behrman, M.D., U. of M.

NAMED AT SAGINAW

Robert Clowater, M.D., has become the medical superintendent of the Saginaw County Hospital, succeeding retiring superintendent V. K. Volk, M.D. Doctor Clowater was succeeded in his former position as medical superintendent of Muskegon Northshore Hospital by W. Leonard Howard, M.D.

Michigan Men Hear Ideas at PR Seminar

Medicine today faces the task of relating medicine to matters of public concerns, declared AMA President Dwight L. Wilbur, M.D., at the 1968 AMA Public Relations Institute, attended by MSMS leaders in Chicago late in August.

MSMS President B. M. Harris, M.D., MSMS PR Chairman Brock E. Brush, M.D., and Scientific Editor John W. Moses, M.D., led the Michigan physicians and MSMS staff members at the workshop.

Many of the current MSMS projects were displayed in the exhibit room of tested public relations ideas.

In discussing advances in medical sciences and growing government involvement in health care, AMA President Wilbur suggested that the medical profession must focus attention on quality of care and also should become more concerned about the delivery of such care.

There were many speakers — and some urged county medical societies to re-evaluate their functions. It was suggested that county societies "must pause to see where we have been, where we are today, and where we go from here."

MARMP HELPS BEGIN DRUG INFO CENTER

A Drug Information Center has been established at the University of Michigan under a grant from the Michigan Association for Regional Medical Programs, Inc., to act as a rapid, random access, service function to the medical professions of the State. Its goal is to help bridge the gap between the medical professions and the estimated 200,000 articles of medical interest published per year.

MSMS Delegates & Alternates For 1968 MSMS House of Delegates

OFFICERS

Speaker:
James B. Blodgett, M.D., 76 W. Adams, Detroit 48226

Vice Speaker:
Vernon V. Bass, M.D., 3322 Davenport, Saginaw 48602

Immediate Past President:
C. Allen Payne, M.D., 1840 Wealthy Street, Grand Rapids 49506

Secretary:
Kenneth H. Johnson, M.D., 1116 Michigan National Tower, Lansing 48933

ALLEGAN

Extract of MSMS Council Minutes

Meeting of July 18-19, 1968

The Council received a report from the Chairman of the Michigan Delegation to the American Medical Association, Luther R. Leader, M.D.

A final report of the Ad Hoc Committee to Study MSMS Relationships with Blue Shield was adopted by The Council and the supplementary comments and suggestions were referred to an appropriate standing committee for study and report. In brief, the Committee recommended that the relationships between Blue Shield and MSMS be continued and communications improved.

CONTINUING PAST POLICY, The Council authorized the inviting of osteopaths to attend the MSMS Annual Scientific Session upon recommendation of component medical societies. The Council enlarged this policy so that all non-member practicing physicians may be invited to the scientific meetings with no registration fee.

The Council authorized MSMS representatives to attend the AMA Annual Communications Institute and Conference of County Medical Society Officers in Chicago and the Second National Congress on Medical Ethics.

Horizons Unlimited

MSMS members may obtain copies of the AMA "Horizons Unlimited" career handbook with an eight-page Michigan insert by writing to MSMS, P.O. Box 152, East Lansing 48823.

The Council appointed Norman D. Henderson, M.D., as the MSMS representative to an advisory board of study American Medical Association-University of Michigan chapter. The Council also presented to the Director of Michigan Department of Public Health nominations for the Laboratory Facilities Council.

Speaker James B. Blodgett, M.D., reported to The Council that the Committee on Procedures, of the House, had two major recommendations that introduction of resolutions should be permitted at the first and second meetings of the House only, except by consent of 2/3rds of the Delegates and that the President should be installed at a dinner meeting at the House on Tuesday evening. The remainder of the 61 responses were referred to a committee for study.

THE COUNCIL APPROVED Finance Committee amendments to the MSMS budget reflecting an anticipated increase in income and an anticipated decrease in annual expense, thus increasing the sum available for principle and interest payments by some $13,000.

Regarding the Beaumont Memorial, the Council requested the Beaumont Committee to clarify the legal, financial and moral responsibility that MSMS has to the Beaumont Memorial.

The Council reviewed annual summaries of committee activities which will be presented to the House of Delegates, approved the preliminary report of the Council to the House of Delegates, and reviewed minutes of committees which had met since June 5, 1968.

THE COUNCIL MET WITH representatives of the following groups and organizations: Michigan Department of Social Services; Michigan Health Council; MSMS Judicial Commission; Michigan Hospital Association; and Michigan Medical Service.

The Council received a report from insurance counsel on company representatives re malpractice insurance and referred this to the Professional Insurance Committee for study and report.

Meeting of June 5, 1968

AMA-ERF checks were presented to representatives of the Michigan medical schools by President Harris and Chairman Mason. The American Medical Association-Education and Research Foundation Checks went to Wayne State University Medical School ($6,911), University of Michigan Medical School ($12,203), and Michigan State University College of Human Medicine ($1,317).

The Council received a report from Treasurer John R. Ylvisaker explaining the format of operations for the Board of Managers (which is responsible for the new asset management plan) and reported that the Board had created, as authorized by The Council, a capital reserve account.

THE REPORT FROM Michigan Medical Service was presented by Lewis F. Hayes, M.D., Vice-President, concerning Medicaid experience over a 12 month period, information on analysis of claims experience, variable fee program status and Title XIX underwriting.

In anticipation of future problems, The Council decided to study the desirability of MSMS involvement in contract negotiation and created, therefore, an ad hoc study commission on negotiating contracts for medical services.

The Council authorized MSMS representatives to attend the National Conference on Rural Health sponsored by the AMA, the AMA Congress on Environmental Health Problems, and the AMA Regional Legislative Conference in Chicago.

The Council also authorized distribution of special reports about other state medical society annual meetings to The Council, Delegates and Alternate Delegates to the AMA and MSMS Delegates.

For Your Library

Copies of "A Century of Service in Medicine," published as a Centennial highlight by MSMS, are still available for cost, $2.00. The book, bound handsomely in blue, was written by Wm. J. Stapleton, Jr., M.D., of Detroit, the MSMS Historian. To obtain a copy, write to MSMS, 120 West Saginaw, East Lansing, and enclose a check.

Oscar D. Stryker, M.D., was appointed MSMS representative for planning a workshop on smoking and related disease to be conducted by the Michigan Academy of General Practice in October.

APPROVAL WAS GIVEN to continued MSMS cooperation in the automotive crash injury research program of the Cornell Laboratory, which is continuing its study to evaluate recent automotive design modifications in Michigan.

A. C. Stander, M.D., Saginaw, was appointed as The Council representative to the Michigan Hospital Association convention.

The Council directed that MSMS prepare a response to the proposed actions of the Michigan Community Health Services Study.

The Council favorably approved a request from the American Public Health Association for financial support of its meeting to be held in Detroit. A modest sum was appropriated.

Upon recommendation of the Finance Committee, The Council also approved a grant to finance an education project for the Michigan State Medical Assistants Society.

The Council reviewed the minutes of the many committees of MSMS which had held meetings since the last meeting of The Council.

REGARDING PROFESSIONAL liability insurance, because of rapid developments in this area, The Council requested to the MSMS insurance advisor to prepare a complete report on professional liability insurance prospects and possible advantages of group-sponsored plans with specific recommendations for Council consideration in July.

MD Placement Notice

—Looking for a smaller town that needs and wants a physician?

—Do you need an associate or assistant in your practice?

—Are there towns in your area in need of additional physicians?

COMING EVENTS

ASIM President To Address Michigan Internists at Gaylord

The Michigan Society of Internal Medicine will hold its annual meeting in conjunction with the American College of Physicians Regional Meeting at Hidden Valley (Otsego Ski Club) Gaylord, September 19 and 20.

On Thursday evening, September 19, R. Gerald Rice, M.D., Director of the Michigan Department of Health will speak on "Comprehensive Health Plannings," and Larry H. Birch, M.D., Director, Regional Medical Programs, University of Michigan Medical Center, Ann Arbor, will discuss "Regional Medical Programs—Past, Present, and Future."

Robert S. Long, M.D., of Omaha, President of the American Society of Internal Medicine, will be featured at the noon luncheon meeting, Friday, September 20. His topic will be "The Efficient Internist."

Arthur W. Strom, M.D., Hillsdale, will be installed as president of the Michigan Society of Internal Medicine, succeeding John R. Caldwell, M.D., Detroit. ☐

Heart Transplant Surgeon To Offer '69 Beaumont Talk

The surgeon who has performed the highest number of heart transplant operations in the world, Denton A. Cooley, M.D., from the Baylor University College of Medicine at the Texas Medical Center in Houston, will deliver the 1969 Beaumont Lecture at the Wayne County Medical Society Building. Doctor Cooley has proformed four human heart transplants.

"The subject of Doctor Cooley's lecture, 'Transplantation of the Human Heart,' says Conrad R. Lam, M.D., chairman of the Beaumont Lecture Committee, "is certainly the most current in the interest of everyone, and its place in the list of Beaumont lectures will add another important milestone in the history of medicine as recorded in the chronology of the lectures."

The lecture is scheduled for Monday, April 7, 1969. ☐

Better Hearing, Speech Convention to Follow MSMS Annual Session

Neonate testing and early rehabilitation of hearing impaired children will be the central theme when Michigan Association for Better Hearing and Speech holds its two-day fall convention at the Pick-Fort Shelby Hotel, Detroit.

Marion P. Downs, a clinical audiologist, who has developed a program of newborn hospital testing, will give the keynote address Friday morning, September 27, at 9:30. Miss Downs, director of clinical audiology at the University of Colorado Medical Center, Denver, has lectured and written extensively on her program which is now used routinely in nine Denver hospitals.

Chairman of the Friday program, planned to be of special interest to doctors, is Royal C. Hayden, Jr., M.D., Detroit area otologist and director of the Henry Ford Hospital Otological Research Laboratory.

G. Fred Moench, M.D., director of the Midland City-County Health Department, is MABHS president. ☐

MEDISCENE

Sept. 4-5 — Conference for Physicians and Nurses, St. Mary's Lake
Sept. 22-23-24 — MSMS House of Delegates, Sheraton-Cadillac Hotel, Detroit
Sept. 24-26 — Woman's Auxiliary to the MSMS, Annual Convention, Statler-Hilton Hotel, Detroit
Sept. 24-26 — MSMAS Annual Session, Pontchartrain Hotel, Detroit
Sept. 25-26 — MSMS Annual Scientific Session, Sheraton-Cadillac Hotel, Detroit
Oct. 9 — Family Life Education Workshop, MSMS Headquarters, East Lansing
Oct. 11-12-13 — University of Michigan Medical Center Alumni Conference, Ann Arbor
Oct. 20-26 — National Community Health Week
Oct. 23-24 — Michigan Tuberculosis and Respiratory Disease Association Annual Meeting, Hayes Motor Hotel, Jackson
Oct. 24 — Michigan Thoracic Society Annual Meeting, Hayes Motor Hotel, Jackson
Oct. 30-31 — Symposium on Neuroendocrinology of Human Reproduction, McGregor Conference Center, Wayne State University
Nov. 6 — The Council, MSMS Headquarters, East Lansing
Nov. 10 — MSMAS Officers' Workshop, Port Huron Motor Inn, Port Huron
Nov. 11-15 — American Public Health Association Annual Conference, Cobo Hall, Detroit
Dec. 1-4 — AMA Clinical Convention, Miami
Dec. 18 — The Council, MSMS Headquarters, East Lansing ☐

To Cos Add "t" from Trouble And It Spells Cost . . .

BY WILLIAM S. McNARY, PRESIDENT
MICHIGAN HOSPITAL SERVICE

Cos is where it all started.

And who knows where it will end.

Cos is a ragged, little Greek island of about 20,000 souls. Not far from the southwestern corner of Asia Minor, the island is the second largest of the Dodecanese, a lovely word to say, in any language.

Hipprocrates, the "father of medicine," was born on Cos about 460 B.C. And it was on Cos that he established the first medical school and the first hospital, as we think of them.

The local folk tell tourists that Hippocrates, the school and the hospital all thrived in the shade of a beautiful plane tree, whose truck now measures 30 feet around and whose immense, gnarled branches must be supported by pillars.

From these beginnings, many wonders have been wrought, as we all know, by what we now call our health care system.

SUCH WONDERS INDEED!

With heart transplants, our physicians — not our philosophers nor our religious leaders — have brought us face-to-face with the stark demanding questions of, "What is life?" and "Who shall have it?" These questions must be answered, and very soon.

Because of the growth of this health care system that benefits us all, we now are in such serious difficulty on the cost question that it is of great national concern. Perhaps health care costs don't rank with racial problems, inflation, poverty, big city crime and foreign involvements, but they're well up the list and have been climbing like a rocket for two decades.

What might be the principal root of this problem that faces all of us has been explained by D. Eugene Sibery, executive director of the Greater Detroit Area Hospital Council. Gene says:

"There is considerable cogency to the charge that we, in fact, do not have a health care system, if by system we mean an orderly arrangement which assures proper interrelationship and coordination between the various components."

The costs racked up by this sprawling health care industry rank as the nation's third largest category of spending (behind food and construction). Worse, it's rising at about twice the rate of the cost-of-living.

THERE CAN BE LITTLE DOUBT that costs cannot continue to climb in this fashion. If permitted to do so, we would be spending, sooner than you think, all of our gross national product on our health. Of course, this cannot and will not be permitted.

A fierce furor already exists about health care costs. Those of us who work in this field have been nervously aware of this for years. The concern now is being expressed everywhere. It's a frequent subject for popular journals. It's a hot topic of common conversation. It draws continual comment from government spokesmen.

At the conslusion of the National Conference on Medical Costs last year in Washington, a most astute and plain-spoken man, John W. Gardner, then Secretary of Health, Education and Welfare, said of our health care system:

"We cannot go on as we have in the past. New patterns will be necessary. Those who entertain some apprehension as to what the new patterns will be, had better plunge in and experiment with their own preferred solution."

Mr. Gardner added something very important: "The aspirations of the American people for health care are apparently without ceiling . . . these vaulting aspirations pose serious problems for those whose task is to achieve the goals. Aspira-

This article, which appeals for "state and local planning to create a voluntary health care system to replace our present uncoordinated, basically inefficient conglomeration of good, fair and poor health care facilities" appeared in the recent Annual Report of Michigan Hospital Service. It is reprinted with the permission of Mr. McNary and MHS. Appreciation is voiced for the use of the illustrations.

tions run into the hard reality of resource constraints."

In a November letter to Gardner, AFL-CIO Pres. George Meany talked even tougher and harder.

MEANY URGED IMMEDIATE, effective controls on doctors' fees. "There is no excuse whatsoever," he said, "for this relentless escalation in physicians' fees, especially those charged under the Medicare program."

Whether his fact base is sound or shaky, a man of Meany's stature and influence does not make such startling proposals without having in his mind a clear intent that could carry the day much sooner than those enraged by his statement may believe possible.

In an interview with the magazine *Medical Economics,* Jerome B. Pollack, professor of the economics of medicine at Harvard and a former Michigan Blue Shield director, said:

"Inevitably, government will play a larger role in achieving a better health system . . .

" . . . The government is in medicine because the public wants it there, and if doctors continue to fight government at every point — even in those areas where government has legitimate interest, such as the welfare of the people — then Washington is just going to take over the whole thing.

"That happened in England and it can happen here. That's what doctors really have to fear."

I THINK JERRY IS wrong about the extent to which the public wants government in medicine.

But if these voices are too political, too shrill, too liberal for you, try this!

Good Housekeeping magazine surveyed 1,000 American women on the way their health care needs are being met. Although the survey asked only for their views on costs, the magazine — which is not given to sensationalism — concluded:

"It (the survey) clearly touched a raw nerve. For women everywhere spontaneously poured out their wide-ranging complaints.

"Whether they singled out excessive dental charges, exorbitant eyeglass costs, soaring hospital bills, incredible surgeons' fees, budget-wrecking prescription costs, welfare chiseling, insurance deficiencies, Medicare failings, callousness of specialists, laziness of hospital personnel or encroachment of socialism into the medical field, (they) revealed an almost bottomless well of discontent."

Because of the discontent, some dractic things have been happening in the field of health care.

For instance, Michigan Blue Cross has had to defend its Hospital Qualifications Program in a legal battle that carried to the State Supreme Court.

TOO FREQUENTLY, WHILE unquestionably acting completely in the public interest, we've been accused of being a monster, of inhibiting free enterprise or of acting dictatorially.

The ogre most frequently used to threaten those who oppose even minor experiments bearing on the cost question is GOVERNMENT MEDICINE.

It's a tired and tattered old scarecrow.

And it's worthless.

It's not that I'm against government. It's just that I don't believe the government can provide a satisfactory solution to this complicated problem.

Medicare and Medicaid in our country and the dractic approaches used by other nations prove that shifting the financing mechanism to another location or jurisdiction means absolutely nothing in terms of effective cost control.

Last November, in the report of the Federal government's National Advisory Commission on Health Manpower, it was concluded (and placed in italics for emphasis):

"Government alone is not big enough to solve the problems of health care for the American people."

EVEN MORE RECENTLY, the Gorham Report (HEW's Report to the President on Medical Care Prices) said:

"The Federal government . . . cannot make a major impact on the efficiency of medical care delivery without the cooperation of the medical profession, the hospital industry, insurance carriers, State and local governments and many other public and private groups."

In such a complicated and emotionally-charged field as health care, the problem has many, many facets. I could, for instance, provoke each of you to argue with some heat and personal application about such statements as:

- There are too many hospital beds . . . and you will cite the recent time when you or someone you know had to wait a week or two to get such a bed.

- Drug research and production are expensive . . . but you want the latest and absolutely best medicine when you need it — and you seem to need a lot.

- Nurses salaries are too low . . . and you'll relate how service was poor and the nurse never was there when you wanted her.

- There are too many small, inefficient hospitals . . . but you don't want to drive even 10 miles twice a week for your mother's radiation therapy — so you fight to save "our hospital" down the street.

- There are not enough doctors . . . but they make too much money, except for your personal physician, who is a fine man, terribly overworked, to whom you say frantically, "Save my daughter; I'll pay anything."

RATHER THAN ARGUE these points (which are, by the way, very pertinent), could I ask you to reflect instead on two relatively simple questions?

The first was suggested by my friend, J. Douglas Colman, president of the New York City Blue Cross Plan.

"It is clinically impossible," he said, "to insulate an individual from the cumulative effects of his own neglect or self-indulgence. Citizens must accept the responsibility to minimize the need for health care."

The truly intriguing question that resulted from dwelling on his comments is:

Can the American individual, through his or her own education and effort, affect the kind of personal control of his demands for health care that will make unnecessary the massive, forced cost controls he seems to be demanding?

Interesting!

Despite the amazing accomplishment of the American people in individually improving their health, the answer probably is, "No." The evidence supports John Gardner's comment that "the aspirations of the American people for health care are apparently without ceiling."

But I'm not so sure.

Perhaps in 10 or 15 years, the current explosion in higher education will produce changes we will find almost unbelievable.

AS WE PROGRESS, can we not expect — with advances in individual health care and with vastly-improved applications of environmental health and preventive medicine, both of which are now beginning to get the emphasis they deserve — some relief in the cost of the treatment of illness?

This is not a fascinating possibility. It's a fascinating probability.

I really do hope that, through education, people will improve their environment and benefit so greatly from preventive medicine that their need for expensive treatment due to sickness or injury will plummet.

We now think of the health care system as providing for people only when they are ill or injured. In many, many instances, this is a "lock the barn door" proposition.

Environmental health and preventime medicine, too long outside the fold of the health care industry, are complicated. They embrace much not now considered a concern of our hospitals and doctors (who have enough to do just treating the sick and injured).

I refer to air and water pollution, mental stress, personal health habits, sanitation in the home, diet and — most of all — education in all such subjects.

But, as responsible realists with a most pressing problem, we must view this happy tomorrow only as an eventual safeguard against our immediate dilemma.

In the meantime, if the answer to the above question really is negative, and if we agree that health care costs cannot continue to increase at the current rate or anything near it, the next question is a tough and disagreeable one.

Who will apply the control, backed by force, required to reduce the increases in the cost of health care to an acceptable level — and how will it be done?

Those in the health care field have worked mightly on cost control. More and more is being done every day. I could fill pages just briefly mentioning these efforts. The box below lists only a few:

- Health facility planning
- Progressive patient care
- Coordinated home care
- Group institutional purchasing
- Eliminating duplication of expensive equipment in neighboring facilities
- Closing of outmoded facilities
- Merging of several small hospitals into a single modern service center
- Shared services, i.e., laundry, X-ray, blood banks, computer services, etc.
- More use of modern management techniques from industry and business
- Better division of labor to reduce routine work by trained specialists
- Greater fee standardization by physicians
- More group practice in its various forms
- Multiphasic screening of patients
- Preadmission testing to reduce lengths of stay in hospitals
- Health education and counseling
- Cost and quality control in hospitals
- Reduction in benefit duplication by prepayment plans and insurance firms
- Incentive payment plans for hospitals and hospital employees
- Flat negotiated fees to hospitals or doctors
- Intensive review and audit of services and costs

Believe it or not, there are large and influential groups of individuals — most of them fine people — staunchly opposed to and working actively against most of the proposals in this list.

And there is widespread public understanding of and support for almost none of them.

LET ME COMMENT BRIEFLY on just the first item — health facilities planning.

Michigan Blue Cross supports health facilities planning through its Hospital Qualifications Program, which I mentioned earlier. It's one of the most potent weapons in our cost control armamentarium to conserve the dollars of our 4½ million members.

The highly-regarded findings of the National Commission on Community Health Services — commonly known as the Folsom Report — said in 1966:

"The rapid rise in the cost of hospital care . . . is a matter of grave concern . . . The Commission takes the position that further increases . . . must not be accepted complacently."

One of its recommendations on cost was:

"Regional health-planning councils should be responsible for initiating and coordinating health facility planning for the region."

Yet, in the next year, the equally-prestigious National Advisory Commission on Health Manpower, said in what is now known as the Miller Report:

"Although there is considerable evidence to support this belief, we are skeptical of the value of giving planning agencies the authority and responsibility to approve or disapprove individual hospital projects . . . We doubt that planning councils will have sufficient objectivity and wisdom to make decisions always in the best interests of the entire community . . ."

Such a divergence of opinion among two groups of top-level national leaders, who studied at great length and presumably had available to them the same information, is difficult to comprehend.

THE QUESTION REMAINS on the table. Who is to control cost and how?

This is not a bitter lament, like those so popular these days with men who wish to appear learned and profound, but who end with a challenge, "It's up to you to do something or the government will."

It should be pointed out that the resolution of the real conflict in this situation rests with the American public.

Walter E. Landgraf, writing for the September-October issue of the *Harvard Business Review,* put it a bit stiffer. Executive Director of the Allegheny General Hospital in Pittsburgh, Landgraf says:

"Public attention has mainly been focused on voluntary nonprofit hospitals . . . But the problem of rising costs and financial health services is not the sole property of the voluntary hospital; it is also the problem of society."

At the present time, everyone wants unlimited medical care — the best, the newest, the most. It has become a "human right" with almost constitutional status. But the fast-rising costs are creating a squeeze on other needs.

I'm sure we all realize — or should — that when costs are controlled, quality may be jeopardized.

Health care may have become an American right, but where such rights are guaranteed, whether by government or anybody else, the guarantee almost always assures only the minimum.

Cutting costs is not difficult.

As Harper Hospital Board Chairman Ray Eppert said in the January issue of *Hospitals* magazine:

"We could cut costs tomorrow just by arbitrarily reducing the quality of the product — that which goes on with the patient while he is in the hospital. We could also reduce our teaching and research. Instead of moving forward, we could stagnate. But our goal . . ."

In my opinion, the really intelligent approach is to agree not just on how to control costs, BUT ALSO on how to do it in a sound manner that will assure the highest quality of care possible.

Not easy!

Really worthwhile endeavors rarely are.

THAT'S WHY I HAVE but three observations, the most important one having to do with the public — which must make the important decisions.

All segments of the health care industry must work continually and at a much greater rate of speed to produce effective cost controls, while at the same time holding firmly to the highest possible quality standards.

This proposal, which encompasses the many, many suggestions in the voluminous studies made of every single part of the health care industry by public and private organizations, is the responsibility of health care experts.

It will call for far more cooperation and agreement than we've had in the past. The system is riddled with very serious conflicts . . . from the seemingly-praiseworthy desire of an individual, organization or community to establish a hospital where none is neded . . . to the unnecessary bickering that goes on between nurses' organizations about the shortage of nurses . . . to the suspicion with which profit-making nursing homes regard those who hold that profit should not be a prime motivation in the treatment of sick people . . . to the condemnation by too many physicians of everything but the traditional solo practice.

The list of expensive conflicts is long.

We must make continuing and greater efforts to resolve them.

The public must become more aware of its true interest — which is to obtain a workable balance between quality health care and a cost that is bearable.

Too long now, the problem has been in the hands of health care professionals, who cannot always shed their bias and who operate in an area where true competition has virtually ceased to exist.

We should stop expecting the rabbits to take care of the cabbage patch.

Health care professionals must be more willing, through free discussion and informational programs, to help the public understand the basic issues.

And the public must be listened to.

The current public attitude reflected in literature and in public and private studies is largely hostile criticism.

THE HOSTILITY HAS great potential. Because it expresses interest, it may bring public knowledge and understanding. This, in turn, may bring support for the cost-control mechanisms created by the health care industry, help resolve conflicts and answer questions those in the health industry cannot.

Much has been said of the value of an informed public. The American public's world-wide reputation for self-expression and determination is rapidly bringing itself to bear on health care costs.

We should apply our efforts through state and local planning to create a voluntary health care system to replace our present uncoordinated, basically inefficient conglomeration of good, fair and poor health care facilities.

The planning that has been done to date in many urban centers points the way. With much greater emphasis on the education of the public and of our state and local officials, there is no reason why we cannot keep voluntaryism in the saddle.

The people want good medicine, efficient institutions and reasonable prices.

ALL THINGS CONSIDERED, there is no reason why they cannot get these things from our voluntary health care system — to at least the same degree that industry provides its material blessings.

It is our collective job to make sure they do.

Blue Cross is ready, able and willing to help.

If the health care industry performs, as in my first suggestion, and if the public understands, as in the second, and if truly public groups can establish sound patterns with reasonable economic limits, then we can hope to avoid repeating our own errors — and those of others.

ACTIVITIES, PROJECTS

UNETHICAL TO USE PRESCRIPTION BLANKS WITH Rx IMPRINT

The ethic of physicians using prescription blanks with the name of a pharmacy printed thereon has been considered by the MSMS Judicial Commission. Donald N. Sweeny, Jr., M.D., Chairman, MSMS Judicial Commission, reports the Commission gave this matter careful study.

Under the authority invested in the Commission in Chapter 11 Section 8 (b) (Authority to make ethical interpretations and decisions in accordance with the standards of the American Medical Association.) of the MSMS Bylaws, have reaffirmed the 1964 opinion of the Judicial Council of the American Medical Association as follows:

> **It is unethical for physicians to use prescription blanks with the name of a pharmacy printed thereon**

To insure that there be no misunderstanding on this matter by pharmacists, the Michigan State Pharmaceutical Association has been informed of the action and requested to make it known to pharmacists throughout the state. ☐

CANCER FOUNDATION ADDS MAN

Frank Jakes, Ph.D., formerly of Ford Motor, has been appointed by the Michigan Cancer Foundation, as executive vice president for community affairs. He will be responsible for development and coordination of educational, promotional and community service programs as well as other executive type assignments.

Doctor Jakes has been with Ford for 10 years as a training specialist in the industrial relations department, and with WSU. ☐

WIVES RATE PLAUDITS

Wives of two Michigan doctors have achieved notable "firsts." Mrs. William Fishbeck, Traverse City, elected to a four-year term on the City Commission of Traverse City, will be the Commission's first woman member. Mrs. Thomas J. Mudge, Marquette, has been appointed to the eight-member Michigan Mental Health Advisory Council, the Council's first member from the Upper Peninsula. ☐

SEES KIDNEY MACHINES IN HOMES WITH DOCTORS GIVING FOLLOW-UP CARE

Joseph W. Eschbach, Jr., M.D., University of Washington, told the Seventh Annual Michigan Kidney Foundation Disease Symposium May 24 and 25 in Grand Rapids that patients with kidney failure must be cared for at home with the patient's local physician providing "astute follow-up care."

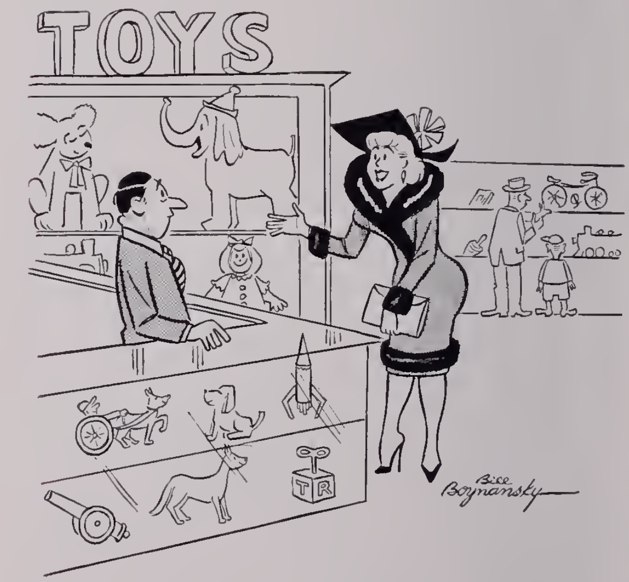
The follow-up, he said, will include office calls every one to four months and monthly blood tests.

The experience at the University of Washington Center, he said, has been that most local physicians are happy to take over care of patients after they are released. Many physicians have visited the center for instruction. He recommended eight to ten hours of dialysis three times weekly. ☐

A Social Imperative

"Sweeping societal change now dictates a reappraisal of this earlier philosophy which placed nearly its total investment in the education of the child. The impact of automation, the accelerated obsolescence of knowledge, increasing longevity, and the shrinkage of the world are all factors which now render the continuing education of the adult a social imperative."

— Edwin L. Novak, President
Michigan State Board of Education



"Where can I buy some of these mental blocks you hear so much about?"

Utilization Review Systems; Characteristics and Operation

ABSTRACT: The concept of a utilization review system is developed along the lines of a closed, (continuous) self-corrective process which brings together the basic components of medical care in a manner which allows qualitative and quantitative statements to be made about medical care. The basic components of the utilization review system are then described and contrasted with examples from operational systems.

BY CARL JOSEPHSON, DIRECTOR
UTILIZATION REVIEW RESEARCH PROJECT
MICHIGAN BLUE SHIELD

In two previous articles in this series, a number of forces in our society were shown to exert pressure on the medical care system to achieve the "best medical care for the most people at the lowest cost."

One method of both encouraging and measuring the progress toward this goal is through an effective utilization review system. The system, however, to be effective must be closed and self-corrective. That is, the review process must encompass all of the components of medical care — it must describe the medical goals of the community in quantifiable terms; it must evaluate the patient care that is being rendered, third-party payers, and socio-medical factors in the patient-doctor relationship. The system should be self-corrective in the sense that information gained from the review process is fed back into the medical system in a constructive manner. Utilization review committee reports, journal publications of changing patterns of medical care, and revised course curriculums are some of the continuing educational by-products of the utilization review system.

THE TRADITIONAL HOSPITAL-based utilization review system is organized around a review committee of staff physicians who look at preselected cases with the intent of evaluating the patient care and, where indicated, informing the attending physician of its findings. When the internal structure of the utilization review committee is analyzed and the many possible variations which can occur are enumerated, as illustrated in Chart I, the complexity of the problem is readily apparent.[1]

The purpose of the task is to maximize the effectiveness of the utilization review committee by the optimum allocation of available medical personnel to solve each hospital's particular utilization problems. As with the structure of the utilization committees, the actual review process contains a number of significant variations within the basic components. Some of these variations are shown in Chart II.

The time when a case is selected for review (i.e. type of review) is an important factor to consider in establishing a utilization review system since it influences the choice of other component variations. For example, the choice of concurrent review may be taken at the time of admission or at some stage during the inpatient stay. While this method can be used to effect the patient's continuing care (i.e. concentrate on "deviant" cases while they are in the hospital), it cannot evaluate the total medical care. Another type of review is the retrospective study which reviews the medical records of discharged patients. Retrospective re-

This is the third in the series of articles dealing with Utilization Review prepared by the staff of Michigan Blue Shield.

The author, Carl Josephson, is the director of the Utilization Review Research Project. He has had several years of experience in working on research projects for Blue Cross and Blue Shield plans ranging from the two national organizations in Chicago, Blue Cross Association and National Association of Blue Shield Plans to local plans in Michigan, Indiana and California.

—Louis F. Hayes, M.D.
Vice President, Medical Affairs
Michigan Blue Shield

view studies may sample all types of patient categories and review many components of patient care simultaneously. The manner of selection of cases for review ranges from complex models based on probability sampling of selected characteristics from the patient population, such as payment status, diagnostic category, and length of stay, to the review of an entire discharged patient population.

Retrospective studies employing computer techniques can secure data about patterns of patient care while performing the selection of cases. Many of the larger hospitals and hospital-based service bureaus are developing computerized screens to assist in the selection and initial evaluation of patients' records. Whenever the computer is employed to assist in the selection of cases or the evaluation of patient care, it is necessary to develop normative patterns of patient care and/or predetermined medical criteria as an index or baseline comparison. This is in contrast to the reviewer who relies on his own professional judgment on an *ad hoc* basis.

WITH SO MANY POSSIBLE variations in the components of a utilization review system, it is understandable that many different operational systems have evolved. The Monroe County study

Chart I
Utilization Review Committee Structure*

COMMITTEE COMPOSITION AND ORGANIZATION	VARIATIONS
Size	Numeric and variable
Membership	Physicians; administration; medical record librarian; social service; nursing; community members; health officers; etc.
Selection of Members and Officers	Elected or appointed by Medical Staff, Executive Committee, Utilization Committee, or Administration because of staff membership, position on medical staff, interest, or specialty
Term of Office	Rotation; non-rotating; some permanent members
Assignment of Cases	Full committee compliment, sub-committee units, or individual physician's review of all cases, cases by type of service, cases at random, or cases at specified time intervals
Frequency of Meetings, and Individual Review	At specified time intervals: daily, weekly, monthly, etc.; as needed
Responsibility of Members	Review of cases; formulation of policy of committee; formulation of standards for individual review
Relationship to Other Committees	Overlapping membership; informal discussions; subcommittee of other staff committee; no relationship

* Adapted from Greaney, Morisse, and Wilson, "A Study of Utilization Review Mechanisms Employed in Connecticut Hospitals," May, 1967; unpublished masters thesis, Yale University School of Medicine.

Chart II
Essential Components to the Utilization Review Process*

COMPONENTS	VARIATIONS
Type of Review	At time of admission; concurrent; retrospective
Case Selection	Total patient population; diagnostic categories; deviant cases; either all or on a sampling basis
Components of Patient Care Reviewed	Necessity of admission; length of stay; delays in diagnostic and therapeutic procedures; delays in consultation; quality of care received
Data Sources	Insurance records; medical record (full record, abstract, face sheet, check list); physician interview; patient observations
Method of Evaluation	Ad hoc peer judgment (individual or group basis); predetermined medical criteria

* Ibid

and the Nassau County pilot study, for example, were developed to test two systems of utilization review. While both systems used retrospective review by individual reviewers, the former relied on *ad hoc* professional judgment and the latter on informal, but flexible, predetermined criteria. Variations between different reviewers as well as variations between the same reviewers at different time intervals were found to be less pronounced where the use of predetermined criteria was followed.

Under the New Jersey A.I.D. system (Approval by Individual Diagnosis), a concurrent review system using certification techniques was developed with the assistance of three outside agencies — New Jersey Medical Service, New Jersey Hospital Association, and the Blue Cross-Blue Shield Plans. Each patient upon admission is given an estimated length-of-stay according to the admission diagnosis. Should the patient's stay extend beyond this estimate, a form indicating the necessity for continuing care must be completed by the patient's physician. Copies of this certification form are attached to the patient's chart and sent to the hospital utilization review committee.

IN CONTRAST TO individual case review methods, the HUP (Hospital Utilization Project) has developed a patterns review technique whereby electronic data processing methods are used to obtain data from all hospital discharges. Specific diagnostic groups are analyzed so that inter- and intra-hospital comparisons can be made on patterns of patient care. HUP is sponsored by the local medical societies and Blue Cross Plan of western Pennsylvania. Each hospital completes an abstract form from the medical record of all discharge cases. These abstracts are coded and compiled into a case listing for use by the hospital as a screening device. HUP in addition prepares a series of comparative statistics and special reports which highlight significant variations in patterns of care that would justify the attention of a hospital utilization review committee.

As with all of the systems described so far, individual case review is still performed within the hospital; however, the emphasis is placed on reviewing patterns of normal care rather than deviant use. HUP provides technical consultation to assist the local hospitals in their interpretation and use of their reports.

The Professional Activities Study (PAS) began in 1950 as an experiment in centralized collecting and processing of data on hospital medical care. It began with a few hospitals in Michigan and expanded to include hospitals throughout the United States, Puerto Rico, Canada, and New Zealand. PAS is similar to the HUP system in that it uses case abstracts for data collection and prepares case listings and monthly comparative statistical reports and summaries. The case abstracts, however, are more detailed as are the statistical reports. When interpreted correctly, the reports can be used for retrospective review of admissions, duration of stay, evaluation of professional services furnished, and the appropriate use of hospital facilities and services.

THE EXISTING UTILIZATION review systems are developed mostly for use by hospital staffs. As such, they tend to concentrate on individual case review techniques and are seldom used for evaluating the patterns of medical care being rendered in the community. The growth of third-party prepayment systems financing a significant proportion of the health care dollar and insuring large population groups have precipatated evaluative studies of the efficiency and effectiveness of the organization and delivery of medical care. The accumulation and centralized processing of records by these health carriers have provided another dimension to the review system. Redefinitions of the units of measurement and changes in the emphasis from specific deviant cases to measurement of normative patterns of care will provide the necessary base-line statistics that can lead to comprehensive problem definitions and corrective programs. ☐

Staudacher Leaves Post As SAMA Executive

Russell F. Staudacher, MSMS staff member from 1949-51, retired June 30 after 18 years of service as the executive director of the Student American Medical Association. Mr. Staudacher, who suffered a heart attack last December, is serving as consultant to several associations.

Charles Hewitt, former attorney and administrative assistant for the American Academy of General Practice, will succeed Mr. Studacher. ☐

DIRECTORY AVAILABLE OF SERVICES TO AGING

The Michigan Commission on Aging has issued a new "Directory of Services" which may be of interest to some physicians. A copy is available from the Commission, 1101 S. Washington, Lansing 48913.

The Directory provides general information about programs and assistance available to older people, how to apply for such benefits as the Homestead Tax Exemption, and opportunities in employment, recreation and education. ☐

Is it depression?

He says "It's my stomach..."

...but his other symptoms:

functional somatic complaints, anxiety, insomnia, anorexia, feelings of guilt

strongly suggest

an underlying depression.

when the diagnosis is depression

ELAVIL® HCl

(AMITRIPTYLINE HCl | MSD)

Indications: Mental depression and mild anxiety accompanying depression.

Contraindications: Glaucoma and predisposition to urinary retention. Not recommended in pregnancy.

Precautions and Side Effects: Drowsiness may occur within the first few days of therapy. Patients should be warned against driving a car or operating machinery or appliances requiring alert attention. When depression is accompanied by anxiety or agitation too severe to be controlled by ELAVIL HCl alone, a phenothiazine tranquilizer may be given concomitantly. Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having varying modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Monoamine oxidase inhibitor drugs may potentiate other drugs and such potentiation may even cause death; permit at least two weeks to elapse between administration of two agents; in such patients, initiate therapy with ELAVIL HCl cautiously with gradual increase in dosage required to obtain a satisfactory response. Caution patients about errors of judgment due to change in mood, and that the response to alcohol may be potentiated. May provoke mania or hypomania in manic-depressive patients.

Side effects include drowsiness; dizziness; nausea; excitement; hypotension; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of schizophrenia which may require phenothiazine tranquilizer therapy; epileptiform seizures in chronic schizophrenics; temporary confusion, disturbed concentration or, rarely, transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of the mouth, blurring of vision, urinary retention, constipation; paralytic ileus; jaundice; agranulocytosis.

Careful observation of all patients is recommended. The antidepressant activity may be evident within 3 or 4 days or may take as long as 30 days to develop adequately, and lack of response sometimes occurs. Response to medication will vary according to severity as well as type of depression present. Elderly patients and adolescents can often be managed on lower dosage levels.

Supplied: Tablets ELAVIL HCl, containing 10 mg., 25 mg., and 50 mg. amitriptyline HCl, bottles of 100 and 1000; Injection ELAVIL HCl, in 10-cc. vials, containing per cc.: 10 mg. amitriptyline HCl, 44 mg. dextrose, 1.5 mg. methylparaben, and 0.2 mg. propylparaben.

WHERE TODAY'S THEORY IS TOMORROW'S THERAPY

Report on Michigan Regional Medical Program

BY DON MARSHALL, M.D., KALAMAZOO
REPRESENTATIVE OF MSMS TO MARMP
VICE PRES., BOARD OF DIRECTORS, MARMP

The Officers, Council and Delegates of the MSMS, as well as the general membership, should keep informed of the progress of the Heart, Cancer, Stroke Program in this state. They should consider and decide a number of questions regarding the program. They should aid in a study of medical needs in Michigan that might properly and advantageously be met by this program.

Considering first the program from the national aspect, there is little doubt that the RMP is here to stay for the foreseeable future. Congress is pleased with it so far, it is doing good, much initial skepticism is disappearing, and it is now firmly started in all states. The program is being administered as originally outlined, with initiative and approval for the start of each project resting locally in the region, rather than in Washington. The program also is stimulating and demanding cooperation at the local level in a manner never before achieved. These are the two outstanding features of the law and its implementation: a) Washington approves nothing not first approved by the local region, and b) Washington approves no regional plan or activity that cannot first demonstrate that all concerned local groups are participating and agree on it.

UP TO THIS TIME the RMP (PL89-239) and the Comprehensive Planning Act (PL89-749) are cooperating closely, but the latter is not preparing to swallow the former. They are not alike, though they overlap in spots.

The factor in RMP that is beginning to blur is the limitation to heart disease, cancer, stroke and related diseases. These are medically so all-encompassing that to survey or study or educate for these categorical diseases alone simultaneously prepares often for similar action for all medical ailments. There early was urging that the categorical limitations be removed, and it seems likely that the first major change in the law will be in that direction.

The basic purposes of the RMP will bear repeating: 1) To reduce the time lag between the discovery and effective application of new knowledge, in the field of medicine; 2) To improve the quality and effectiveness of medical care; 3) To bring together the diverse groups in the health care field, for more effective results and to improve patient care.

Already 1,000 medical institutions are in various ways participating in the RMP. This includes every medical school and hundreds of hospitals. Eight hundred health organizations are participating, including every State Medical Society, every state health department, every state heart association and cancer society. The RMP in the U.S. employs over 1,800 salaried employees, full or part time, and over 7,000 non-Federal-connected individuals are active in it. The first planning grant was made two years ago; now about 24 regions have received or are in process of getting operational grants.

THE STEPS COVERED in setting up a regional program could be outlined as follows: 1) involvement and commitment of the individuals and institutions concerned; 2) the identification of needs and opportunities; 3) an assessment of resources, both physical, personnel, and ability; 4) determination of objectives; 5) setting priorities; 6) implementation; 7) evaluation of results.

The AMA supports the RMP so long as it continues to be administered as it has been, to catalyze and to facilitate better programs to serve patients and their physicians. In 5 of the 54 regions a State medical society is the program grantee, or heads the regional program. These are Georgia, D.C., Nebraska, Minnesota and Pennsylvania. The AMA testified before Congress in March that "We feel that the program has been administered very well, and with restraint and good judgment."

Since November 1967 the Michigan Association for Regional Medical Programs has had a central executive office in East Lansing headed by Albert

AUTHOR

DOCTOR MARSHALL

E. Heustis, M.D. The Board of Directors meets monthly and the Regional Advisory Group every three months. There are several professional advisory groups and task forces. In the coming year it is expected that a few field men will be hired to facilitate communication in the various areas of the state. The program everywhere has started around medical schools, but from Congress on down there is a clear desire and effort promptly to involve the profession and hospitals in smaller and rural communities.

TO DATE THE MICHIGAN State Medical Society has been involved in MARMP as follows: 1) It has an official representative on The Board of Directors; 2) Many of the committees of the Society are watching the program (Cancer, Cardiac Disease Control, Postgraduate Education, Rehabilitation, Aging, Diabetes, Rural Medical Service, Education Liaison, Cancer Coordinating); 3) To inform the society of MARMP activities a) a meeting of the chairmen of the committees listed above was held in October 1967; b) two programs on MARMP were given at the Annual Meeting in September 1967; and c) a variety of articles and announcements have been published throughout the year in *Michigan Medicine*; 4) Most of the scores of individuals active in MARMP today are MD's, and nearly all members of MSMS.

Despite all this integration of MSMS into the MARM Program, the point deserves reconsideration on whether the present participation of MSMS is all that it should be, and in the most efficient form. Much of the skepticism with which the medical profession met this national program at its start has disappeared, and has been replaced with support and even enthusiasm. The program is now a fairly husky baby of two years, with quite a potential for good that MSMS should be well aware of. It would seem logical that specific activities of MSMS in the Michigan RMP should be initiated and monitored by our various committees. In addition, county medical societies and the medical staff of all hospitals should become informed of the program and the potential for participation and help. Lastly any group or individual with suggestions or requests should feel free to communicate directly with either MSMS or with Dr. Heustis at the MARMP office, 1111 Michigan Avenue, East Lansing. ☐

MAEDC ISSUES HANDBOOK RE EMOTIONALLY DISTURBED

The Michigan Association for Emotionally Disturbed Children (MAEDC) has recently published a handbook which lists all Michigan services which are currently available for the care of emotionally disturbed children.

"Professional and lay members of MAEDC repeatedly have pointed out that there are directories on residential care for children, hospital services, and directories on educational programs, but nowhere is there one comprehensive listing of all services for disturbed children in Michigan," says Samuel L. Davis, Executive Director of the Association.

To fill the gap, the Association has published "Finding Programs for Troubled Children." It will be of special interest not only to pediatricians and general practitioners, but all physicians who are called upon to make reference for the care of children.

To receive a copy free of charge write: MAEDC, 668 Pallister Avenue, Detroit 48202.

Members of MAEDC are professionals and interested citizens dedicated to promoting the welfare of emotionally disturbed children. MSMS members on the MAEDC board of directors are William D. Harrelson, M.D., of Kalamazoo, Edward H. Rodda, M.D., of Bay City, and G. Fred. Moench, M.D., M.P.H., of Midland. ☐

PLAINWELL SANITARIUM, INC.

Plainwell, Michigan — MU 5-8441

Edwin M. Williamson, M.D.
M. Leroy Barry, M.D.

Dan W. Everett, M.D.
Wilbur R. King, Ph.D.

The Plainwell Sanitarium is a private psychiatric hospital licensed by the Michigan Department of Mental Health, and member of the American Hospital Association, Michigan Hospital Association, and National Association of Private Psychiatric Hospitals. Our extensive diagnostic treatment services include the following:

- Organic and psychological therapy for the psychiatrically and emotionally disturbed of all ages.
- Diagnostic evaluation of neurological disorders.
- Rehabilitative services for geriatric and convalescent patients.
- Medico-Legal counsel.
- Diagnostic and psychological evaluation and hospitalization, if indicated, of juveniles for Probate and Juvenile Courts.

You can be there with NCME TV!

The first nationwide medical television service, NCME—The Network for Continuing Medical Education—brings you visually the important achievements of leading medical authorities. By means of closed-circuit television, this independent network provides your hospital or medical school with a complete videotape service that helps shorten the gap between new medical knowledge and its availability for clinical or teaching purposes.

NCME

The Network
for Continuing
Medical
Education

NCME TV Offers These Practical Benefits:

☐ Every two weeks a new 60-minute videotape dealing with three separate medical subjects is sent to participating institutions.

☐ Content and format of NCME telecasts fulfill criteria for postgraduate medical education, permitting American Academy of General Practice course credits under specified conditions.

☐ To help your institution make effective use of closed-circuit television, NCME offers a wide range of services and utilization aids, including:

Technical consultation in setting up a closed-circuit system; advance program information on the contents of each telecast; display units to help publicize programs; expense-paid seminars to improve utilization of medical television.

☐ NCME programs are brief and may be shown as often as desired; you can view the telecasts at times that are most convenient, without disrupting your normal schedule.

☐ Frequently NCME makes available published papers related to subjects presented on closed-circuit television.

A recent NCME hospital telecast presented Philip N. Sawyer, M.D., Professor of Surgery and Head of the Vascular Surgical Service at Downstate Medical Center, Brooklyn, N.Y., in a demonstration and evaluation of "Gas Endarterectomy."

In this program, Dr. Sawyer performs the operation on a patient with gross occlusion of the right iliac, femoral and popliteal arteries.

In Dr. Sawyer's view, gas endarterectomy has several advantages over mechanical methods: the operation can be completed faster, causes less damage to the arteries and offers a more successful outcome.

NCME is an independent network supported by Roche Laboratories to increase the use of closed-circuit TV for medical education under direct hospital and school control.

If your hospital or school does not participate in the biweekly NCME program, information on the cost-free service may be obtained by writing to
NCME, 342 Madison Avenue
New York, N.Y. 10017

Four Cities Receive Model City Grants

Under a new Model Cities Program, planning grants have already been awarded to four Michigan communities: Detroit; Genesee-Flint; Highland Park; and Saginaw.

Public Law 89-754, the Model Cities Program, is intended to revitalize the physical and social environment in blighted areas in cities and demonstrate that social and physical problems in these areas can be solved by concentrated and coördinated application of federal, state and local public and private resources in representative urban areas.

With federal assistance up to 80% of the local contribution, this program can be used to rebuild and revitalize large slum and blighted areas, expand housing, expand jobs and income opportunities, reduce dependents on welfare, improve educational facilities and programs, *combat disease and ill health,* reduce crime and delinquency, enhance recreational and cultural opportunities, establish better access between homes and jobs and in general, improve living conditions.

Michigan physicians will have a prime interest because health components in this program will be concerned with physical and mental health services and facilities excessible to and used by all residents of the area, including health education, personal services, diagnostic and therapeutic services, rehabilitative and restorative services, and areawide environmental health services.

This new program, as well as other federal programs, will attempt to utilize all available resources to attack serious social, economic and health problems and will seek coordination and assistance from MARMP (Michigan Association for Regional Medical Programs).

Other major provisions include the liberalization of FHA and mortgage insurance for group practice facilities, urban renewal, rural housing, land development in the new communities and urban information and technical assistance services.

Michigan Statistics About Health Care

The Health Insurance Institute recently released the following data on health care in Michigan:

Extent of Health Insurance Coverage for Persons Under Age 65 and Other Figures

Number of persons with hospital expense insurance	7,242,000*
Number of persons with surgical expense insurance	6,725,000*
Number of persons with regular medical expense insurance	5,967,000*
Number of persons with major medical expense insurance**	2,146,000
Total health insurance benefits paid (1965)	$608,910,000
By insurance companies for hospital, surgical and medical care, including loss of income	$273,625,000
By Blue Cross, Blue Shield, Medical Society-approved and or-sponsored and independent plans for hospital, medical and surgical care	$335,285,000
Number of health insuring organizations licensed in the state (338 insurance companies, 2 Blue Cross, Blue Shield and Medical Society plans, and 7 independent plans)	347

Hospital Statistics (1966)***

Number of hospitals in state	200
Number of hospital beds available	30,966
Number of persons admitted during the year	1,115,897
Number of persons under hospital confinement on an average day	25,424
Number of full-time hospital personnel per 100 patients	265
Average length of time a patient remained in hospital	8.3 days
Average cost per hospital stay	$436.25
Professional Services	
Number of physicians in private practice (December 31, 1966)	6,603
Number of non-federal dentists (Mid-1966)	4,455
Number of registered, practicing resident pharmacists (Jan. 1, 1967)****	5,175
Number of employed professional registered nurses (1962)	21,465

---

*Net total of people protected—eliminates duplication among persons under age 65 protected by more than one kind of insuring organization or more than one insurance company policy providing the same type of coverage.

**Persons under 65 years of age with insurance company coverage.

***Non-federal, short-term general and other hospitals.

painful night leg cramps...
respond to specific therapy with
QUINAMM™
(Quinine sulfate, 260 mg., Aminophylline, 195 mg.)

The Bettman Archive

Just one tablet at bedtime • Prevents painful night leg cramps • Permits restful sleep

How many of your patients stamp their feet at night and lose sleep because of painful leg cramps? Unless prompted, they usually fail to report this distressing condition and suffer needlessly.

One tablet of QUINAMM at bedtime usually controls distressing night cramps and permits restful sleep with the initial dose.

Prescribing information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Side Effects/Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

THE NATIONAL DRUG COMPANY
DIVISION OF RICHARDSON MERRELL INC
PHILADELPHIA, PENNSYLVANIA 19144

Top 12 Health Insurance Plans* in the USA

(Based on 1966 data from the *Argus Chart* published by the National Underwriter Company, and reprinted from the Michigan Blue Shield - Blue Cross Highlights publication)

	EARNED FEE INCOME	% PAID OUT IN BENEFITS	% USED FOR OPERATING EXPENSES**
1. Metropolitan Life	$718 million	84.3%	14%
2. Aetna Life	626½ million	88.7%	11%
3. Travelers	574 million	88.2%	11.4%
4. Prudential	503 million	77.8%	19.1%
5. New York City Blue Cross & Blue Shield	439 million	95.0%	7.1%
6. Michigan Blue Cross & Blue Shield	374 million	94.0%	4.7%
7. Equitable Society	363½ million	86.3%	11.5%
8. Continental Casualty	357½ million	70.0%	27.0%
9. Mutual of Omaha	356½ million	73.9%	26.8%
10. Connecticut General	241 million	88.1%	13.8%
11. Massachusetts Blue Cross & Blue Shield	223 million	95.1%	4.5%
12. New Jersey Blue Cross & Blue Shield	202 million	93.5%	5.0%

*Blue Cross is a name for 75 autonomous Plans sponsored by hospitals throughout the nation; total Blue Cross membership income for 1966 was $3 billion-plus. Likewise, Blue Shield is the generic name for 73 autonomous Plans sponsored by medical societies throughout the nation; total Blue Shield membership fee income for 1966 was $1.4 billion. Together, then, for 1966 Blue Cross and Blue Shield nationally had $4.14 billion income; this was greater than the premium income of the top 10 commercial companies combined.

The two other members of the "top 10 commercials" are John Hancock Mutual, $186 million income, and Bankers Life & Casualty, $164 million.

**Operating expenses, when added to benefits paid out, will not necessarily come to 100%. On their total health insurance business during 1966, most of the "top 12" were in a gain position. This, despite the fact that eight of the "top 10 commercials" registered losses on group business, one as much as $8 million. Where overall losses were sustained, losses were made up in one of three ways:

(1) adjustment of the fee charged;

(2) investment income, or

(3) subsidy by some other part of the fringe-benefit program. ☐

> ***"Medical education is a continuum. Continuing education should be an integral part of the physician's life — from the time he enters secondary school until the close of his career."***

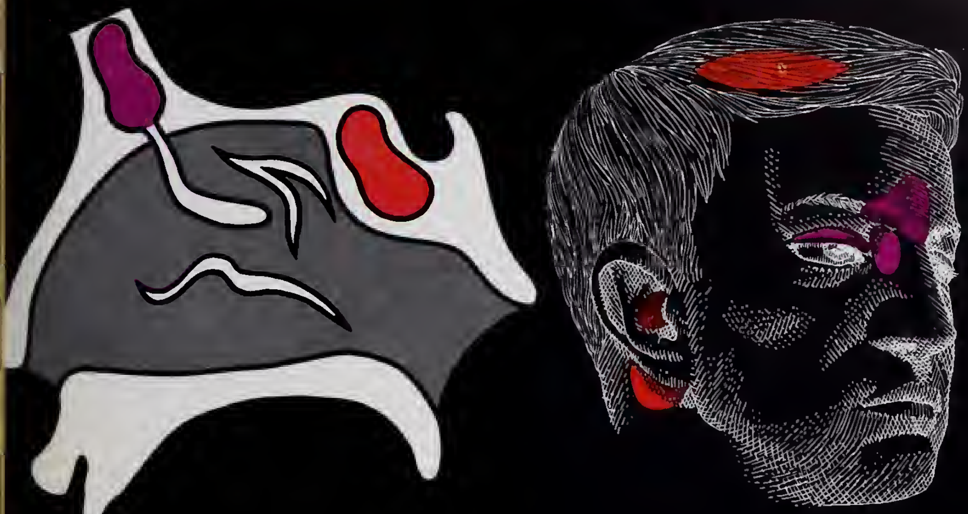
Brief summary. Blurring of vision, dry mouth, difficult urination, and flushing or dryness of the skin may occur on higher dosage levels, rarely on usual dosage. Administer with caution to patients with incipient glaucoma or urinary bladder neck obstruction. Contraindicated in acute glaucoma, advanced renal or hepatic disease or a hypersensitivity to any of the ingredients.

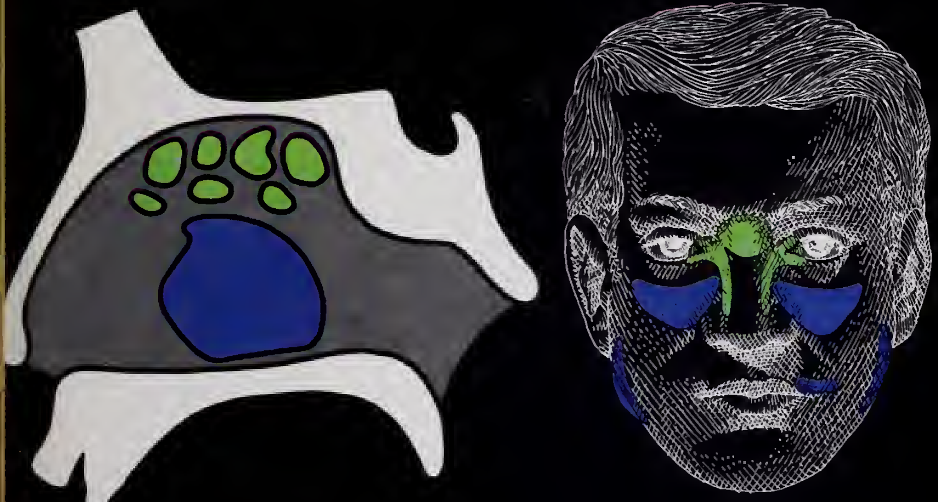
A·H·ROBINS

Sources of sinus headache

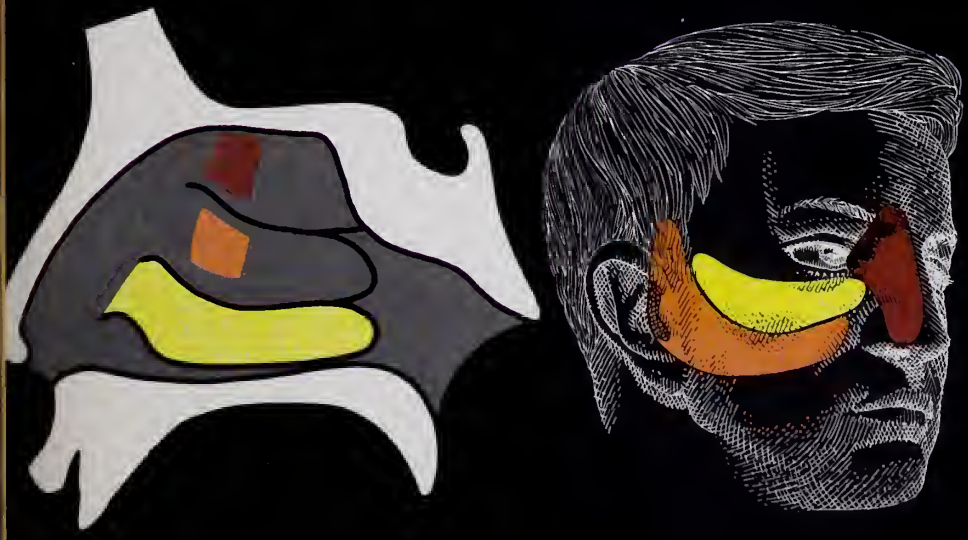


REGION OF SENSATION

FRONTAL SINUS—headache localized over the frontal region, commonly beginning in the morning. Eyes painful to touch, may be slight swelling over eyes, puffy eyelids.
SPHENOID SINUS—most difficult to diagnose. Headache or sense of pressure over vertex. May be pain in ear or mastoid region.



MAXILLARY SINUS—headache and tenderness under eyes at top of cheekbones, usually starting in early afternoon. Possible swelling of cheek. Pain in jaw and back teeth.
ETHMOID SINUS—headache, tightness in upper part of bridge of nose and well down its sides. Pain, deep-seated behind the eyes and in inner corners of the eyes.



TURBINATES—pain along medial and lateral walls of the inside of the nose. Headache in frontal region, along supraorbital ridge, a feeling of fullness in the head.

Source of symptomatic relief

SINUTAB

Sinus headache is often a reflection of congestion in the nasal mucosa. The pain that results in the various regions of the head may help in determining the particular structure(s) responsible. The Sinutab formula is specifically designed for symptomatic relief of sinus headache and nasal congestion. **Sinutab** *not only* **provides an effective decongestant** — to reduce mucosal engorgement and facilitate freer breathing — *and* **an antihistamine** — to help reduce edema and excessive secretions — but it *also* provides, in contrast to other leading decongestants, **two analgesics** for immediate relief of pain and discomfort.

And, too, the Sinutab dosage schedule of 2 tablets, *q. 4 h.* permits controlled and continuing analgesic relief.

Adverse Reactions: Epigastric distress, drowsiness, dizziness, insomnia and nervousness.

Precautions: Instruct patients not to drive or operate machinery if drowsiness occurs. Use with caution in patients with thyroid disease, heart disease, hypertension, diabetes or kidney disease. Excessive dosage or prolonged use may cause kidney damage.

Dosage: Adults—2 tablets every 4 hours.

Each tablet contains 150 mg. acetaminophen, 150 mg. phenacetin, 25 mg. phenylpropanolamine HCl, and 22 mg. phenyltoloxamine citrate.

SPECIFIC FORMULA
SINUTAB®
FOR SINUS HEADACHE

Also Available on Prescription:

Sinutab® with Codeine.* Each tablet contains 15 mg. (¼ gr.) codeine phosphate (Warning: May be habit forming), 150 mg. acetaminophen, 150 mg. phenacetin, 25 mg. phenylpropanolamine HCl, and 22 mg. phenyltoloxamine citrate.

Sinutab® Pediatric Suspension. Each 5 ml. teaspoonful contains 300 mg. acetaminophen, 12.5 mg. phenylpropanolamine HCl, and 10 mg. phenyltoloxamine citrate.

*Subject to Federal Narcotics Regulations.

For 1 complimentary bottle of 30 Sinutab tablets, write: J. S. Travis, Warner-Chilcott Laboratories, Morris Plains, N.J. 07950. Please mention this journal.

When it's more than a bad cold

your patient can feel better while she's getting better

Achrocidin®

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen citrate 25 mg.

In tetracycline-sensitive bacterial infection complicating respiratory allergy, ACHROCIDIN brings the treatment together in a single prescription—prompt relief of headache and congestion together with effective control of the organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN (Tetracycline) equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity* reactions—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

and it's still growing.

To meet your present needs more precisely, the Tubex line comprises 37 different products in 69 dosage variations. And more are on the way.

Tubex offers these unit dose advantages:

- **accuracy**—premeasured, clearly labeled to help ensure correct medication
- **convenience**—no filling, no needle-sharpening, no sterilization, no cleanup
- **simplicity**—precision-made, well balanced syringe breech loads in seconds, permits easy aspiration
- **reduces risk**—single-use cartridge-needle units reduce risk of cross contamination; less chance of spillage reduces risk of contact sensitization for doctor or nurse
- **stability**—glass cartridges can't deteriorate or react with medication
- **acceptability**—presharpened, siliconized needles lessen pain of injection; patients appreciate single-use equipment

Just select, inject, throw away

OMNI-TUSS® b.i.d.

. . . **because** OMNI-TUSS is indicated for cough associated with upper respiratory tract infections, bronchitis, bronchiectasis, bronchial asthma, emphysema, sinusitis and rhinitis, hay fever, or other allergic conditions. Any of these conditions may exhibit the general symptom syndrome—coughing, wheezing, bronchospasm, and tenacious mucus—which may benefit from the antitussive, bronchodilative, antihistaminic, and expectorant action of Omni-Tuss.

The therapeutic usefulness of Omni-Tuss is enhanced by a unique resin complex formulation providing the clinically desirable advantages of: (1) uniform drug availability throughout an extended period, (2) 8 to 12 hours of symptomatic control, (3) minimal dosage requirement, (4) minimal side effects.

Economical, efficient **b.i.d.** dosage—extremely well-tolerated by children, 6-12, and adults.

'Omni Tuss' Suspension: Each teaspoonful (5 cc.) contains 10 mg. codeine (Warning: May be habit-forming), 5 mg. phenyltoloxamine, 3 mg. chlorpheniramine, 25 mg. ephedrine, all as cation exchange resin complexes of sulfonated polystyrene, and 20 mg. guaiacol carbonate.

Available on prescription only. Class X exempt narcotic. Permissible on oral prescription.

Dosage: *Adults:* 1 teaspoonful (5 cc.) q12h.
Children (6-12 *years*): ½ teaspoonful q12h.

Side Effects: Minimal, but when encountered may include jitteriness, nausea, drying of mouth, insomnia, constipation, which disappear upon adjustment of the dose or discontinuance of treatment.

Precautions and Contraindications: For complete detailed information, refer to package insert or official brochure.

Strasenburgh
Strasenburgh Laboratories Division
Wallace & Tiernan Inc., Rochester, N.Y.

new evidence for TAO® (triacetyl-oleandomycin)

No tooth staining reported after 10 years of use.

a macrolide antibiotic for the frequently seen respiratory infection in the office and for a problem pathogen* in the hospital.

*Staphylococcus aureus

study I[1] Results of a 1967 in vitro—in vivo correlation study involving 116 patients with Gram-positive coccal infections in five institutions. All patients were given TAO prior to determining the susceptibility of the offending organism.

97.0% of the organisms were susceptible to oleandomycin*

98.0% of the patients responded favorably to TAO® (triacetyloleandomycin)

*In some cases more than one pathogenic organism was isolated from the patient.

study II[2] Effect of oral therapy with TAO, erythromycin, and cloxacillin on the survival time of Rhesus monkeys after intravenous inoculations of lethal doses of staphylococci, phage type 80/81. (8 monkeys in each group)

conclusion:

*Under the conditions of this study and the doses employed, it was found that **TAO® (triacetyloleandomycin)** was far superior to erythromycin, as was cloxacillin, a bactericidal agent, and of particular interest, "...bacteriostatic triacetyloleandomycin was as effective or perhaps superior to cloxacillin in preventing lethal (staphylococcal, phage type 80/81) infection."

*It should be pointed out that results obtained in an experimental study of this nature may not necessarily be directly extrapolated to the clinical situation as it pertains to man.

TAO Rx Information

INDICATIONS: Include streptococci, staphylococci, pneumococci and gonococci. Recommended for acute, severe infections where adequate sensitivity testing has demonstrated susceptibility to this antibiotic and resistance to less toxic agents. **CONTRAINDICATIONS AND PRECAUTIONS:** Not recommended for prophylaxis or in the treatment of infectious processes which may require more than ten days continuous therapy. In view of the possible hepatoxicity of this drug when therapy beyond ten days proves necessary, other less toxic agents should be used. If clinical judgement dictates continuation of therapy for longer periods, serial monitoring of liver profile is recommended, and the drug should be discontinued at the first evidence of any form of liver abnormality. When treating gonorrhea in which lesions of primary or secondary syphilis are suspected, proper diagnostic procedures, including darkfield examinations, should be followed. In other cases in which concomitant syphilis is suspected, monthly serological tests should be made for at least four months. Contraindicated in pre-existing liver disease or dysfunction, and in individuals hypersensitive to the drug. Although reactions of an allergic nature are infrequent and seldom severe, those of the anaphylactoid type have occurred on rare occasions. When used in streptococcal infections, therapy should be continued for ten days to prevent the development of rheumatic fever or glomerulonephritis. The use of antibiotics may occasionally permit overgrowth of nonsusceptible organisms. A resistant infection or superinfection requires re-evaluation of the patient's therapy. In the event such occurs with this drug the medication should be discontinued, and specific antibacterial and supportive therapy instituted.

235 EAST 42nd STREET
NEW YORK, N.Y. 10017

In the complex picture of moderate to severe anxiety...

there is a new reason for prescribing Mellaril (Thioridazine HCl)

effectiveness in mixed anxiety-depression

Long recognized for its usefulness in the treatment of moderate to severe anxiety, Mellaril is now also known to be effective against mixed anxiety-depression.

Often the symptoms of anxiety states are difficult to sort out—even with the most careful probing. The patient may manifest symptoms of agitation, restlessness, insomnia, somatic complaints. But what of the depression that may be mixed in the total picture? It is reassuring to know that Mellaril may be prescribed—with strong possibilities of success—when there is anxiety alone or a mixture of anxiety and depression.

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. *following is a brief precautionary statement.*
Contraindications: Severe central nervous systen depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.
Warnings: Administer cautiously to patients whc have previously exhibited a hypersensitivity reac (e.g., blood dyscrasias, jaundice) to phenothiazine Phenothiazines are capable of potentiating centra nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.
Precautions: There have been infrequent reports leukopenia and/or agranulocytosis and convulsiv seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentar retinopathy may be avoided by remaining within recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving Orthostatic hypotension is more common in fema than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess 300 mg. should be used only in severe neuropsychiatric conditions.
Adverse Reactions: *Central Nervous System—* Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism an other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System—*Dryness of mouth, blurred visi constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System—* Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin—*Dermatitis and skin eruptions of the urtica type, photosensitivity. *Cardiovascular System—* Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers including Mellaril (thioridazine hydrochloride). While there is no evidence at present that these changes are in any way precursors of any signific disturbance of cardiac rhythm, several sudden an unexpected deaths apparently due to cardiac arre have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other—*A single case described as parotid swelling.

Mellaril®
(Thioridazine HCl)
25 mg. t.i.d.

for moderate to severe anxie and mixed anxiety-depressio

SANDOZ SANDOZ PHARMACEUTICALS, HANOVER, N. J.

Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® tablets in two different formulations.

And let you control the dosage.

NOVAHISTINE LP
NOVAHISTINE SINGLET

Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.
Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

With Novahistine LP tablets and Novahistine Singlet™ tablets you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient.

Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever. Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.

Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.

Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

"Nothing else I've tried seems to work, so I decided to give you a crack at it."

These Firms Make '68 Annual Session Possible without a Registration Fee

One of the colorful and educational aspects of the MSMS Annual Session in Detroit this September will be the interesting array of exhibits.

MSMS leaders say, "Take time to inspect each one — not just a casual look — but a real indepth study. You will be surprised at the wealth of new information they will offer you."

Following is a list of the firms who will be presenting displays at the 1968 MSMS Annual Session. Doctors are urged to make a special effort to visit each booth to personally express appreciation and to ask questions.

Income from the leasing of exhibit space makes it possible for MSMS to present its excellent Annual Scientific Session without a registration fee.

The intermission periods between scientific sessions will provide excellent opportunities to study the exhibition. The registration desk, meeting rooms, and exhibits will be conveniently located on the same floor as the meetings.

MSMS also wishes to express its gratitude to those who have generously made program grants to the Annual Session. These contributors are:

When it's time for Thorazine® brand of chlorpromazine

...can you depend on less?

For profound calming effect in moderate to severe mental and emotional disturbances of everyday practice.

Before prescribing, see complete information, including adverse effects reported with phenothiazines and symptoms and treatment of overdosage, in SK&F literature or *PDR*. The following is a brief precautionary statement.

Contraindications: Comatose states or the presence of large amounts of C.N.S. depressants.

Precautions: Potentiation of C.N.S. depressants may occur (reduce dosage of such agents when used concomitantly). Use with caution in patients with chronic respiratory disorders. Antiemetic effect may mask overdosage of toxic drugs or obscure other conditions. Administer in pregnancy only when necessary. Because of possible drowsiness use cautiously and warn patients who operate vehicles or machinery.

Adverse Reactions: Drowsiness; dry mouth; nasal congestion; constipation; amenorrhea; miosis; mild fever; weight gain; hypotensive effects, sometimes severe with I.M. administration; epinephrine effects may be reversed; dermatological reactions; parkinsonism-like symptoms on high dosages (in rare instances, may persist); lactation and moderate breast engorgement (in females on high dosages); and less frequently, cholestatic jaundice (use cautiously in patients with liver disease). Adverse reactions occurring rarely, include: mydriasis; agranulocytosis; skin pigmentation; epithelial keratopathy; lenticular and corneal deposits (after prolonged substantial doses).

Available: Tablets, 10 mg., 25 mg., 50 mg., 100 mg. and 200 mg.; Spansule® capsules, 30 mg., 75 mg., 150 mg., 200 mg. and 300 mg.; Injection, 25 mg./cc.; Syrup, 10 mg./5 cc.; Suppositories, 25 mg. and 100 mg.

New State Laws, Now In Effect, Explained

(Editor's Note: This first article in a series describes the Senate bills which passed the 1968 legislature and were given immediate effect. Next month, an article will discuss the House-introduced new laws which went into effect upon being signed by the governor.

During the 1968 session, the Michigan State Legislature enacted 26 new important health laws, 11 of them originating in the Senate and the remaining 15 having been initially presented in the House.

In the case of each new law, however, unless the Legislature orders that the law shall become effective upon signature by the Governor, the law does not become operative until 90 days after the Legislature finally adjourns. Since it is now anticipated that the 1968 adjournment will come in late August, many new health laws will not have effect until the latter part of November, 1968.

This first article will discuss the salient features of those Senate bills which passed the entire Legislature, were given immediate effect and have been signed by the Governor. Any Senate bills not covered in this article may be assumed to lack effect for several more months (such as the new hospital licensing law, for example) and will be explained in a subsequent article published near the date the law becomes operative.

CHIROPRACTORS, under new Public Act 73 of 1968, now practice under the following definition: chiropractic is considered to be "the locating of misaligned or displaced vertebrae of the human spine, the procedure preparatory to and the adjustment by hand of such misaligned or displaced vertebrae and surrounding bones and tissues, for the restoration and maintenance of health."

The law now goes on to provide: A licensed doctor of chiropractic under this act may use X-ray and such analytical instruments as are approved by the Michigan board of chiropractic examiners in the examination of patients solely for the purpose of locating misaligned or displaced vertebrae of the human spine and for the procedures preparatory thereto.

It should also be noted that the law now provides that the Chiropractic board *may* suspend or revoke a chiropractor's license for: "being guilty of false, fraudulent or misleading advertising or advertising in which grossly improbable statements are made; or advertising in any publication or media free services or consultation, or the prices for which his services are available; or for having professional connection with any firm of corporation who advertises contrary to these provisions."

Persons noting a chiropractor advertising in such a manner as is prohibited above should, the law says, write to the Chiropractic board secretary (200 Lafayette Building, in Detroit), in triplicate. The board *may* call a hearing and can discipline the offender if it finds him guilty. It should be noted that this law has always given this board authority to discipline for "fraudulent," "grossly improbable," or "misleading" statements. The new element is the prohibition against advertising "FREE" services, or stating fees for services.

COUNTIES WITH LESS THAN 75,000 population which have not previously availed themselves of the provisions of the Community Mental Health Services Act, Act 54 of 1963, may now join in an existing program in an adjacent county, if the adjacent county's board of supervisors approves and if the State Department of Mental Health grants necessary approvals also. The new law making this possible is Public Act 205 of 1968.

IMPORTANT FLUORIDATION legislation was passed by the adoption of Public Act 346 of 1968, which makes two important provisions. First, it specifically prohibits any instrumentality of state government from ordering the fluoridation of water supplies. Second, it provides as a legislative action that *all* public water supplies must be fluoridated before July 19, 1973 *unless* the addition of fluoride has been rejected by an ordinance of the local governing body or by a majority of the electors voting on the question.

Townships and counties may now either operate, OR CONTRACT FOR, ambulance and inhalator services under the provisions of Public Act 163 of 1968. The law became effective on June 17 and provides "good samaritan" protection for ambulance drivers, attendants, policemen and firemen (except for acts or omissions constituting gross negligence or willful and wanton misconduct, as well as requiring the passage of a Red Cross first aid course by such persons before they are entitled to the protection of the law.

Here is a quote from the new statute: "The township board of any township and the board of supervisors of any county may operate or join with another municipality or contract with persons, firms, organizations or corporations in operating or furnishing an ambulance and inhalator service for the use and benefit of the residents of the township or county. The service by the town-

ship or the county may be in connection with fire protection service or as a separate operation."

The Michigan law governing the Department of Social Services in its administration of the categorical aid programs (old age assistance, aid to the blind, aid to dependent children, and aid to the permanently and totally disabled) has been amended by Public Law 232 of 1968 to permit third parties, acting in behalf of applicants, more latitude to function on the applicant's behalf. This new law, a purely technical administrative change, takes cognizance of the growing utilization of third parties.

Also in regard to the categorical assistance programs, the Legislature in passing Public Act 169 of 1968 has clearly stated that while other records, applications, etc. shall be open to inspection "All records relating to persons applying for, receiving or formerly receiving medical services under the categorical assistance programs . . . . shall be confidential and shall be used only for purposes directly and specifically related to the administration of the medical program."

THE FOREGOING SIX new health laws are presently in effect. Other important health legislation, which will not become effective until late November of 1968 and which will be reviewed in a future article, includes hospital licensing, added funds for alcoholism programs, sex education, waiver of basic science requirement due to passage of national boards, and making it a felony (rather than a misdemeanor) to practice medicine without a license.

The next article in this series will cover House-introduced new laws passed in 1968 which went into effect upon being signed by the Governor.

Hemophilia Clinic Slated Soon in Grand Rapids

An Evaluation and Diagnostic Clinic, sponsored by the Michigan Chapter, National Hemophilia Foundation, will be held Saturday, September 28, at Butterworth Hospital, Grand Rapids.

Physicians having hemophilic patients who would benefit from this clinic may contact the office of John Penner, M.D., Hemophilia Control, Room S 6360, University Medical Center, Ann Arbor, and an application and referral form will be sent.

Participating in the clinic will be Doctor Penner, G. Anderson, M.D., Grand Rapids; Genevieve Howen, M.D., Grand Rapids; Claude Raby DDS, Grand Rapids. ☐

U-M Hospital Predicts Need for $110 Million In Expansion by 1978

A long-range planning report prepared for the University of Michigan Hospital anticipates a construction program totaling about $110 million within the next decade "to meet the immediate health care needs" of the institution through the year 2000.

BLUE CROSS COMPUTERS SERVING LOCAL HOSPITALS

Michigan Blue Cross has added a new dimension in computer service for Michigan hospitals.

The Hospital Computer Services, a new division, offers to Blue Cross participating hospitals a complete range of computer services supported by a staff of professional consulting and systems people.

Wm. S. McNary, Blue Cross president, said, "This new program links Michigan hospitals to a central computer for the purpose of performing a number of administrative services — quickly, efficiently and at lower cost than any individual hospital could hope to achieve."

In this respect, Michigan Blue Cross is the first Plan in the country to have a pilot project that is working with clinical people and trying to adapt computer technology to clinical requirements. This is a job of magnitude and complexity with different objectives from that of the business office.

In carrying out this role, Blue Cross is uniquely capable because of its technological capability, experience, and economic strength already dedicated to minimizing hospital costs and improving patient care.

Recent studies have indicated that the need for information processing assistance to hospitals has become more acute as governmental, medical, administrative and population demands on hospitals have increased and become more complex. These demands necessitate increased expansion in clinical and administrative processing and reporting requirements. The federal government is already interested in the management techniques and economics of hospitals as well as the level or scope of patient care through its regional medical programs — programs like Medicare, Medicaid, and hospital and medical insurance for Federal Employees.

Cottage Hospital in Grosse Pointe Farms, was the first Michigan institution to elect to share the Blue Cross Hospital Computer Service. Art Center Hospital will join in September and Sinai Hospital in November. ☐

Enduron: (methyclothiazide) A basic building block for mild hypertensives

METHYCLOTHIAZIDE
No. 6812
ENDURON®
METHYCLO-
THIAZIDE
5 mg

Excellent day-long Na^+ output, yet easy on the K^+

Enduron provides an excellent starting therapy. Your patient' sodium excretion is greatly enhanced. Yet potassium loss is low

The therapeutic action is smooth, and persists for a full 24 hours With Enduron you can prescribe convenient once-a-day dosag without skimping your patients on day-long thiazide effectiveness

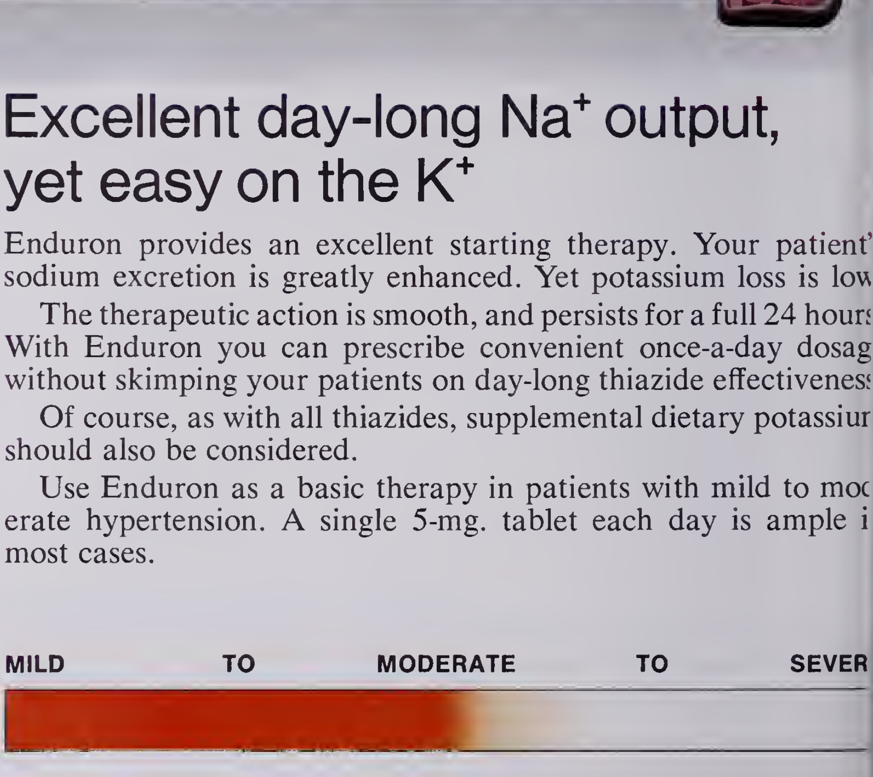
Of course, as with all thiazides, supplemental dietary potassiur should also be considered.

Use Enduron as a basic therapy in patients with mild to moc erate hypertension. A single 5-mg. tablet each day is ample i most cases.

Once a day, every day

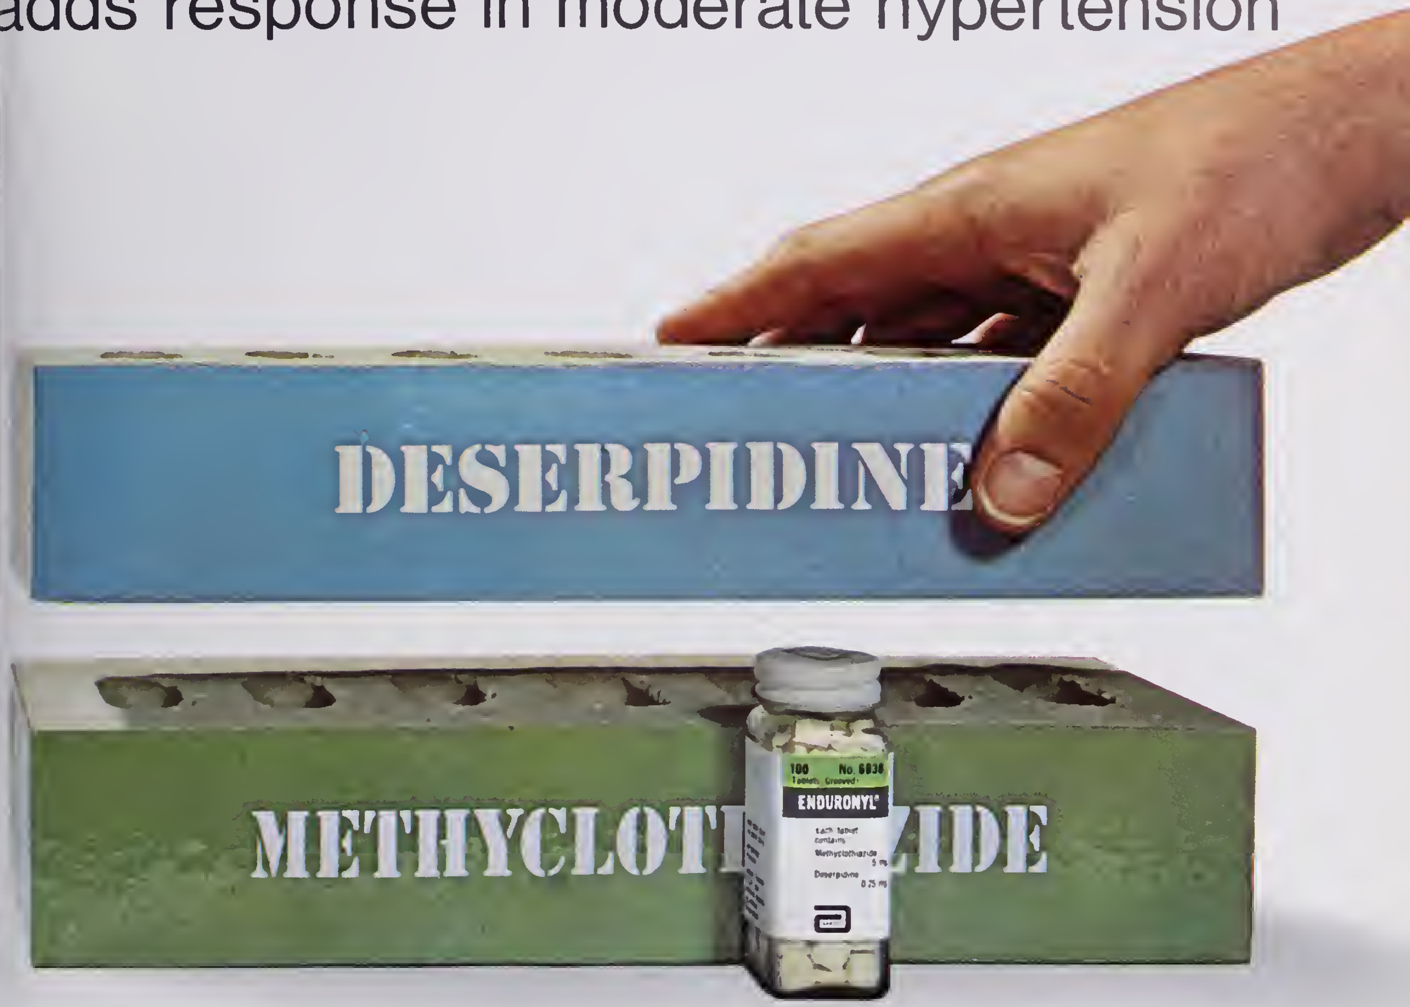
ENDURON

METHYCLOTHIAZIDE



See Brief Summary on final page of advertisement

Enduronyl: Its deserpidine component adds response in moderate hypertension



Less frequent rauwolfia side effects than with reserpine

When you wish to build further response, consider shifting to Enduronyl.

Enduronyl adds a building block of *deserpidine*. This is a purified rauwolfia alkaloid available only from Abbott. It adds good antihypertensive and tranquilizing activity. Yet its incidence of untoward effects, particularly lethargy and depression, is lower than with reserpine.

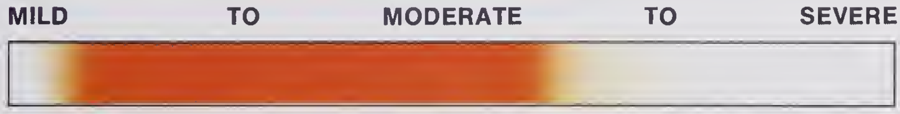
Enduronyl is available plain or Forte. The latter provides its variation where most helpful, by doubling the deserpidine.

Use Enduronyl for patients throughout the broad range of mild to moderately severe hypertension.

Once a day, every day

ENDURONYL®

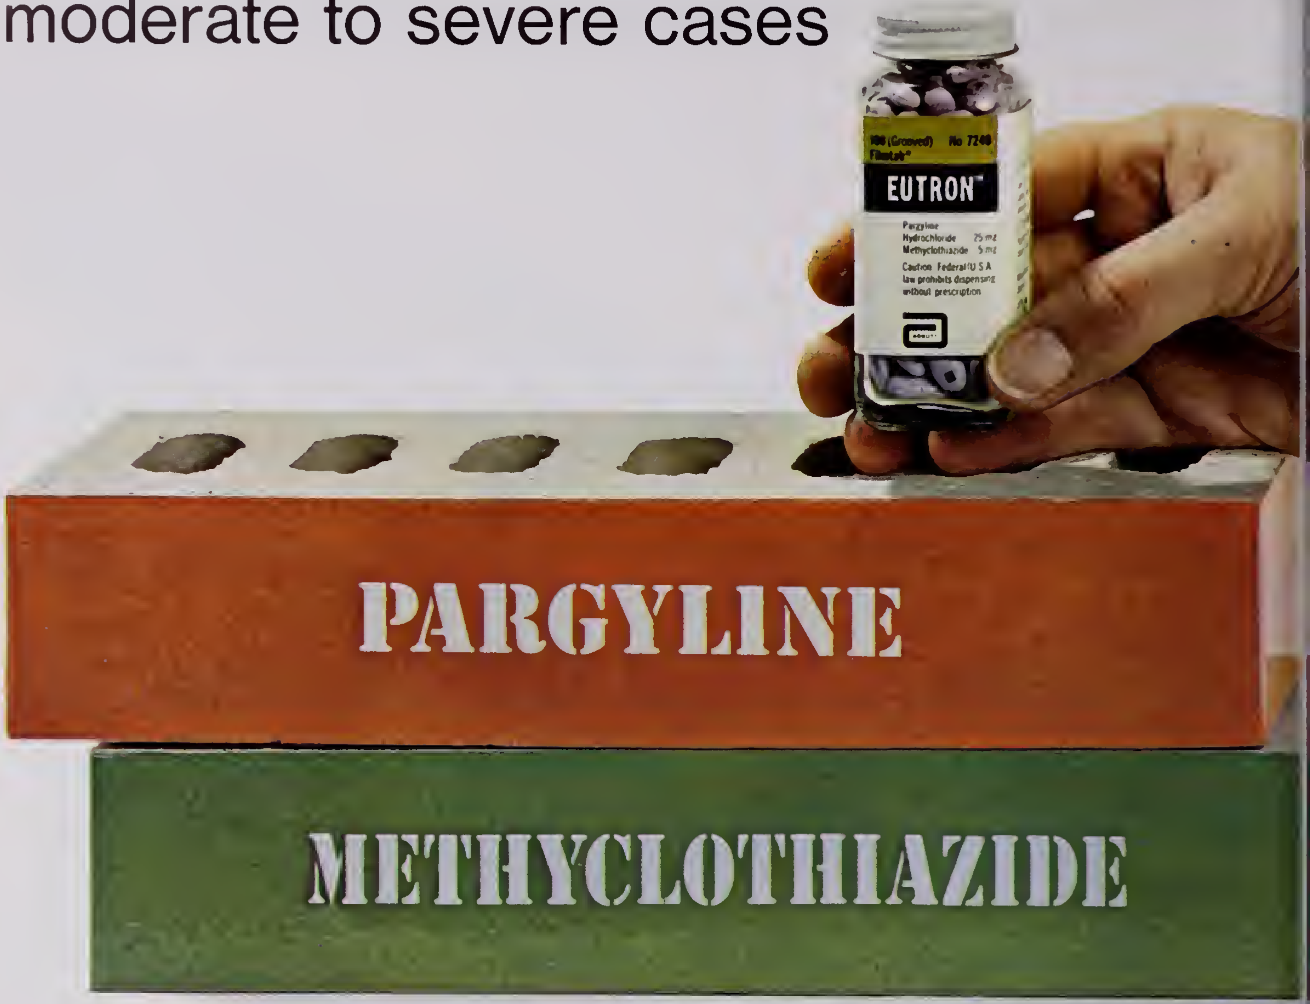
METHYCLOTHIAZIDE 5 mg. with
DESERPIDINE 0.25 mg. or (FORTE) 0.5 mg.



See Brief Summary on final page of advertisement

801094

Eutron: A unique combination for handling moderate to severe cases



100 (Grooved) No 7240
Filmtab®
EUTRON™
Pargyline Hydrochloride 25 mg
Methyclothiazide 5 mg
Caution Federal (U.S.A.) law prohibits dispensing without prescription
PARGYLINE
METHYCLOTHIAZIDE

Affords almost uniform diastolic reduction in all body positions

Eutron lowers diastolic pressures nearly equally, whether you patient is standing up or lying down.

Thus, in clinical trials, average *standing* diastolic readings wer reduced from 112 pre-treatment to 90 post-treatment; *sitting* fro 115 to 95; and *recumbent* from 112 to 94.

Note that following Eutron, the diastolic reductions were nearl alike in all three body positions.

Use Eutron for managing your moderate to severe cases. It building blocks enhance each other; hence lesser doses often suffice

Once a day, every day

EUTRON™

PARGYLINE HYDROCHLORIDE 25 mg.
with METHYCLOTHIAZIDE 5 mg.

MILD TO MODERATE TO SEVER

See Brief Summary on final page of advertisement

80109

ENDURON®

METHYCLOTHIAZIDE

ENDURONYL®

Each tablet contains
Methyclothiazide 5 mg. with
Deserpidine 0.25 mg. or 0.5 mg.

Indications: Edema and mild to moderate hypertension (Enduron), and mild to moderately severe hypertension (Enduronyl). More potent agents, if added, can be given at reduced dosage.

Contraindications: Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease or impending hepatic coma (hepatic coma due to hypokalemia has been reported in patients on thiazides). Do not use Enduronyl in severe mental depression, suicidal tendencies, active peptic ulcer, or ulcerative colitis.

Warnings: Consider possible sensitivity where there is history of allergy or asthma. If added potassium is indicated, dietary supplementation is recommended. Reserve enteric-coated potassium tablets for cautious use only when necessary, as they may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation often requiring surgery; discontinue them immediately if abdominal pain, distention, nausea, vomiting, or g.i. bleeding occurs. Neither Enduron nor Enduronyl contains added potassium.

Precautions: Use thiazides cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery, thiazides may reduce response to vasopressors, and increase response to tubocurarine. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia) in all patients. In hypokalemia (especially in digitalized patients) give supplemental potassium. In hypochloremic alkalosis, give supplemental chloride.

Use rauwolfias with caution in patients with history of peptic ulcer. Rauwolfias with anesthetics may produce hypotension and bradycardia. Discontinue Enduronyl two weeks before elective surgery. Consider vagal blocking agents during emergency surgery. In epilepsy, adjust anticonvulsant dosage. In electroshock, shorten stimulus strength and duration. In occasional patients with depressive tendencies, rauwolfias may precipitate severe mental depression that usually disappears when drug is stopped.

Adverse Reactions: Thiazide reaction include blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, serum uric acid or blood sugar; anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice, symtomatic gout, and pancreatitis. Cutaneous vasculitis in the elderly has been reported with other thiazides. Adverse effects with deserpidine are qualitatively similar to those with reserpine, but their incidence is lower. These include nasal stuffiness, abdominal cramps or diarrhea, nausea, headache, weight gain, reduced libido and potency, peptic ulcer aggravation, epistaxis, skin eruption, asthma in susceptible patients, electrolyte imbalance, excessive salivation, and a reversible Parkinson's syndrome. Excessive drowsiness, fatigue, weakness, and nightmares may signal mental depression. Thrombocytopenia, purpura, and a symptom manifested by dull sensorium, deafness, uveitis, glaucoma, and optic atrophy are rare allergic reactions to other rauwolfias. Hypotension from antihypertensive agents may precipitate angina attacks in susceptible individuals. Usually adverse reactions disappear when drug is withdrawn.

EUTRON™

Each tablet contains
Pargyline Hydrochloride 25 mg.
with Methyclothiazide 5 mg.

Indications—Moderate to severe hypertension.

Contraindications—Pheochromocytoma, paranoid schizophrenia, hyperthyroidism and advanced renal failure. Not recommended in malignant hypertension, children under 12, pregnant patients.

Do not use with: centrally or peripherally acting sympathomimetic drugs; foods high in tyramine (e.g., aged and natural cheeses); parenteral reserpine or guanethidine; imipramine, amitriptyline, desipramine, nortriptyline or their analogues; other monoamine oxidase inhibitors; methyldopa or dopamine; separate Eutron and these agents by two weeks.

Sensitivity to thiazides; severe renal disease (except nephrosis) or shutdown; severe hepatic disease; impending hepatic coma from thiazide-induced hypokalemia.

Warnings—Patients: 1. No other drugs (particularly "cold preparations" and antihistamines), cheese or alcohol without physician's consent. 2. Promptly report orthostatic symptoms, severe headache, other unusual symptoms. 3. Angina pectoris or coronary artery disease patients must not increase physical activity with improved anginal symptoms or well-being.

Physicians: 1. Use antihistamines, hypnotics, sedatives, tranquilizers and narcotics (meperidine contraindicated) cautiously in reduced doses. 2. Stop Eutron two or more weeks before elective surgery; in emergency surgery reduce premedication (narcotics, sedatives, analgesics, etc.) to 1/4 to 1/5; carefully adjust anesthetic dosage to patient response. 3. Use cautiously in advanced renal failure. 4. Pargyline may induce hypoglycemia. 5. Consider possible sensitivity reactions when a history of allergy or asthma is present. 6. If potassium is indicated, dietary supplement is recommended; enteric-coated potassium tablets may induce serious or fatal small bowel lesions (stenosis with or without ulceration), cause obstruction, hemorrhage, and perforation frequently requiring surgery; discontinue medication immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs; Eutron does not contain added potassium. 7. Possible systemic lupus erythematosus has been reported for thiazides.

Precautions—Pargyline: Use cautiously at reduced dosage: caffeine, alcohol, antihistamines, barbiturates, chloral hydrate, other hypnotics, sedatives, tranquilizers, narcotics. Periodically do urinalyses, blood counts, liver function tests, etc. Use with caution in liver disease. Watch for orthostatic hypotension, especially in impaired circulation (e.g., angina pectoris, coronary artery disease, cerebral arteriosclerosis); also, augmented hypotension in concomitant febrile illnesses. Reduce or discontinue if hypotension is severe. In impaired renal function watch for cumulative drug effects, elevated BUN and other evidence of progressive renal failure; withdraw drug if these persist. In surgery increased central depressant response (hypotension and increased sedative effect) can be controlled by (1) discontinuing at least two weeks prior; (2) in emergency surgery lowering dose of premedication; (3) when necessary, administering a vasopressor. Do not use in hyperactive and hyperexcitable patients. Pargyline may unmask severe psychotic symptoms where emotional problems pre-exist. Use cautiously in Parkinsonism, especially with antiparkinsonian agents. In prolonged therapy, examine for change in color perception, visual fields, fundi and visual acuity. Also, prolonged therapy has made certain patients refractory to nerve blocking effects of local anesthetics.

Methyclothiazide: Use cautiously in severe renal dysfunction, impaired hepatic function or progressive liver disease; also in pregnancy (bone marrow depression, thrombocytopenia, and altered carbohydrate metabolism have been reported in certain newborn). In surgery thiazide may reduce vasopressor response and increase tubocurarine response. Antihypertensive response may be enhanced following sympathectomy. Watch for electrolyte imbalance (e.g., hyponatremia). Give supplemental chloride if hypochloremic alkalosis occurs and supplemental potassium if hypokalemia occurs (especially in digitalized patients). Thiazides may decrease serum P.B.I. without signs of thyroid disturbance.

Adverse Reactions — Pargyline: Orthostatic hypotension and associated symptoms, mild constipation, fluid retention, edema, dry mouth, sweating, increased appetite, arthralgia, nausea, vomiting, headache, insomnia, difficult in micturition, nightmares, impotence, delayed ejaculation, rash, purpura, weight gain, hyperexcitability, increased neuromuscular activity and other extrapyramidal symptoms. Drug fever is extremely rare. Reduction in blood sugar and hypoglycemic effects are possible. Congestive heart failure has been reported in a few patients with reduced cardiac reserve.

Methyclothiazide: Blood dyscrasias (thrombocytopenia with purpura, agranulocytosis, aplastic anemia); elevation of BUN, blood sugar or serum uric acid (gout may be induced); anorexia, nausea, vomiting, diarrhea, headache, dizziness, paresthesia, weakness, skin rash, photosensitivity, jaundice and pancreatitis. Cutaneous vasculitis in elderly patients has been reported with other thiazides.

If side effects are severe or persist, reduce dosage or withdraw drug. 804438R

ABBOTT

TM-TRADEMARK

IN MEMORIAM

Lawrence Berman, M.D., Detroit

Lawrence Berman, M.D., professor at the Wayne State University School of Medicine, died July 8. He was 59.

Doctor Berman's teaching appointments at Wayne State University were Professor of Hematopathology, Associate in Anatomy, and Associate in Medicine. He was affiliated with Veterans, Oakwood, Beaumont, St. Joseph's, Mercy, Sinai, and Receiving hospitals in Detroit, and St. Joseph's Hospital, Pontiac.

He received the M.D. degree from the University of Minnesota in 1937. He interned at Minneapolis General Hospital, Minneapolis, Minnesota, 1936-37, and did a residency at the University of Minnesota Hospital from 1938-41. He did postgraduate studies in pathology and hematology and received the M.S. degree in 1941.

Doctor Berman was a member of the International Hematology Society, American Board of Pathology, American Society of Pathologists and Bacteriologists, American Society of Clinical Pathologists, College of American Pathologists, Phi Beta Kappa, Sigma Xi and Alpha Omega Alpha. He published extensively in scientific journals.

P. F. Coleman, M.D., Livonia

Peter F. Coleman, M.D., Livonia specialist in obstetrics and gynecology, died July 8 at the age of 64.

Doctor Coleman received his premedical education at City College of New York, New York City, and his M.D. degree from Rush Medical College, Chicago, Illinois, in 1930. Internship was done at the Cook County Hospital and Chicago Lying-In Hospital, 1930-31. His residency was at New York Polyclinic Hospital, 1943-45. He did postgraduate work at Basic Science University of Pennsylvania Medical School.

He was affiliated with St. Joseph Hospital and Grace Hospital, Detroit, and Plymouth General Hospital.

Doctor Coleman was a member of the American Society of Abdominal Surgeons and the American Board of Obstetrics and Gynecology. He was also a member of Kiwanis of Livonia and Phi Delta Upsilon medical fraternity.

A. J. Telego, M.D., Grand Rapids

Anthony J. Telego, M.D., pathologist at Blodgett Memorial Hospital, Grand Rapids, died July 18. He was 50.

Doctor Telego was graduated in 1949 from the Marquette University School of Medicine in Wisconsin. His internship was done from 1949-50 at E. W. Sparrow Hospital in Lansing, where he was a resident in pathology from 1950-51.

After three years in general practice in Youngstown, Ohio, Doctor Telego served in the U.S. Army Medical Corps, 1954-56, as Chief of Laboratory Service of the U.S. Army Hospital, Ft. Leonard Wood, Missouri. In 1956-57, he did a residency in pathology at Sibley Hospital and Hunter Laboratory, Washington, D.C. He joined the staff at Blodgett Hospital in 1958.

He was a member of the American Society of Clinical Pathologists, Association of Clinical Scientists, Association of Clinical Pathologists, Michigan Society of Pathologists, and Phi Chi fraternity.

A. E. Thomas, M.D., Detroit

Alfred E. Thomas, M.D., Detroit physician and civic leader, died July 1 at the age of 59.

Doctor Thomas received his M.D. degree in 1937 from Meharry Medical College and later served as a member of the Meharry Board of Trustees. He was awarded an honorary doctorate from Ferris Institute where he did his premedical studies.

During World War II, he served in the U.S. Army Medical Corps, earning the rank of Lieutenant Colonel. He was a flight surgeon for the 99th Pursuit Squadron stationed at Tuskeegee Army Airfield in Alabama, and he later served in Liberia, West Africa.

Long active in the NAACP in Detroit and nationally, Doctor Thomas was a member of the first Human Relations Committee of the Detroit Police Department. He was a contributor to the African Art Gallery of the Detroit Institute of Arts and established an annual scholarship at the University of Windsor. He founded and managed two hospitals in Detroit.

OFFER BIBLIOGRAPHY ON EMERGENCY SERVICES

A list of folders and booklets has been compiled by the Michigan State Medical Society which deal with emergency medical care and emergency ambulance service.

These publications, which will be of great assistance to staff persons, are available for the asking. The list can be obtained by writing PR Committee, MSMS, P.O. Box 152, East Lansing, Mich.

Building, Clinic, Practice For Sale

The clinic and practice together with medical equipment covering eleven (11) offices as well as accounts receivables of the late Dr. Leo B. Saraf. The highest offer will be accepted.

WSU GETS GRANT

A U. S. Public Health Service grant of $85,919 will be used to continue studies of protein synthesis in heart muscle, directed by Richard J. Bing, M.D., Birmingham, professor and chairman of internal medicine at Wayne State University.

MICHIGAN FIRM SELLS DIAPER ANTIBIOTIC SPRAY

For the past three years, several Detroit and Jackson physicians have been testing a new diaper antibiotic. Approved in January of this year for over-the-counter sale by the FDA, the testing program was correlated by Ethan L. Stone, M.D., medical director of DaRoche Laboratories, Inc.

The antibiotic is a neomycin sulphate aerosal spray which is used for the prevention of ammonia diaper and diaper odors.

Called "Dapper Diaper," the new product is being manufactured by DaRoche Laboratories in Jackson. Vice-President of the corporation is John B. Holst, M.D., a Jackson allergist. Doctor Holst reports the new antibiotic is helpful in both pediatric and geriatric practice. Physician samples can be obtained from DaRoche Laboratories, at 533 Hupp, in Jackson. ☐

in the treatment of
IMPOTENCE

Android®
(thyroid-androgen) TABLETS

*Effectiveness confirmed by another double blind study**

1. SUMMARY
ANDROID GOOD TO EXCELLENT 75%
PLACEBO 20%
2. Forty cases reported.
3. Cites synergism between androgen and thyroid.
4. No side effects in patients treated.
5. Alleviation of fatigue noted
6. Case histories on 4 patients.
7. Although psychotherapy still needed, role of chemotherapy cannot be disputed.

"Sexual impotence treatment with methyl testosterone – thyroid (ANDROID) a double blind study" – Montesano, Evangelista: Clinical Medicine, April 1966.

CONTRAINDICATIONS—Methyl testosterone is not to be used in malignancy of reproductive organs in male, coronary heart disease. Thyroid is not to be used in heart disease, hypertension unless the metabolic rate is low.

Choice of **4** *strengths*

Android

Each yellow tablet contains:

Methyl Testosterone	2.5 mg.
Thyroid Ext. (1/6 gr.)	10 mg.
Glutamic Acid	50 mg.
Thiamine HCL	10 mg.

Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-HP
HIGH POTENCY

Each red tablet contains:

Methyl Testosterone	5.0 mg.
Thyroid Ext. (½ gr.)	30 mg.
Glutamic Acid	50 mg.
Thiamine HCL	10 mg.

Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-X
EXTRA HIGH POTENCY

Each orange tablet contains:

Methyl Testosterone	12.5 mg.
Thyroid Ext. (1 gr.)	64 mg.
Glutamic Acid	50 mg.
Thiamine HCL	10 mg.

Dose: 1 or 2 tablets daily.
Available:
Bottles of 60, 500.

Android-Plus
WITH HIGH POTENCY
B-COMPLEX AND VITAMIN C

Each white tablet contains:

Methyl Testosterone	2.5 mg.
Thyroid Ext. (¼ gr.)	15 mg.
Ascorbic Acid (Vit. C)	250 mg.
Thiamine HCL	25 mg.
Glutamic Acid	100 mg.
Pyridoxine HCL	5 mg.
Niacinamide	75 mg.
Calcium Pantothenate	10 mg.
Vitamin B-12	2.5 mcg.
Riboflavin	5 mg.

Dose: 2 tablet twice daily.
Available: Bottles of 60, 500.

also available with ESTROGEN

Android-E

Each Tablet Contains:

Methyl Testosterone	2.5 mg.
Ethinyl Estradiol	0.02 mg.
Thyroid Ext. (1/6 gr.)	10 mg.
Thiamine Hydrochloride	10 mg
Glutamic Acid	50 mg.

INDICATIONS: Advantage is taken of the anabolic action of ANDROID without its virilizing effect. Estrogen balances the androgen—only steroid effect remains. Geriatrics, post operative and debilitating disease, osteoporosis. **DOSE**: One tablet t.i.d. Female patients should have a rest period 5 to 7 days after 21 days of medication. **SIDE EFFECTS**. In the female, excessive dosage may produce virilizing effects of most androgens, hoarseness, hirsutism, enlarged clitoris. Symptoms can be avoided by keeping the dosage below 300 mg. of testosterone per month. **CONTRA-INDICATIONS**: See Android. Ethinyl estradiol is not to be used in latent malignancy of reproductive organs or mammary glands.

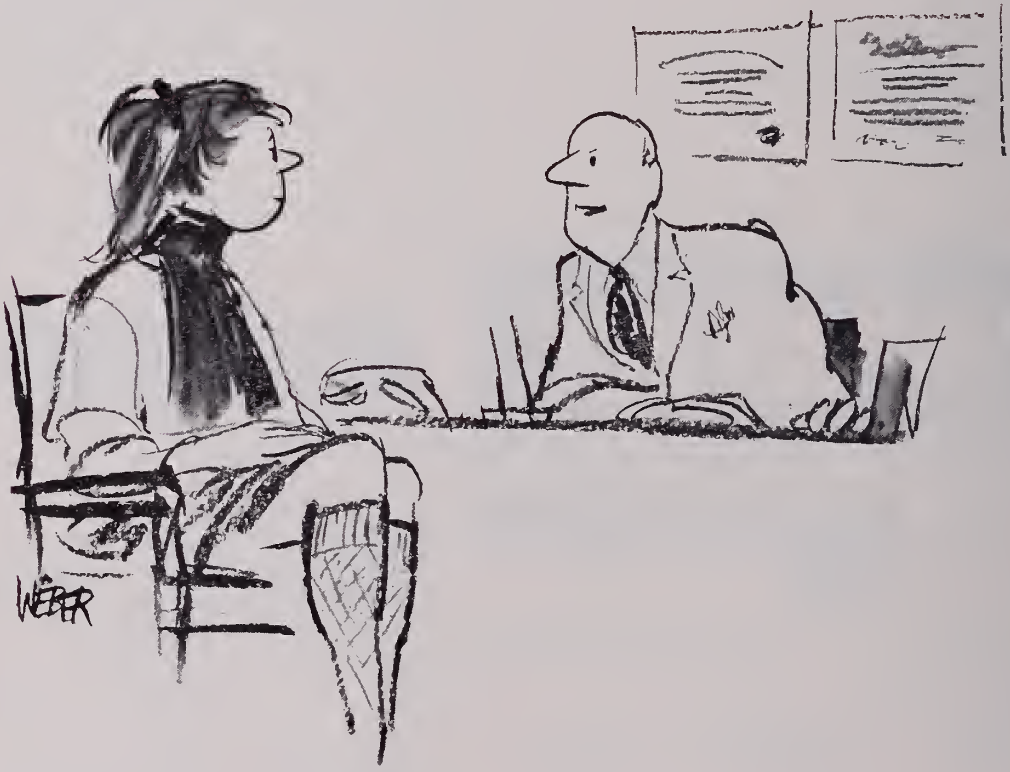
REFER TO PDR



"Now that your acne is clearing up nicely, it might be a good idea if you started losing some weight."

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Blessed event?

Not entirely, when nausea and vomiting occur in early pregnancy. Emetrol offers prompt and safe relief. Local rather than systemic action provides emesis control on contact with the hyperactive G.I. tract.* In a study of 123 pregnant women, the drug produced measurable improvement in 79% of patients in controlling vomiting.[1]

*As shown by *in vitro* studies.

MICHIGAN MEDICINE

Program
1968 Annual Session

The Planning Committee assures you that the 1968 Annual Scientific Session provides multiple opportunities to obtain much useful, new information for your daily practice. The committee, with the cooperation of the Section Officers, has made progressive changes in the format by developing seminars, roundtable discussions, and clinical conferences and postgraduate courses.

GENERAL INFORMATION

MSMS OFFICE — Ontario Room, Fifth Floor, Sheraton-Cadillac Hotel

Hours: 8:00 a.m. to 5:00 p.m. each day.

MSMS MESSAGE CENTER — Check Room on the Fourth Floor (313/961-8000, Ext. 2948 and 2949)

Special lines will be installed for local and long distance telephone calls for registrants and exhibitors at the MSMS meeting.

CHECK THE MESSAGE CENTER BOARD REGULARLY FOR POSTED MESSAGES.

ANNUAL SESSION PROGRAM COMMITTEE — Alexander J. Walt, MD, Chairman, Detroit; T. A. Baker, MD, West Branch; W. C. Baum, MD, Grand Rapids; K. H. Johnson, MD, Lansing; A. M. Lerner, MD, Detroit; F. P. Rhoades, MD, Detroit; H. A. Towsley, MD, Ann Arbor; F. B. Bicknell, MD, Detroit; G. L. Brinkman, MD, Detroit; T. N. Evans, MD, Detroit; W. S. Haubrich, MD, Detroit; R. F. Wilson, MD, Detroit, and Neal A. Vanselow, MD, Ann Arbor.

MSMS NEWS ROOM — Michigan and Windsor Rooms, Sheraton-Cadillac Hotel

Hours: 8:00 a.m. to 5:00 p.m., each day.

TICKETS for the daily general luncheons, and other functions of related groups and sections will be available at the registration desk.

NO REGISTRATION FEE required for members of MSMS and other state medical associations, the AMA or the Canadian Medical Association.

ADMISSION to all meetings in the Sheraton-Cadillac Hotel and to the exhibits will be by badge only. Please present MSMS, other state medical association, AMA, or CMA membership card to expedite registration. This will save your time.

Interns, residents, medical students, and nurses are welcome to attend the scientific meetings.

DAILY GENERAL LUNCHEON for all registrants and speakers on Wednesday and Thursday. Tickets may be purchased at the registration desk. The cash bar and the luncheon area is open noon - 2:00 p.m.

INTERMISSIONS TO VIEW THE EXHIBITS will be provided on Wednesday and Thursday in the morning from 10 to 10:45 and in the afternoon from 3:15 to 4.

PAPERS WILL BEGIN AND END ON TIME — Believing there is nothing which makes a scientific meeting more attractive than by-the-clock promptness and regularity, all meetings will open exactly on time, all speakers will be required to begin their papers exactly on time and to close exactly on time in accordance with the programmed schedule. All who attend the meeting, therefore, are requested to assist in attaining this end by noting the schedule carefully and attending accordingly.

AAGP CREDIT: Members of the Michigan Academy of General Practice will receive credit for each hour they attend the 1968 Annual Session. Application for approval should be made to James Dooley, MD, Chairman, Commission on Education, 3210 S. Dort Highway, Flint.

NEW INFORMATION IN THE EXHIBIT

MSMS is proud to present an outstanding technical exhibit at its 103rd Annual Session.

All physicians are urged to visit the educational displays, to take advantage of the new information available, and also to express appreciation for the exhibitors' contributions to the MSMS postgraduate program.

MEETINGS OF RELATED GROUPS

WOMAN'S AUXILIARY CONVENTION: Tuesday through Thursday, September 24-26, Statler-Hilton Hotel.

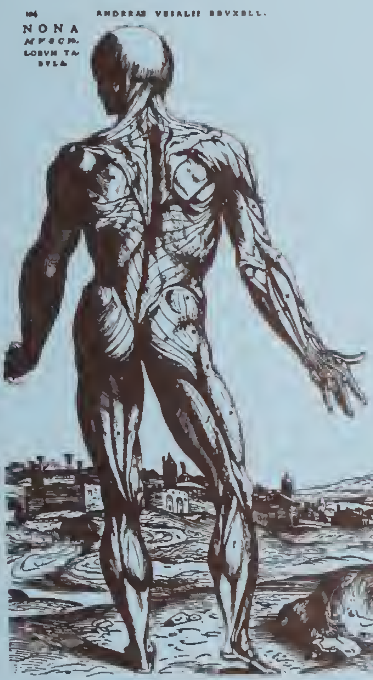
MICHIGAN STATE MEDICAL ASSISTANTS SOCIETY CONVENTION: Tuesday through Thursday, September 24-26, Pontchartrain Hotel.

ALUMNI GROUPS:

The University of Michigan Medical Center Alumni Society will entertain in a hospitality suite Monday, September 23 from 4:30 to 6:00 p.m., Tuesday, September 24 from 11:30 a.m. to 12:30 p.m., and Wednesday, September 25 from 4:30 to 6:00 p.m.

The Wayne State University will entertain in a hospitality suite at the Sheraton-Cadillac Hotel on Tuesday and Wednesday, September 24 and 25, 1968. There will be a Reception in the Suite on Wednesday evening from 4:00 to 6:00 p.m. and Alumni, Faculty, and ex-Residents and Interns, with their spouses are cordially invited to attend. The Hospitality Suite will be open from 11:00 a.m. to 6:00 p.m. on both Tuesday and Wednesday and representatives of the Alumni Association and the School will be on hand to extend a most cordial welcome to visitors.

The Yanderbilt Alumni Association will hold a reception on Wednesday, September 25, from 6:30 p.m. to 8:00 p.m. in the West Room of the Sheraton-Cadillac Hotel. All members and their wives are invited.



All registrants at the MSMS Annual Session are cordially invited to visit the Detroit Institute of Arts to see the "Ars Medica" exhibit of more than 130 original prints about medicine. The above woodcut is attributed to the workshop of Titian (Italian, 1477-1576).

WEDNESDAY, SEPTEMBER 25

(See Page 1156 for Section Meetings)

MDPAC CONGRESSIONAL BREAKFAST: 7:30 a.m., breakfast meeting, Woodward Room, Sheraton-Cadillac Hotel. Tickets may be secured in advance by writing Michigan Doctors Political Action Committee, P.O. Box 169, East Lansing 4882[illegible] Cost is $4.00. The speakers will be Rep. John Conyers, Jr., (D), Detroit, and Rep. Donald W. Riegle, Jr., (R), Flint.

DETROIT ROENTGEN RAY SOCIETY and the MSMS SECTION ON RADIOLOGY: 6:00 p.m. reception, 7:00 p.m. dinner-meeting in the English Room (mezzanine floor). The speaker is Manuel Viamonte, Jr., MD, Miami, Florida, who will talk on "Lymphatic System."

MICHIGAN BRANCH, AMERICAN ACADEMY OF PEDIATRICS: 5:00 p.m. reception, 6:00 p.m. dinner-meeting at the Statler-Hilton Hotel. The Speaker is Leo Stern, MD, of Montreal, Canada, who will talk on "What's New with Hyperbilirubinemia."

MICHIGAN SOCIETY OF ANESTHESIOLOGISTS: Co-sponsors the general meeting on "Relief of Pain" from 4:00 p.m. to 5:00 p.m. and the Thursday Round Table Discussion on "Anesthesiology - 1975" from 7:30 a.m. to 8:45 a.m.

THURSDAY — NEXT PAGE

THURSDAY, SEPTEMBER 26

(See Page 1166 for Section Meetings)

MICHIGAN SOCIETY OF PSYCHIATRY AND NEUROLOGY: Meets with the Section on Psychiatry and Neurology for a reception and dinner-meeting beginning at 6:00 p.m. in the Woodward Room (fifth floor). The speaker is Professor John C. Burnham of Columbus, Ohio, who will talk on "American Medicine and the Development of an American Style in Psychiatry."

Spouses are invited to attend the reception and dinner.

MICHIGAN ASSOCIATION OF NEUROLOGICAL SURGEONS: Will meet with the Section on Neurological Surgeons for a reception and dinner-meeting beginning at 5:30 p.m. in Room 615 and the Boulevard Room (sixth floor). The speaker is Mr. Neal L. McCue, Detroit, who will talk on "The Neurosurgeon and Blue Shield."

DETROIT UROLOGICAL SOCIETY: Co-sponsors the Round Table Discussion on "Malignancies of the Genito-Urinary Tract" from 7:30 a.m. to 8:45 a.m. and the General Meeting on "Prostate Carcinoma" from 9:00 a.m. to 10:00 a.m.

MICHIGAN DIABETES ASSOCIATION: Co-sponsors the General Meeting on "Diabetes" from 2:00 p.m. to 3:15 p.m.

MICHIGAN ORTHOPAEDIC SOCIETY: Meets with the Section on Orthopedic Surgery beginning at 4:00 p.m. and followed by a reception and dinner in the Sheraton Room (fifth floor). The speaker is Ignacio V. Ponseti, MD, of Iowa City who will discuss "Studies of Trunk Growth in Normal Children and in Children with Growth Disorders."

MICHIGAN SOCIETY OF PATHOLOGISTS: Meets with the Section on Pathology from 9:30 a.m. to 5:00 p.m. A slide seminar on "Diseases of Skeletal Muscle" will be presented by William K. Engel, MD, Bethesda, Maryland, in the Woodward Room at 1:30 p.m.

The Business Meeting will be at 9:30 a.m. in the Washington Room; luncheon will be at 12:00 noon in the Woodward Room; a cash bar will be set up in the Book-Casino at 7:00 p.m.; and the Past Presidents Dinner is at 7:00 p.m. in the Book-Casino Room.

OFFICE MANAGEMENT SEMINAR FOR NEW PHYSICIANS, RESIDENTS, INTERNS, AND STUDENTS: Offered from 3:00 to 5:30 p.m.,Thursday, September 26 for newly-practicing physicians, residents, interns, and senior medical students.

Breakfast Roundtable Discussions
7:30 - 8:45 am
(Continental Breakfast served to all in attendance)

Wednesday

Sheraton Room
Fifth Floor

Use of the Laparoscope

Alfred I. Sherman, MD, Professor of Gynecology and Obstetrics, Wayne State University School of Medicine

Sponsored by Section on Obstetrics-Gynecology
Chairman: John P. Ottaway, MD, Grosse Pte. Farms
Secretary: Herman C. Eldersveld, MD, Grand Rapids

Business Meeting of Section on Obstetrics-Gynecology

Thursday

Washington Room
Fifth Floor

Malignancies of the Genito-Urinary Tract

George T. Mellinger, MD, Minneapolis, Chief of Urology Service, Veterans Administration Hospital; Chairman, Veterans Administration Cooperative Urological Research Group; and, Associate Professor of Urology, University of Minnesota

Willet F. Whitmore, Jr., MD, New York, Chief, Urologic Service, Memorial Hospital for Cancer and Allied Diseases; Clinical Professor of Surgery (Urology) Cornell Medical College

Sponsored by the Section on Urology and the Detroit Branch, American Urological Society.
Chairman: Edward J. Shumaker, MD, Detroit
Secretary: James M. Pierce, Jr., MD, Detroit

Business Meeting of Section on Urology

Sheraton Room
Fifth Floor

Treatment of Recurrent Carcinoma of the Colon and Rectum

Edward L. Moorhead, MD, Grand Rapids, Chief, Division of Medical Oncology, Butterworth Hospital

Sponsored by the Section on Proctology
Chairman: John R. Heaton, MD, Grand Rapids
Secretary: George Kinsley, MD, Pontiac

Business Meeting of Section on Proctology

Mason Room
Fifth Floor

Anesthesiology — 1975 — What Is It Or Through The Eye of The Needle

John W. Ditzler, MD, Chicago, Director, Department of Anesthesiology, Chicago Wesley Memorial Hospital; Professor of Anesthesiology, Northwestern University Medical School

Sponsored by the Section on Anesthesiology and the Michigan Society of Anesthesiologists, Inc.
Chairman: Shirley Austin, MD, Detroit
Secretary: Ralph E. Bauer, MD, Detroit

Wednesday Morning, September 25

Choose from Two Concurrent General Sessions

LECTURES ABOUT BREAST CARCINOMA

Ballroom B
(Fourth Floor)

9:00 - 10:00

BREAST CARCINOMA

Moderator: Alexander J. Walt, MD, Assistant Dean Wayne State University School of Medicine, Professor and Chairman, Department of Surgery, Wayne State University School of Medicine

The Problems and Aspects of Cure—Mammography and Xerography

John A. Wolfe, MD, Chairman, Department of Radiology Hutzel Hospital; Assistant Clinical Professor, Department of Radiology, Wayne State University School of Medicine

Xerograms of the breast have the following advantages over film mammograms:

1. They are easier to interpret
2. They require less radiation to produce than Eastman Kodak "M" film mammograms.
3. Xerograms afford greater detail.
4. The process is dry.
5. The finished product is obtained quickly and with great ease.

The most important feature is that they are easier to interpret. Properly set-up xerograms could probably be "read" in a screening program at the rate of 4-5 cases per minute whereas experience with film mammography in such a program revealed an ability of 15-20 cases per hour. An additional advantage of xerography is that all parts of the breast are clearly shown with one image.

The essential part of xerography is the "plate" which consists of a sheet of aluminum 10 x 17 inches coated with a thin layer of selenium and encased in a wooden "cassette" complete with a dark slide to protect it from light. The plate is used as one would an x-ray film.

A positive charge is placed on the selenium surface. X-rays make the selenium conductive perpendicularly. After exposure there is a residual charge pattern which may be made visible by "developing" with a negatively charged pigment containing powder.

Xerography is a simpler method of examination of the breast as compared to that done with conventional x-ray film. It is my belief more information can be obtained from a single xerogram than any single film mammogram. With a good technique xerography will afford a more accurate examination; but most important, it is more readily interpreted. The development awaits reliable equipment.

Indications and Results of Chemotherapy in the Management of Breast Cancer

Vainutis K. Vaitkevicius, MD, Associate Professor and Director of Oncology, Wayne State University School of Medicine

---

10:00 - 10:45

Intermission to View the Exhibits

Ballroom A
(Fourth Floor)

9:00 - 10:00

SELECTIVE ABDOMINAL ARTERIOGRAPHY

Moderator: Roger L. Rian, MD, Associate Radiologist, Henry Ford Hospital

Angiography in Liver Diseases, Splenic Pathology, Pancreatic, Gastric, Small and Large Bowel and Renal Diseases

Manuel Viamonte, Jr., MD, Department of Radiology, School of Medicine, University of Miami

10:00 - 10:45

Intermission to View the Exhibits

Wednesday Morning, September 25

Choose from Two Concurrent General Sessions

MORE LECTURES ABOUT BREAST CARCINOMA

Ballroom B
(Fourth Floor)

10:45 - 12:00

(Continuation of Breast Carcinoma)

Aspects of Palliation
Surgical Aspects of Palliation

William J. Fry, MD, Professor and head, Section of General Surgery, University of Michigan Medical School

The Place of Radio Therapy in Carcinoma of the Breast

Doctor M. Betty Bennett, Capetown, South Africa, Senior Radio Therapist, Department of Radiotherapy, Groote Schuur Hospital, and Senior Lecturer, University of Capetown

Approach to Surgery of the Potentially Curable Case

Cushman D. Haagensen, MD, New York City, Department of Surgery, College of Physicians and Surgeons of Columbia University

William L. Donegan, MD, Surgeon, Ellis Fischel State Cancer Hospital and Assistant Professor of Surgery, University of Missouri School of Medicine

---

All registrants are invited to General Luncheon

Ballroom A
(Fourth Floor)

10:45 - 12:00

PROBLEMS OF THE FETUS

Chairman: George E. LaCroix, MD, Associate Professor of Obstetrics and Gynecology, Wayne State University School of Medicine

Problems of the Fetus

Robert H. Usher, MD, Montreal, Quebec, Assistant Professor of Pediatrics and Obstetrics and Gynecology, McGill University

Pre and Postnatal Resusitation

John P. Harm, MD, Instructor in Pediatrics, Department of Pediatrics, Wayne State University School of Medicine

---

12:00 - 2:00

Woodward Room
(Fifth Floor)

GENERAL LUNCHEON

Chairman: James J. Lightbody, MD, President-Elect Michigan State Medical Society

Report of 1968 of MSMS House of Delegates

Kenneth H. Johnson, MD, Lansing, Secretary

Drugs, Doctors and Government

Harry F. Dowling, MD, Chicago, Professor and Head, Department of Medicine, University of Illinois College of Medicine

Wednesday Afternoon, September 25

Choose from Two Concurrent General Sessions

LECTURES ABOUT TRAUMA

Ballroom B
Sponsored by the Section on Surgery.

Chairman:
Robert O. Northway, MD, Saginaw

Secretary: Joseph A. Witter, MD, Highland Park

2:00 - 3:15

TRAUMA

Moderator: Paul W. Gikas, MD, Ann Arbor, Chief Laboratory Service, Veterans Administration Hospital

The program will be devoted to a discussion of some of the problems associated with the immediate care and transportation of the acutely injured patient. The inadequacies of emergency medical services in general will be emphasized and the role of the physician in solving some of the problems will be stressed.

Needed Changes in Emergency Health Care

J. Cuthbert Owens, MD, Denver, Professor of Surgery, University of Colorado Medical Center

The Extrication of Injured Personnel from Wrecked Vehicles

Louis C. Kossuth, Colonel, USAF, MC, Command Surgeon, United States Air Force, Aerospace Defense Command, Colorado

---

3:15 - 4:00

INTERMISSION TO VIEW THE EXHIBITS

Ballroom B
(Fourth Floor)

4:00 - 5:00

(CONTINUATION OF TRAUMA)

Panel on "The Management of a Patient with Multiple Injuries

Moderator: Robert F. Wilson, MD, Professor of General Surgery, Wayne State University School of Medicine

Paul W. Gikas, MD, Ann Arbor, Chief, Laboratory Service, Veterans Administration Hospital

Harvey Y. Lewis, MD, Associate Professor of Urology, Wayne State University School of Medicine

J. Cuthbert Owens, MD, Denver, Colorado, Professor of Surgery, University of Colorado Medical Center

L. Murray Thomas, MD, Clinical Professor and Assistant Chairman, Department of Neurosurgery, Wayne State University

Business Meeting of the Section on Surgery

Book Casino
(Lobby Floor)

5:00 - 6:00

Fireside Discussions with Speakers

Grand Ballroom
Fourth Floor

6:00 - 8:30

PRESIDENTS PARTY

Reception, Buffet, Two Bands for Dancing

Sponsored by MSMS for all registrants, exhibitors and for members of the Auxiliary and Medical Assistants

Ala Carte Cocktails

OR LECTURES ABOUT PEDIATRICS, AND PAIN

Ballroom A
(Fourth Floor)

Sponsored by the Section on Pediatrics.

Chairman:
Anthony C. Gholz,
MD, Port Huron

Secretary:
John L. Doyle,
MD, Grand Rapids

2:00 - 3:15

PEDIATRIC PROBLEMS

Program Chairman: William J. Oliver, MD, Professor of Pediatrics and Communicable Diseases and Chairman of the Department of Pediatrics and Communicable Diseases, University of Michigan Medical School

The Management of Respiratory Failure in the Newborn

Leo Stern, MD, Montreal, Canada, Director of the Neonatal Intensive Care Unit, Montreal Children's Hospital; and, Assistant Professor of Pediatrics, McGill University Faculty of Medicine

The Diagnosis and Management of Infections in the Newborn

Joseph V. Baublis, MD, Assistant Professor of Pediatrics, University of Michigan Medical School and Lecturer, School of Public Health

Business Meeting of the Section on Pediatrics

3:15 - 4:00

Intermission to View the Exhibits

Ballroom A

Sponsored by the Section on Anesthesiology and the Michigan Society of Anesthesiologists, Inc.

Chairman:
Shirley Austin,
MD, Detroit

Secretary:
Ralph E. Bauer,
MD, Detroit

4:00 - 5:00

RELIEF OF PAIN

Moderator: Shirley Austin, MD, Detroit

John W. Ditzler, MD, Chicago, Director, Department of Anesthesiology, Chicago Wesley Memorial Hospital; Professor of Anesthesia, Northwestern University Medical School

He will attempt to emphasize that nearly all doctors hear of the complaint of pain daily, that nearly all of us experience "pain" to one degree or another, and that when pain is not ordinarily relieved by the obvious removal of a cause or by standard medications that the difficulties of therapy begin primarily often on an iatrogenic basis. It will be pointed out further that patients with known organic causes for pain frequently develop such serious functional overlays that proper psychotherapy often becomes impossible. Patients frequently rebel and reject the competent services of psychiatrists; physicians who inject various medications into painful areas frequently fail because of an inopportune patient-physician relationship. While not all anesthesiologists desire or are equipped to handle complex problems in the relief of pain, it is, however, suggested that this is an area where the anesthesiologist may provide a service not elsewhere available.

Business Meeting of the Section on Anesthesiology

BOOK CASINO
(Lobby Floor)

5:00 - 6:00

Fireside Discussions with Speakers

ALL REGISTRANTS, WIVES INVITED TO PRESIDENTS PARTY

Wednesday, September 25
Meetings of Sections and Related Groups

10:45 am - 12 noon
Boulevard & Room 615
(Sixth Floor)

Section on Dermatology

Chairman: Ralph J. Cosky, MD, Oak Park
Secretary: Earl J. Rudner, MD, Detroit

Panel presentation on "Oral Mucous Membrane Lesions"

Henry G. Bryan, MD, Detroit, Clinical Instructor, Wayne State University School of Medicine

Myron Kaufman, D.D.S., Detroit, Diplomate, American Board of Oral Surgery; Attending Oral Surgeon, Sinai Hospital

This discussion will deal with common lesions of the oral mucosa, classified according to their most pronounced clinical appearance. It will attempt to assist the clinician in differentiating the various oral diseases that produce white lesions, ulcerative lesions, tumefactions, and so forth. It is hoped that it will also enhance his diagnostic possibilities, so that in examining a lesion, his list of differential diagnoses will be increased.

Edward A. Krull, MD, Physician, Department of Dermatology, Henry Ford Hospital

Amir H. Mehregan, MD, Clinical Assistant Professor of Dermatology, Wayne State University School of Medicine

---

12 noon to 2:00 pm
luncheon - meeting
English Room
(Mezzanine)

Section on Plastic Surgery

Chairman: Alexander P. Kelly, MD, Detroit
Secretary: Joseph H. Naud, MD, Detroit

Surgery of the Parotid Gland

Robin Anderson, MD, Cleveland, Head, Department of Plastic Surgery, Cleveland Clinic

All registrants at the Convention are most welcome to attend.

2:00 - 3:15 pm
Washington Room
(Fifth Floor)

Section on Public Health and Preventive Medicine

Chairman: Gordon A. Eadie, MD, Newberry
Secretary: Maurice S. Reizen, MD, Lansing

Medicare and Medicaid — Their Impact
- - - From the Viewpoint of the Medical Care Administrator

Avedis Donabedian, MD, Professor of Medical Care Organization, School of Public Health, University of Michigan

This presentation will deal with the actual and expected impacts of Medicare and Medicaid (mainly the former) on the medical care system as a whole including: Public acceptance and participation, use of service, prices and expenditures, degree of consumer protection, the quality of care, health insurance, hospitals and related facilities and public welfare medical care.

- - - From the Viewpoint of the Private Practitioner

Beverly C. Payne, MD, Ann Arbor, Assistant Dean, University of Michigan Medical School and Clinical Assistant Professor in Internal Medicine, University of Michigan Medical School

4:00 pm meeting
5:30 Reception
Sheraton Room
(Fifth Floor)

Section on Otolaryngology

Chairman: Paul J. Dzul, MD, Detroit
Secretary: Christian Helmus, MD, Grand Rapids

Pediatric Problems in Otolaryngology

Herbert G. Birck, MD, Columbus, Ohio, Clinical Professor Ohio State University, Chief, Department of Otorhinolaryngology, Children's Hospital

Chairman: Edwin M. Smith, MD, Ann Arbor
Secretary: George H. Koepke, MD, Ann Arbor

Reception and Organizational Meeting (No Speaker)

4:00 pm meeting
Room 615
(Sixth Floor)

Section on Ophthalmology

Chairman: James L. Frey, MD, Southfield
Secretary: Raymond A. Pinkham, MD, Kalamazoo

"Analysis of Overcorrected Exotropia"

Robert J. McDonald, MD, Royal Oak

4:00 pm
Boulevard Room
(Sixth Floor)

Section on Allergy and Applied Immunology

Chairman: Julius J. Greenberg, MD, Southfield
Secretary: Jack M. Lesesne, MD, Grosse Pointe

Mechanisms of Immunologic Tissue Injury

David Hawkins, MD, Medical Research Council of Canada, Scholar; Assistant Professor of Medicine, McGill University, Montreal, Quebec, Canada

Several experimental models of immunologic disease which bear certain resemblances to human autoimmune and collagen-vascular diseases will be discussed. The elucidation of some of the mechanisms of tissue injury in these experimental models give some insight as to how similar processes could result in human disease. The focal point of the discussion will be the injury to vascular and modified vascular tissues such as the glomerulus.

5:00 pm reception
6:00 pm dinner
Statler-Hilton

Michigan Branch, American Academy of Pediatrics

What's New With Hyperbilirubinemia

Leo Stern, MD, Montreal, Canada

6:00 pm
East Room
(Fifth Floor)
reception

Lymphatic System

Manuel Viamonte, Jr., MD, Miami, Florida, Department of Radiology, University of Miami School of Medicine

Thursday Morning, September 26

Choose from Two Concurrent General Sessions

LECTURES ABOUT PROSTATE CARCINOMA

Ballroom A

9:00 - 10:00

PROSTATE CARCINOMA

Moderator: Edward J. Shumaker, MD, Chief, Division of Urology, Harper Hospital and Assistant Clinical Professor, Wayne State University Medical School

George T. Mellinger, MD, Minneapolis, Chief of Urology Service, Veterans Administration Hospital; Chairman, Veterans Administration Cooperative Urological Research Group; and Associate Professor of Urology, University of Minnesota

Presentation of the latest figures and conclusions from the cooperative study on cancer of the prostate by the Veterans Administration Cooperative Urological Research Group.

Willet F. Whitmore, Jr., MD, New York City, Chief, Urologic Service, Memorial Hospital for Cancer and Allied Diseases; Clinical Professor of Surgery (Urology) Cornell Medical College

The natural history of prostatic cancer and the influence of endocrine therapy on the survival of the patients with prostatic cancer.

10:00 - 10:45

Intermission to View the Exhibits

Ballroom B
(Fourth Floor)

Sponsored by
the Section on
Internal Medicine.

Chairman:
John B. Bryan,
MD, Royal Oak

Secretary:
John R. Caldwell,
MD, Detroit

9:00

CARDIOVASCULAR DISEASES

Program Chairman: Richard J. Bing, MD, Professor and Chairman, Department of Medicine, Wayne State University School of Medicine

Pulmonary Embolus

Park W. Willis III, MD, Professor of Internal Medicine, University of Michigan Medical School

9:30

General Pediatric Care in Relation to Prognosis of Infants with Congenital Heart Disease

Charlotte I. Ferencz, MD, Associate Professor of Pediatrics, State University of New York at Buffalo, New York

Cardiac infants need more general care than normal babies. This may make all the difference to the timing and success of corrective surgery and at times the necessity for surgical interference may be avoided. In this day of technical advances the pediatrician and practitioner often feels that only the specialist can contribute significantly to the care of these babies. The major pathophysiologic problems of infants will be discussed, with "warning signs" and guidelines for successful management.

10:00

The Effect of Nicotine and Alcohol on the Heart

Richard J. Bing, MD, Professor and Chairman, Department of Medicine, Wayne State University School of Medicine

Thursday Morning, September 26

Choose from Two Concurrent General Sessions

LECTURES ABOUT CALCIUM

Ballroom A
(Fourth Floor)

10:45 - 12:00

CALCIUM — TOO MUCH - TOO LITTLE

Moderator: Richmond W. Smith, MD, Chairman, Department of Medicine Henry Ford Hospital

The panel will discuss regulatory mechanisms for serum calcium, the causes and significance of hypocalcemia and hypercalcemia, the actions and interactions and parathyroid hormone, calciotonin thyroxin, vitamin D, etc., and the best means to control the severe hypercalcemic state.

Louis V. Avioli, MD, St. Louis, Missouri, Director, Division of Endocrinology, the Jewish Hospital of St. Louis and Associate Professor of Medicine, Washington University School of Medicine.

Robert D. Johnson, MD, Associate Professor of Internal Medicine and Postgraduate Medicine, University of Michigan Medical School.

Boy Frame, MD, Physician-in-Charge, Fifth Medical Division, Henry Ford Hospital

The various mechanisms that control calcium metabolism normally and in various pathalogic states will be discussed with emphasis on recent developments relating to the physiology of parathyroid hormone and thyrocalcitonin.

All registrants are invited to General Luncheon

10:30

Cardioversion

Robert A. England, MD, Boston, Assistant in Medicine, Peter Bent Brigham Hospital, Research Fellow, Harvard School of Public Health

11:00

Round Table Discussion on "Coronary Artery Disease, It's Mechanisms and Treatment"

Topics: The Coronary Care Unit and Its Use
The Treatment of Cardiogenic Shock
The Prevention of Coronary Artery Disease
Epidemiology of Coronary Artery Disease

Discussants:

Moderator: Richard J. Bing, MD, Professor and Chairman, Department of Medicine, Wayne State University School of Medicine

Raymond S. Kurtzman, MD, Associate Professor of Radiology, Wayne State University School of Medicine

Erwin Robin, MD, Assistant Professor of Medicine, Wayne State University School of Medicine

Raymond E. Fuller, MD, Grand Rapids, Chairman, Cardiovascular Laboratory

Jack M. Kaufman, MD, Detroit, Associate Professor of Internal Medicine, Wayne State University School of Medicine; Chief of Cardiology and Internal Medicine, Harper Hospital; Attending Cardiologist, Beaumont Hospital

Leon D. Ostrander, Jr., MD, Associate Professor of Internal Medicine, University of Michigan Medical School

Agustin Arbulu, MD, F.A.C.S., Associate Professor in Surgery, Wayne State University School of Medicine

Business Meeting of the Section on Internal Medicine

12:00 - 2:00

English Room
(Mezzanine Floor)

GENERAL LUNCHEON

Chairman: Alexander J. Walt, MD, Assistant Dean Professor and Chairman, Department of Surgery, Wayne State University School of Medicine

Clinical Organ Transplantation

David Hume, MD, Richmond, Virginia, Stuart McGuire Professor and Chairman, Department of Surgery, Medical College of Virginia

Thursday Afternoon, September 26

Choose from Two Concurrent General Sessions

LECTURES ABOUT DIABETES

Ballroom A
(Fourth Floor)
Joint Meeting
with the Michigan
Diabetes Association

2:00 - 3:15

DIABETES

Moderator: Fred W. Whitehouse, MD, Division of Metabolic Diseases, Henry Ford Hospital

Pathophysiology of Acute Metabolic States in Diabetes

Buris R. Boshell, MD, Birmingham, Alabama, Ruth Lawson Hanson Professor of Medicine and Professor of Medicine of the University of Alabama Medical Center

A discussion of the pathophysiology of ketosis, ketoacidosis, lactic acidosis, and hyperosmolar coma.

Panel Presentation on "Diabetic Coma and the Diabetic in Coma"

Moderator: Fred W. Whitehouse, MD, Division of Metabolic Diseases, Henry Ford Hospital

Panelists:

Buris R. Boshell, MD, Birmingham, Alabama, College of Alabama

John B. Bryan, MD, Royal Oak

Richard D. Hohl, MD, Associate Physician, Division of Metabolic Diseases, Henry Ford Hospital

Lawrence H. Power, MD, Associate Professor of Medicine, Wayne State University School of Medicine

WHAT'S NEW IN THE PRACTICE OF - - - - ?

Moderator: Alexander J. Walt, MD, Assistant Dean, Professor and Chairman, Department of Surgery, Wayne State University School of Medicine

"- - - - Cardiovascular Diseases"

Richard J. Bing, MD, Professor and Chairman, Department of Medicine, Wayne State University School of Medicine

"- - - - Cancer"

Michael J. Brennan, MD, Medical and Scientific Director, The Michigan Cancer Foundation and Professor of Medicine, Wayne State University School of Medicine

The new developments in cancer chemotherapy, which attempt to utilize combinations of chemotherapeutic agents and knowledge of the fundamental cellular effects of these agents together with information on tumor doubling times and cell cycle times to attain optimal results in clinical cancer work.

"- - - - Transplantation"

David Hume, MD, Richmond, Virginia, Chairman, Department of Surgery, Medical College of Virginia

"- - - - Urology"

George T. Mellinger, MD, Minneapolis, Chief of Urology Service, Veterans Administration Hospital; Chairman, Veterans Administration Cooperative Urological Research Group; and Associate Professor of Urology, University of Minnesota

Willet F. Whitmore, Jr., MD, New York City, Chief, Urologic Service, Memorial Hospital for Cancer and Allied Diseases; Clinical Professor of Surgery (Urology), Cornell Medical College

"- - - - Gynecology"

Samuel J. Behrman, MD, Ann Arbor, Director, Center for Research in Reproductive Biology, University of Michigan and Professor of Obstetrics-Gynecology, Department Obstetrics-Gynecology, University of Michigan Medical School

---

3:15 - 4:00

Intermission to View the Exhibits

See Page 1164 for "Office Management Seminar"

Thursday Afternoon, September 26

Choose from Two Concurrent General Sessions

LECTURES ABOUT AGING

Ballroom A
(Fourth Floor)

4:00 - 5:00

PSYCHIATRIC PROBLEMS OF THE AGING POPULATION

Moderator: Lawrence Koltonow, MD, Southfield, Chairman, Committee on Aging, Michigan Society of Psychiatry and Neurology

Speaker: Henry W. Brosin, MD, Pittsburgh, Professor and Chairman, Department of Psychiatry, University of Pittsburgh School of Medicine; Director, Western Psychiatric Institute and Clinic

Discussants:

Lawrence Koltonow, MD
Hubert Miller, MD, Detroit, Member, Committee on Aging, Michigan Society of Psychiatry and Neurology
Marvin Sherman, MD, Detroit, Member, Committee on Aging, Michigan Society of Psychiatry and Neurology
Robert E. Walden, MD, Detroit, Member, Committee on Aging, Michigan Society of Psychiatry and Neurology

---

THURSDAY, SEPTEMBER 26

3:00 - 5:30

OFFICE MANAGEMENT SEMINAR

English Room
Mezzaine

Presiding: Norman D. Henderson, MD, East Lansing, Chairman, MSMS Liaison Committee with Residents, Interns and Senior Medical Students

How to Set Up and Run an Efficient Office
C. Allen Willmar, Saginaw, Professional Management

How to Hire and Train Employees
Charles V. Brown, Detroit, Professional Management

To Solo or Not to Solo
John K. Hoffman, Grand Rapids, Professional Management

OR MORE ABOUT "WHAT'S NEW IN THE PRACTICE OF —"

Ballroom B
(Fourth Floor)

4:00 - 5:00

"- - - - G-I Tract Diseases"

J. Edward Berk, MD, Orange, California, Professor and Chairman, Department of Medicine, University of California

"- - - - Infections and Antibiotics"

A. Martin Lerner, MD, Professor of Medicine, Wayne State University School of Medicine

"- - - - Pediatrics"

Charles F. Whitten, MD, Detroit, Associate Professor of Pediatrics and Program Director of The General Clinical Research Center for Children, Wayne State University School of Medicine

"- - - - Endocrine Diseases"

Raymond C. Mellinger, MD, Chief, Division of Endocrinology, Henry Ford Hospital

Precise diagnostic methods for the pituitary hormones by radioimmunoassay and the steroid hormones by iostope displacement assay provide major new tools for endocrine diagnosis. Increasing availability of purified pituitary hormones is the basis for significant improvement in endocrine treatment. These advances in diagnosis and treatment will be discussed in terms of specific glandular disorders.

Continuation of Seminar Program:

What Shall I Do with the Money I Earn?

R. Timothy Hogan, Ann Arbor, Professional Management

A New Billing and Collection Plan

Carl G. King, Jr., Saginaw, The Doctors' Business Bureau

Social Hour, Sponsored by MSMS, to Follow

(The Seminar is made possible by a grant from the Merck, Sharp and Dohme Postgraduate Program)

Meetings of Sections and Related Groups

Thursday

9:30 am
Washington Room

Section on Pathology and The Michigan Society of Pathologists

Section on Occupational Medicine

Chairman: Richard W. Prior, MD, Flint
Secretary: Paul E. Derleth, MD, Ferndale

Capacitance Respirometry — A New Method of Measuring Lung Impairment

Robert E. Barrow, Ph.D., Detroit, Postgraduate Fellow, U.S.P.H.S.

A new and simple method has been devised which measures pulmonary volumes and flow rates without the added errors due to the friction and air flow resistance of conventional respirometers. The capacitance respirometer detects changes in the surface area of the rib cage and abdomen during respiration and these data are recorded as respiratory volumes. Pulmonary function data are quickly obtained with a minimum of psychological error. This method has the further advantage of permitting measurements while the subject is fully dressed.

The volumes (T.V., E.R.V., I.R.V.), capacities (V.C., I.C.) and flow rates now measured by conventional instrumentation can be accurately measured and recorded with this technique.

2:00 pm
Washington Room
(Fifth Floor)

Section on Thoracic Surgery

Chairman: Cameron Haight, MD, Ann Arbor
Secretary: Raymond J. Barrett, MD, Detroit

2:00 pm

Business Meeting

2:30 pm

A Practical Approach to Carcinoma of the Lung

Lyman A. Brewer III, MD, Clinical Professor of Surgery, University of California

Carcinoma of the lung, the most common cancer in males, is increasing at an alarming rate and has passed pulmonary tuberculosis as a cause of death. From analysis of a large series of personal cases it is certain that early detection and resection currently offer the best opportunity for long-term survival of the patient. Since bronchoscopy is diagnostic in only 25% of the patients, early detection depends upon correct interpretation of chest roentgenograms and proper follow-up investigation. The author's topographical classification of carcinoma of the lung which consists of main bronchus, 24%; lobar bronchus, 54%; midlung and subpleural, 11% each, offers a practical approach to early recognition. The discussion will cover diagnosis and treatment and define the role of thoracotomy. Of the patients who have had pulmonary resection, 50% of the midlung, approximately 25% of the lobar and main bronchus, and 10% of the subpleural resections have had "5-year cures".

4:00 pm
Scientific Meeting

5:30 Reception

6:30 Dinner
Sheraton Room
(Fifth Floor)

Section on Orthopedic Surgery and the Michigan Orthopaedic Society

Chairman: H. Ross Hume, MD, Detroit

Secretary: George D. Stilwill, MD, Lansing

Studies on Trunk Growth in Normal Children and in Children with Growth Disorders

Ignacio V. Ponseti, MD, Iowa City, Professor of Orthopedic Surgery, The University of Iowa, Department of Orthopedic Surgery

Following the growth spurt of infancy, the growth rate of the extremities is fairly constant until maturity, where as the growth rate of the trunk decreases gradually until ten to twelve years of age, and then increases until sixteen years of age. The increase in growth rate in the spine and pelvis but not in the long bones, during adolescence, is related to the difference in structure of the growth plates of the vertebrae and pelvis, and the long bones.

The iliac crest is histologically similar to the vertebral rim; both ossify simultaneously and both may be considered special types of traction epiphysis or apophysis. Histological and chemical studies of iliac crest cartilage in normal children and in children with growth disorders such as achondroplasia, multiple epiphyseal dysplasia, Morquio's disease, and idiopathic scoliosis will be reported.

5:30 pm
reception and
6:30 - dinner
Boulevard Room and
Room 615

American Medicine and the Development of an American Style in Psychiatry

Professor John C. Burnham, Columbus, Ohio, Department of History, Ohio State University

A historical survey of the development of trends in American Psychiatry since about 1890, with an emphasis on the interplay between the science of psychiatry and its medical and institutional environment.

Discussant: Allen J. Enelow, MD

All-Day Postgraduate Course

Wednesday, September 25, 1968
Course on "Infectious Diseases"

East Room
Fifth Floor

8:45 *Moderator: A. Martin Lerner, MD, Professor of Medicine, Wayne State University School of Medicine*

9:00 - 9:45 **New Virus Vaccines (Respiratory, Measles, Mumps)**

Jerome O. Klein, MD, Assistant Professor of Pediatrics, Harvard Medical School; and Associate Director, Department of Pediatrics, Boston City Hospital

10:00 - 10:45 **The Extended Rubella Syndrome and Its Prophylaxis**

Mary M. Carruthers, MD, Associate in Medicine, Chicago Medical School, Mt. Sinai Hospital Medical Center

11:00 - 11:45 **Interferon and Its Clinical Application**

Thomas C. Merigan, MD, Palo Alto, Associate Professor of Medicine, Chief, Division of Infectious Diseases, Stanford University School of Medicine, Stanford Medical Center

Recovery from virus infections seem to involve several facets of host defense including antibodies, phagocytosis, interferon and the local tissue responses (acidity, heat, etc.). One of these factors, interferon, which is non-toxic but has a broad antiviral spectrum, may be useful in protecting against certain common virus infections which are caused by a wide variety of agents. Because only small amounts of interferon are available from natural sources, we have turned from its purification to a study of agents, to induce humans to make their own interferon. We have explored the action of several of these agents in man including naturally accurring and vaccine strains of human viruses, a highly attenuated animal virus not pathogenic for man, and a synthetic polycarboxylate polymer. The interferon response with each was defined and related to levels we had previously found to be active in protecting man from virus infection. Our studies will be discussed in relationship to those reported from the USSR suggesting clinical cures, with interferon induction in virus infection of respiratory tract, eye and skin. We conclude that interferon inducers have promise in prophylaxis and therapy of virus infection in man.

Luncheon Break

Continued: Course on "Infectious Diseases"

Afternoon Session *Moderator: Harry F. Dowling, MD, Chicago, Professor and Head, Department of Medicine, University of Illinois College of Medicine*

2:00 - 2:45 Antiviral Chemotherapy

Jerome A. Gold, MD, Philadelphia, Research and Development Division, Smith Kline & French Laboratories; and Clinical Assistant Professor of Medicine, Woman's Medical College of Pennsylvania

3:00 - 3:45 New Antibiotics Versus Gram-Negative Infections Including the Penicillins, Cephalosporins, Tetracyclines, and Gentamycin

Edward L. Quinn, MD, Chairman, Division of Infectious Diseases, Department of Medicine, Henry Ford Hospital

The increasing role of gram-negative infections, particularly in hospitalized patients, has been associated with the development of new antibiotics effective against these organisms. These include the broad-spectrum penicillins — ampicillin, active against many strains of *E. coli* and *Proteus mirabilis* and carbenacillin, a penicillin with increased pseudomonal activity. The synergistic effect of a combination of a penicillinase resistant penicillin, such as cloxacillin, with a penicillinase susceptible penicillin, such as ampicillin, has been demonstrated in pseudomonal urinary tract infections.

The two cephalosporins currently available must be administered by parenteral injection and have activity against coliform organisms and certain strains of Proteus. Cephalosporin derivatives effective after oral administration and active against similar gram-negative organisms are under development.

Alteration in the tetracycline molecule has resulted in compounds with prolonged activity and increased spectrum.

A new agent belonging to the basic, water soluble group of antibiotics of which neomycin and kanamycin are the prime examples, is gentamycin, a broad spectrum antibiotic with a high degree of activity against many gram-negative species, particularly Proteus and *Pseudomonas* sp.

4:00 - 4:45 Special Toxicities of Older Antibiotics, Tetracycline, Kanamycin, Colistin

Frank Cox, MD, Associate Physician, Division of Infectious Diseases, Henry Ford Hospital

Prolonged experience with certain of the older antibiotics — Tetracycline, Kanamycin, and Colistin — have brought to light certain adverse effects of these agents not originally appreciated. These, together with the well recognized reactions to these agents, must be considered in their use.

Tetracycline has been employed for many years and a number of adverse effects have been noted to be associated with its administration. These include gastrointestinal effects of nausea and diarrhea seen with declining frequency recently; the staining and mottling of teeth in infants and children; the antianabolic effect in persons with renal insufficiency; and, sudden death reported in certain people receiving large doses intravenously.

Kanamycin, when first developed, was used primarily as an antistaphylococcal agent; and, as such, was employed in large doses. Toxicity at that time was seen more frequently than at present, when more modest doses are utilized. However, ototoxicity and nephrotoxicity are still observed, particularly in older patients or those with renal insufficiency.

Colistin, closely related to polymyxin B demonstrates much the same type of toxicity. Transient paresthesias, vertigo, and ataxia are seen to be, in part, dose related. Renal toxicity has also been noted in a few patients and is more marked in patients with low renal reserve.

These well established and useful antimicrobial agents thus have potential for serious and even fatal side effects. As with any potent drug, knowledge of these side effects and measures to reduce their occurrences are essential.

All-Day Postgraduate Course

Wednesday, September 25, 1968
Course on "Pulmonary Diseases"

West Room
Fifth Floor

Chairman: Geoffrey L. Brinkman, MD, Associate Professor of Medicine, Wayne State University School of Medicine

Morning Session

Moderator: Benjamin M. Lewis, MD, Professor of Medicine, Wayne State University School of Medicine

8:45 **Management of Respiratory Failures**

Clinical Manifestation

Kaye H. Kilburn, MD, Durham, Associate Professor of Medicine, Duke University Medical Center

Followed by ten-minute discussion

9:10 **Physiology of Respiratory Failure**

Benjamin M. Lewis, MD, Professor of Medicine, Wayne State University School of Medicine

Followed by ten-minute discussion

9:40 **Treatment**

Techniques for Cleansing and Securing the Airway

Kaye H. Kilburn, MD, Durham, Associate Professor of Medicine, Duke University Medical Center

The discussion will include descriptions of the anatomy of physiology of clearance of the normal tracheobronchial tree. The elements of the mucociliary escalator and how they work; the disturbing effects of acute bronchitis, chronic bronchitis and pulmonary emphysema on this orderly mechanism, will be discussed. Next is an outline of therapy to restore, improve or enhance normal mechanisms. This is followed by methods for taking over airway function both as to clearance and for supporting ventilation. Practical and simple methods stressing fundamental good treatment will be emphasized.

The medical therapy of pulmonary embolism will be approached from the basis of understanding the functions of the pulmonary circulation and its control. It serves as a blood reservoir, a reserve of white blood cells, a biochemical factory, a distribution system and a filter for the entire blood flow. As a filter, it has the function of removing aggregates of cells until they can be broken up. A 16 mm movie strip will be shown to illustrate this function and how drugs such as heparin, low molecular weight dextran, protamine, polybrene, high molecular weight dextran and agents such as histamine, acetylcholine, morepiniphrine and isoproterenal affect small emboli. The clinical applicability of such information will be discussed.

10:20 **Assisted Ventilation**

Gordon L. Snider, MD, Professor of Medicine, Boston University School of Medicine

Correction of hypoxemia and maintenance of alveolar ventilation are essential in the successful management of respiratory failure. Methods of monitoring, techniques of control, oxygen administration and artificial assistance to ventilation will be covered.

Followed by ten-minute discussion

11:00 **Ambulatory Care**

Thomas L. Petty, MD, Denver, Associate Professor of Medicine, University of Colorado Medical Center

Followed by ten-minute discussion

11:30 *Panel Discussion: Kaye H. Kilburn, MD; Benjamin M. Lewis, MD; Thomas L. Petty, MD; Gordon L. Snider, MD; and Rodman E. Taber, MD*

Luncheon Break

Continued: Course on "Pulmonary Diseases"

Afternoon Session — *Moderator: Geoffrey L. Brinkman, MD, Professor of Medicine, Wayne State University School of Medicine*

Pulmonary Embolism

2:00 **Diagnosis — Clinical**

Thomas L. Petty, MD, Denver, Assistant Professor of Medicine, University of Colorado Medical Center

2:15 **Diagnosis — Radiological**

Manuel Viamonte, MD, Department of Radiology, University of Miami School of Medicine

Followed by fifteen-minute discussion

2:45 **Therapy — Medical**

Kaye H. Kilburn, MD, Durham, Associate Professor of Medicine, Duke University Medical Center

3:00 **Therapy — Surgical**

Rodman E. Taber, MD, Associate Surgeon, Division of Thoracic Surgery, Henry Ford Hospital

This will be a demonstration of cases showing cardiac catheterization and angiographic data. Case selection for pulmonary embolectomy will be discussed. Prevention of pulmonary embolism will be presented with emphasis on vena caval ligation and clipping. The disturbed physiology produced by vena caval ligation will be presented.

Followed by fifteen-minute discussion

Acid-Fast Infections

3:45 **Atypical Acid-Fast Infections**

Gordon L. Snider, MD, Professor of Medicine, Boston University School of Medicine

A significant proportion of admissions to hospitals for tuberculosis are due to infections with non-human or atypical mycobacteria. Intensive bacteriological studies have resulted in a better understanding of classification, identification, and epidemiology of these infections. Because of their resistance to the standard antituberculous drugs, chemotherapy requires a special approach. Representative cases will be presented.

Followed by five-minute discussion

4:20 **Prophylactic Anti-Tuberculous Chemotherapy**

Winthrop N. Davey, MD, Professor of Internal Medicine, University of Michigan School of Medicine

Followed by ten-minute discussion

All-Day Postgraduate Course

Thursday, September 26, 1968
Course on "Blood Diseases"

East Room
Fifth Floor

8:45 *Moderator: Arnold R. Axelrod, MD, Associate Professor of Clinical Medicine, Wayne State University; Chief, Hematology Division, Department of Medicine, Sinai Hospital; Consultant in Hematology, Providence and Mt. Carmel Hospitals*

9:00 **Orientation to Anemia**

Julius Rutzky, MD, Associate Professor of Pathology, Wayne State University School of Medicine

10:30 Coffee Break

11:00 **An Approach to Hemolytic Anemias**

Scott N. Swisher, MD, East Lansing, Chairman, Department of Medicine, Michigan State University College of Human Medicine

The general indicators of hemolytic processes, both primary and secondary will be discussed. The Characteristics of the most common congenital and acquired hemolytic disorders will be treated briefly and the general principal relating to the management of these problems will be considered in the light of the pathological and physiological involvement of the role of blood transfusion of that particularly emphasized.

12:30 Luncheon Break

2:15 **The Leukocytes — Differential Patterns and Relations to Leukemia**

George Clifford, MD, New York City, Director, Medical Laboratory Service, Sloan Kettering Institute

3:30 Coffee Break

4:00 **An Orientation of Platelet Diseases**

Arnold R. Axelrod, MD, Associate Professor of Clinical Medicine, Wayne State University School of Medicine; Chief, Hematology Division, Department of Medicine, Sinai Hospital; Consultant in Hematology, Providence and Mt. Carmel Hospitals

All-Day Postgraduate Course

Thursday, September 26, 1968
Course on "Difficult Decisions in Digestive Diseases"

West Room
Fifth Floor

8:45 - 5:00

Moderator: William S. Haubrich, MD, Division of Gastroenterology, Henry Ford Hospital

Guest Experts

J. Edward Berk, MD, Orange, California, Professor and Chairman, Department of Medicine, California College of Medicine

Melvin A. Block, MD, Chief, Division V, Department of General Surgery, Henry Ford Hospital

The surgical management of certain difficult problems involving diseases of the digestive tract will be discussed.

Alfred S. Frosbese, MD, Abington, Pennsylvania, Associate Professor of Surgery, School of Medicine, University of Pennsylvania; Chief of Staff and Director of Surgery, Abington Memorial Hospital

Special Contributors

"An Ileo-Colitis Problem"

Eugene A. Gelzayd, MD, Clinical Instructor, Department of Medicine, Wayne State University School of Medicine; Associate, Internal Medicine, Providence Hospital

Discussion of diagnosis and treatment of the inflammatory bowel diseases with special emphasis on ulcerative colitis and granulomatous colitis — ileocolitis syndromes.

A Liver Problem

Keith S. Henley, MD, Associate Professor of Internal Medicine, University of Michigan School of Medicine

A Puzzling Pancreaticoduodenal Problem

Ramon R. Joseph, Assistant Professor of Internal Medicine, University of Michigan School of Medicine; Director of Gastroenterology, Wayne County General Hospital

A Complicated Duodenal Ulcer Problem

William G. O'Driscoll, MD, Grand Rapids, Chairman, Department of Internal Medicine, St. Mary's Hospital; Consultant, Department of Internal Medicine, Providence Hospital

Multiple Manifestation of Hiatal Hernia

Joseph A. Rinaldo, Jr., MD, Director of Research, Mt. Carmel Hospital

The presentation will emphasize that adequate examination of the patient with esophageal symptoms now includes not only radiography and endoscopy but physicology as well. The patient to be presented will illustrate all of the nuances of this problem.

A Perplexing Gastric Lesion

Bernard M. Schuman, MD, Associate Physician, Division of Gastroenterology, Henry Ford Hospital

MSMS ANNUAL SESSION, SEPT. 25-26

House of Delegates, Sept. 22-23-24

Special "Ars Medica" Exhibition Being Brought to Detroit as Feature For MSMS 1968 Annual Session

BY ELLEN SHARP
CURATOR OF GRAPHIC ARTS
DETROIT INSTITUTE OF ARTS

Ars Medica is the title of an exhibition of prints depicting medical subjects which will be shown at The Detroit Institute of Arts from September 22 through October 20, 1968. This exhibition has been arranged in cooperation with the Institute's Department of Graphic Arts and a special committee of physicians especially for the 1968 Annual Session of the Michigan State Medical Society in Detroit, September 25-26.

The exhibition will consist of over 130 original works of art representing all types of graphic media—woodcuts, engravings, etchings, lighographs and serigraphs. The prints are grouped in 21 different categories.

SOME OF THE subjects covered are Hospitals in Peace and War, Hygiene and Preventive Medicine, Medical Teaching, The Madhouse, and Allegories of the Healing Arts.

One of the earliest prints in the exhibition is a woodcut from Ketham's *Fasciculus Medicinae* published in Venice in 1493. Entitled "The Zodiac Man" it is the oldest printed bloodletting chart.

A fine impression of the first etching by the great German graphic artist, Albrecht Durer, *Plate of Sketches,* depicts the four temperaments (or dominant humors) — the choleric, sanguine, melancholic and phlegmatic.

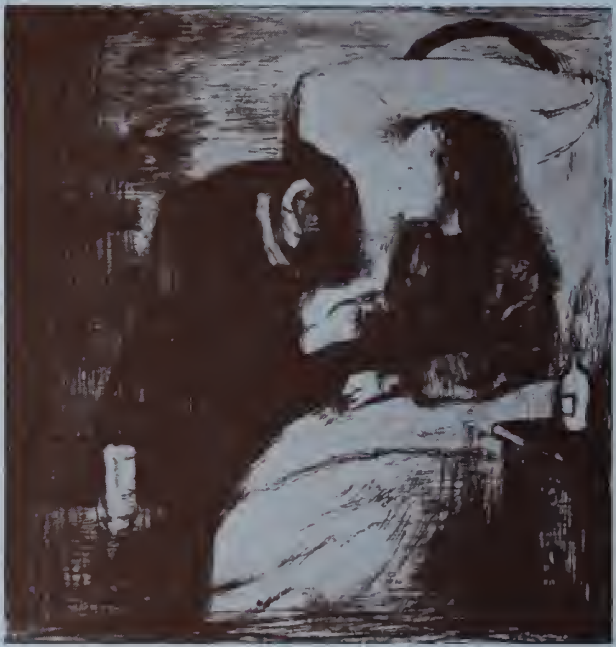
A Sixteenth-century etching by Abraham Bosse illustrates one of the commonest therapeutic measures of that era — phlebotomy. This print is characteristic of Bosse's work showing the life of the upper middle class in France with a wealth of detail.

A pioneer example of color printing, developed in the Eighteenth century, is Jacques Gautier Dagoty's mezzotint *Muscles of the Head,* plate I from *L'Anatomie de la Tete,* Paris, 1748.

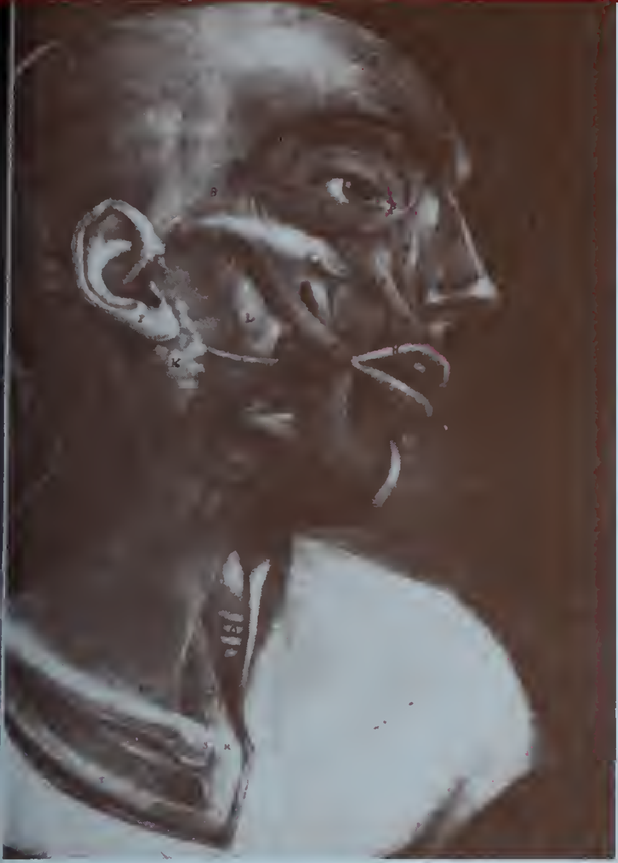
The great caricaturists and humorists of the eighteenth and nineteenth centuries did not neglect the medical profession. Thomas Rowlandson, George Cruikshank, James Gillray, Gavarni, and Honore' Daumier are represented in the exhibition.

Moving and powerful works by modern artists with medical themes are prints by Edvard Munch, Kathe Kollwitz and Michael Mazur.

SOME OF THE MOST interesting prints in the exhibition are portraits of great physicians of the past, such as Paracelsus, Ambroise Pare', Andreas Vesalius, William Harvey, and Carolus Linnaeus.

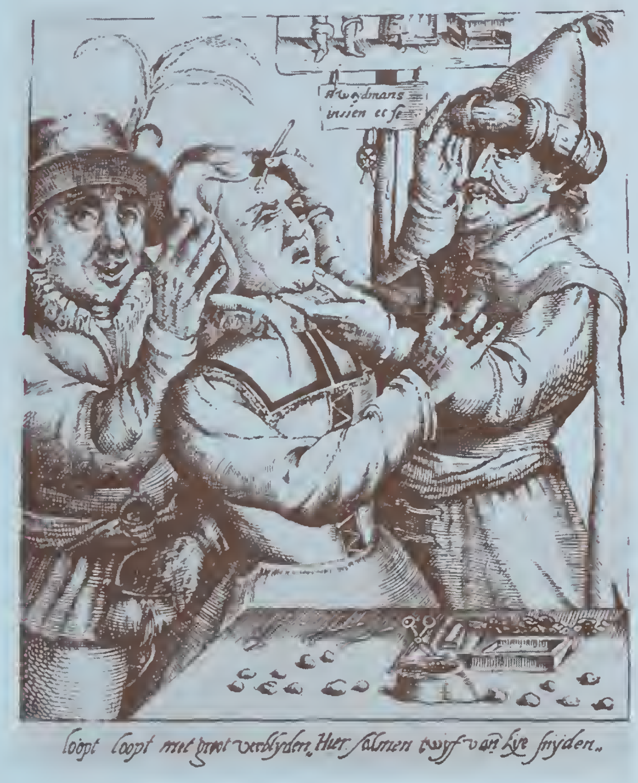


The Sick Child 1894, a drypoint, was made by Edward Munch (Norwegian, 1863-1944). Drypoint is a process often combined with engraving and etching. A metal tool with a tapered point is used to scratch the design on the plate. The burr raised on the plate on each side of the line created by the drypoint tool produces a soft, blurred line quite different from the sharp, swelling line of the engraver's burin, or the flowing, thread-like etched line.

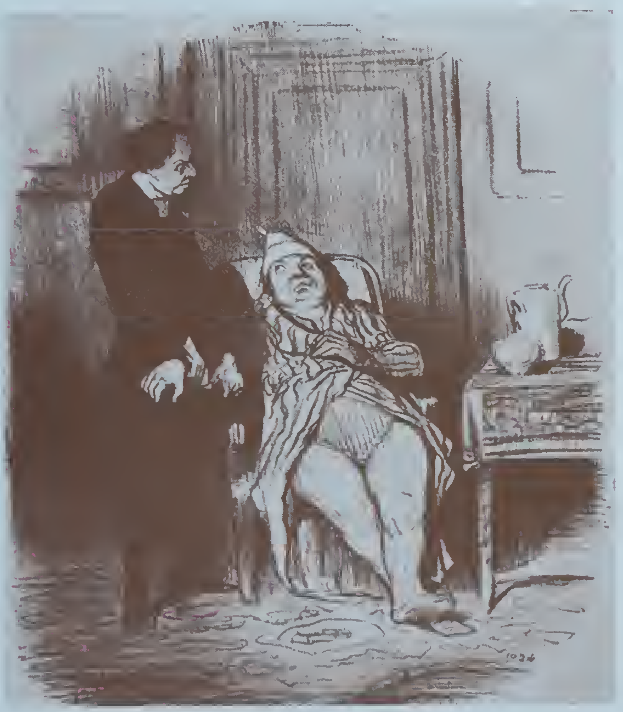


The Muscles of the Head, plate I of **L'Anaotomie de la Tete,** Paris, 1748, is a mezzotint printed in color by Jacques Gautier D'Agoty. A mezzotint is a print produced by a variant of the engraving process, developed to produce tone. A metal plate is roughened uniformly with a tool called a rocker which has a curved, serrated head; gradations of tone are obtained by scraping and burnishing away the roughened surface. The process, invented in the seventeenth century, was used extensively in the eighteenth century.

Operation for Stones in the Head, an engraving, was done by H. Weydmans (Dutch, early 17th Century). An engraving is a print taken from a metal plate on which the design has been incised with a sharp instrument, the burin or graver. The incised plate is inked, wiped and printed. The successful printing of a metal plate requires the pressure of a double-roller press to force the paper into the incised, inked lines.



H.weydmans
inven et fe
loopt loopt met groot verblyden, Hier ſalmen twyf van kye ſnyden.



"Oh Doctor, I'm sure I'm consumptive" says the patient in this lithograph by Honore' Daumier (French 1808-1879). This appeared in a series **All One Could Wish For (Tout ce qui' on voudra),** Paris, 1847. Lithographs are made from a stone block (or zinc plate) on which the areas of the design have been drawn with a greasy substance applied by pen, brush or crayon. The design then is fixed in the stone by treating it with acid and gum arabic. For printing the surface of the stone is dampened and then rolled with greasy ink. The greasy ink adheres to the grease of the image and is repelled by the dampness from the rest of the surface. The inked stone is then printed in a press in which sliding pressure is applied rather than rolling pressure as in an etching press. For color printing, a separate stone is used for each color.

Offer AAGP Credit For Attendance

Members of the Michigan Academy of General Practice will receive credit for each hour they attend the 1968 Annual Session. Application for approval should be made to James Dooley, MD, Chairman, Commission on Education, 3210 S. Dort Highway, Flint.

Read Inside Pages for Topics, Speakers For Annual Session, September 25-26

It's that time of year again!

Yes, that very important time, the season for the MSMS Annual Scientific Session, September 25-26 in Detroit.

In this 103rd year of the Society, MSMS officials and staff are working to surpass previous scientific sessions by presenting an even greater array of programs and exhibits. In addition to the fine opportunity for postgraduate education, physicians will have a chance to renew old friendships and make new ones through alumni groups and other social activities.

Every MSMS member is urged by MSMS President Bradley M. Harris, M.D., to decide now to participate in the excellent postgraduate experience. Doctor Harris praises the work of the Annual Scientific Session Program Committee and Alexander J. Walt, M.D., Detroit, the chairman.

Following tradition, the Scientific Session will follow the three-day meetings of the MSMS House of Delegates, September 22-23-24.

Study this copy of the excellent 1968 Annual Scientific Session.

See you there. . .

Among the Highlights On Detroit Program

The highlights of the 1968 Annual Session include:

Four Breakfast Roundtables
Four All-Day Courses
Two General Luncheons with Speakers
 on "Drugs, Doctors, Government" and
 "Organ Transplantation"
General Assembly Programs
Many MSMS Section Programs
Medical Specialty Society Events
MDPAC Breakfast
Office Management Seminar
Presidents Party
"Ars Medica Art Exhibit"
Educational Exhibits
And Many Other Highlights

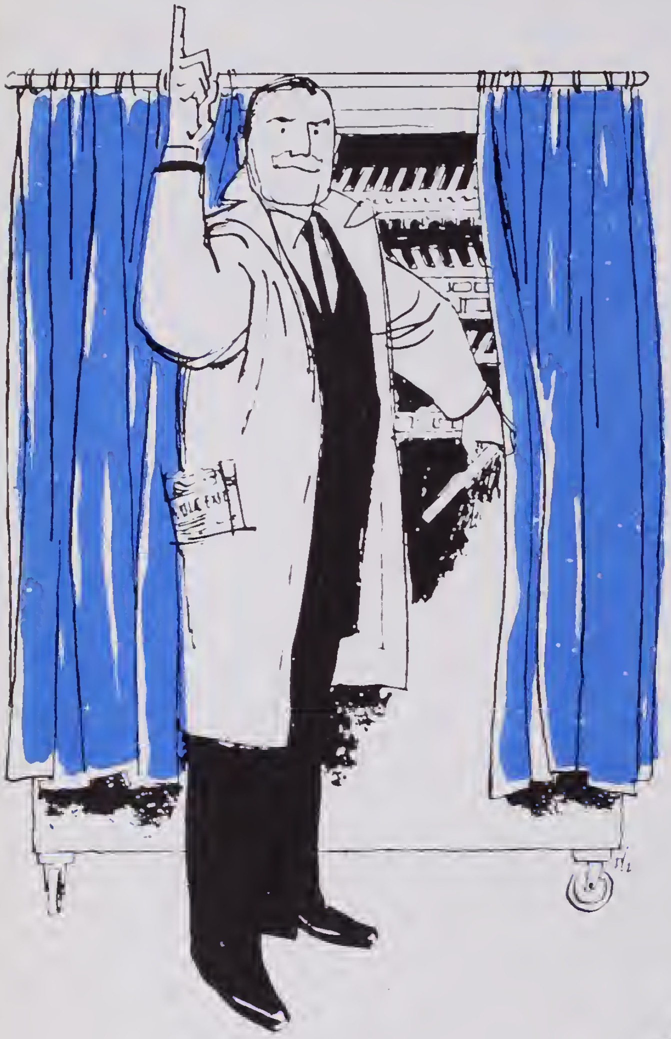
Honored As
"Outstanding Physician of the Year"

MICHIGAN STATE MEDICAL
SOCIETY JOURNAL
VOLUME 67, NUMBER 19
OCTOBER, 1968

AMONG THE EXCELLENT ARTICLES INSIDE:
- —GENETIC FACTORS IN PHYSICAL GROWTH AND DEVELOPMENT
- —SEVERE ASTHMA IN CHILDREN
- —SOLUTIONS SOUGHT IN AIR POLLUTION
- —ADVICE ON YEAR END TAX PLANNING
- —HEALTH PLATFORMS OF POLITICAL PARTIES

. . . but Doctor, will he represent your interests?

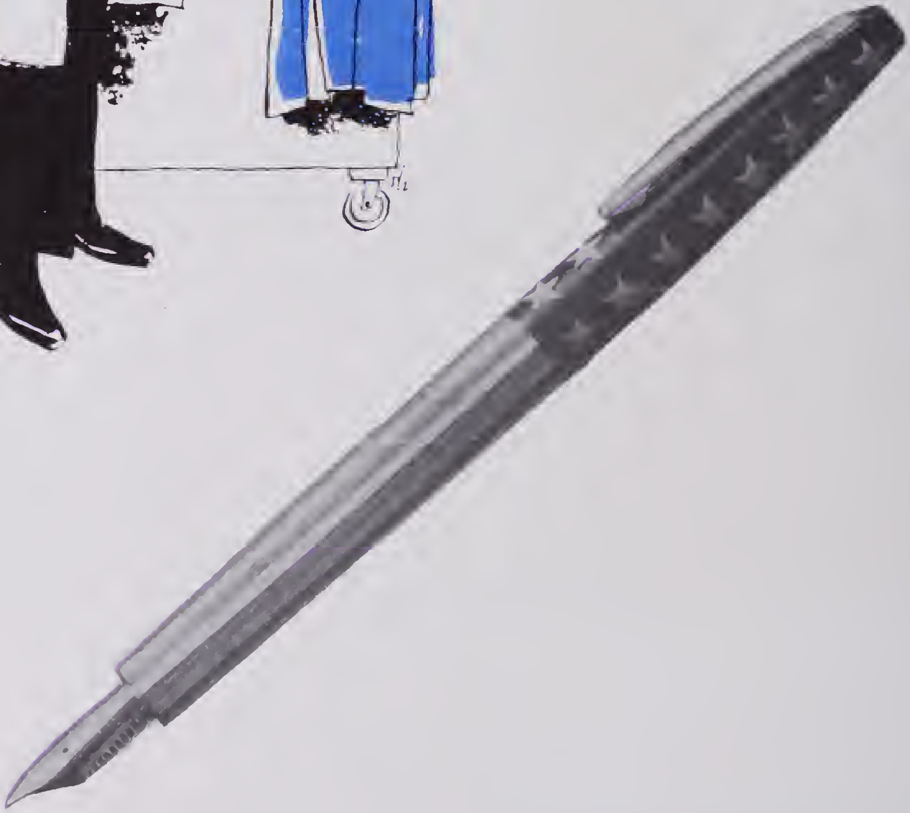


Approximately 2,000 bills of interest to medicine were introduced in the U.S. Congress this year, as were over 150 health bills in the Michigan Legislature.

The responsibility for endorsing, financing and helping to elect wise, dependable political candidates who will listen to the views of the medical profession before voting, rests primarily upon MDPAC and AMPAC.

The MDPAC board is currently assessing the voting record of all legislators and will financially support on a bipartisan basis over sixty candidates for the 1969 legislature. Several members of the Michigan delegation to the Congress have likewise been recipients of MDPAC funds. Much more help is needed. MDPAC has doubled its membership in 1968, and is now approaching 30% of MSMS membership.

MDPAC's effectiveness could develop into a brilliant political success story. It needs your help to accomplish this, and in the 1968 election year a membership of at least a third of Michigan doctors is essential. For twenty-five dollars you can become a member of both AMPAC and MDPAC. MDPAC can only succeed in doing an effective job of campaigning in ratio to the amount of financial help it receives from doctors of medicine.



May we urge you to assume your political responsibility as a contributing member of MDPAC-AMPAC. Help us to elect and retain the best men we can get in office both in Lansing and Washington!

The MSMS House of Delegates and The Council endorse, encourage, and strongly recommend that every Michigan doctor of medicine become a member of MDPAC and AMPAC. CONTRIBUTIONS ARE NOT DEDUCTIBLE ON FEDERAL INCOME TAX RETURNS.

Please mail your check for $25.00 today to:

LACTINEX®

TABLETS & GRANULES

- **to help restore and stabilize the intestinal flora**
- **for fever blisters and canker sores of herpetic origin**

LACTINEX contains both *Lactobacillus acidophilus* and *L. bulgaricus* in a standardized viable culture, with the naturally occurring metabolic products produced by these organisms.

First introduced to help restore the flora of the intestinal tract in infants and adults,[1, 2, 3, 4] LACTINEX has also been shown to be useful in the treatment of fever blisters and canker sores of herpetic origin.[5, 6, 7, 8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

It isn't always necessary to adjust urinary pH in treating G.U. infections.

Not when the causative organism is a strain sensitive to DECLOMYCIN® Demethylchlortetracycline, as is often the case.

DECLOMYCIN remains stable and active in either acid or alkaline urine. So there's no need to acidify the urine to keep the antibiotic at work.

Why match the urine to the antibiotic...when you can match the antibiotic to the urine...by prescribing DECLOMYCIN. A b.i.d. dosage makes therapy convenient for your patient.

Effectiveness: DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines in infections caused by organisms sensitive to the tetracyclines.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system – anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin – maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney – rise in BUN, apparently dose-related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions–urticaria, angioneurotic edema, anaphylaxis. Teeth – dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Capsules: 150 mg; Tablets: film coated – 300 mg, 150 mg and 75 mg of demethylchlortetracycline HCl.

MSMS PRESIDENT'S MESSAGE

Observations about Complications

The changing of the guard has again been accomplished and as your President for the next twelve months it will be my privilege, honor and pleasant duty to present a monthly page or two of delectable composition concerning computerized health and other matters of mutual concern in these United States and particularly in our own state of Michigan.

The understatement of the year is that—"the practice of medicine is changing rapidly and is becoming much more complicated"—as anyone who is in anyway associated with the direct care of patients in or out of hospitals, knows—but actually these incessant changes in medical practice, started many years ago with the introduction of health insurance in all of it's forms. Don't blame Medicare and Medicaid for all of the difficulties one encounters in medical practice today. All that these programs have done is to add a few more frustrating daily experiences to your already heavy load of past frustrations.

UNFORTUNATELY, ALONG with this great influx of new complicated printed forms and new rules and regulations of hospital medical practice, there has already appeared on the horizon the philosophy of depersonalization of the patient-physician relationship—mainly because physicians cannot possibly spend the time as they used to—listening patiently to the complaints of people and trying to figure out whether the complaints are based on physical defects or psychosomatic symptoms of a functional or emotional nature.

There is no substitute for the face to face confrontation of the patient with a physician and the computerized analysis of symptoms followed by a quick view of the patient on direct hospital or office television cannot possibly give the patient anything but a feeling of insecurity.

THE PROBLEM, OF COURSE, revolves around two facts—the increasing number of people demanding medical care and the decreasing number of physicians to service those patients who have specific physical complaints or who are looking to someone for a "checkup." About 70% of patients seen in routine office practice, do not have a physical basis for their symptoms—but if the philosophy of preventive medicine is to be continued, it will be necessary for someone to examine these people to detect latent disease or possible early malignancy.

We are without question entering a new era in which the long established and very personal relationship between patient and Doctor is in jeopardy. Modern medicine is broadly based with a variety of specialists, both professional and non-professional trying to co-operate in the care of a single patient. In most instances an outside agency pays the bill. How, in this complex relationship we are to preserve some semblence of stability, should be a matter of deep concern to all of us.

ANOTHER DISQUIETING thought that will cause a further shortage of physicians, is the fact that Doctors are now retiring at an earlier age because of overwork or because of physical ailments, brought on by overwork. Various types of so-called "Group Practice" are developing to alleviate some of the problems previously associated with solo practice, so that group responsibility may lessen the physican strain and drain on individual practitioners.

Health legislation has created a great demand for physician's services, but legislation is unable to cope with the problem of professional manpower shortage. Good health cannot be legislated; we can work with government — but not for it.

Finally...a salicylate superior to aspirin?

Not at all, Doctor...but

magan®

(magnesium salicylate, W-T)

should be considered for your arthritic
and rheumatic patients who cannot tolerate aspirin.

Surveys* made in 1966 and 1967 among private practice physicians showed an incidence of intolerance to aspirin ranging from 3-85%. The majority of physicians surveyed reported an intolerance in 10-30% of their patients.

How does this compare with your experience?

WARREN-TEED PHARMACEUTICALS INCORPORATED
COLUMBUS, OHIO 43215
SUBSIDIARY OF **ROHM AND HAAS COMPANY**

10-30

*by two independent national research organizations

Don't use Magan on all your patients–

consider Magan for those patients who cannot take aspirin because of gastric discomfort

Private Practice Physicians tried Magan on almost 700 patients whom they judged intolerant to aspirin and other salicylates.

The majority of these patients could take Magan and obtain the benefit of salicylate therapy.

magan **an alternate salicylate**

(magnesium salicylate, W-T)

May be tolerated by some persons intolerant to aspirin by reason of gastrointestinal irritation.

Magan is a new salicylate product from Warren-Teed.

A single chemical entity . . . no coating, no buffering, sodium free and non-acetylated.

Composition: Each orange colored tablet contains 5 grains (approx. 325 mg) of magnesium salicylate.

Dosage: 1 or 2 tablets every 4 hours with a full glass of water.

Togetherness....

...can be rough when epidemics of nausea and vomiting strike a family. Emetrol offers prompt, safe relief. It is free from toxicity[1] or side effects[2,3] and will not mask symptoms of serious organic disorders.

OMNI-TUSS® b.i.d.

. . . because OMNI-TUSS is indicated for cough associated with upper respiratory tract infections, bronchitis, bronchiectasis, bronchial asthma, emphysema, sinusitis and rhinitis, hay fever, or other allergic conditions. Any of these conditions may exhibit the general symptom syndrome—coughing, wheezing, bronchospasm, and tenacious mucus—which may benefit from the antitussive, bronchodilative, antihistaminic, and expectorant action of Omni-Tuss.

The therapeutic usefulness of Omni-Tuss is enhanced by a unique resin complex formulation providing the clinically desirable advantages of: (1) uniform drug availability throughout an extended period, (2) 8 to 12 hours of symptomatic control, (3) minimal dosage requirement, (4) minimal side effects.

Economical, efficient **b.i.d.** dosage—extremely well-tolerated by children, 6-12, and adults.

'Omni Tuss' Suspension: Each teaspoonful (5 cc.) contains 10 mg. codeine (Warning: May be habit-forming), 5 mg. phenyltoloxamine, 3 mg. chlorpheniramine, 25 mg. ephedrine, all as cation exchange resin complexes of sulfonated polystyrene, and 20 mg. guaiacol carbonate.

Available on prescription only. Class X exempt narcotic. Permissible on oral prescription.

Dosage: *Adults:* 1 teaspoonful (5 cc.) q12h.
Children (6-12 *years*): ½ teaspoonful q12h.

Side Effects: Minimal, but when encountered may include jitteriness, nausea, drying of mouth, insomnia, constipation, which disappear upon adjustment of the dose or discontinuance of treatment.

Precautions and Contraindications: For complete detailed information, refer to package insert or official brochure.

Strasenburgh
Strasenburgh Laboratories Division
Wallace & Tiernan Inc., Rochester, N.Y.

In the complex picture of moderate to severe anxiety...

there is a new reason for prescribing Mellaril
(Thioridazine HCl)

effectiveness in mixed anxiety-depression

Long recognized for its usefulness in the treatment of moderate to severe anxiety, Mellaril is now also known to be effective against mixed anxiety-depression.

Often the symptoms of anxiety states are difficult to sort out—even with the most careful probing. The patient may manifest symptoms of agitation, restlessness, insomnia, somatic complaints. But what of the depression that may be mixed in the total picture? It is reassuring to know that Mellaril may be prescribed—with strong possibilities of success—when there is anxiety alone or a mixture of anxiety and depression.

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.
Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.
Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.
Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.
Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine hydrochloride). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

Mellaril®
(Thioridazine HCl)
25 mg. t.i.d.

for moderate to severe anxiety and mixed anxiety-depression

SANDOZ SANDOZ PHARMACEUTICALS, HANOVER, N. J. 68-1

Parke, Davis & Company, Detroit, Michigan 48232

PARKE-DAVIS

No two women are quite alike...

Ovulen-21 Com
Directions

and no other oral contraceptive is quite like Ovulen-*21*®

Each tablet contains ethynodiol diacetate 1 mg., mestranol 0.1 mg.

The progestin is distinctive, and for some women this may mean a different clinical response. The Compack® tablet dispenser is distinctive; its functional simplicity makes it virtually patient-proof. The acceptance of Ovulen-21 is distinctive... together with Ovulen®, it is more often prescribed than any other individual contraceptive product currently available.

Indication—Oral contraception.

Contraindications—Thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia, undiagnosed abnormal genital bleeding.

Warnings—Watch for the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism, retinal thrombosis); if present or suspected discontinue the drug immediately.

British studies reported in April 1968[1,2] estimate there is a seven- to tenfold increase in mortality and morbidity due to thromboembolic diseases in women taking oral contraceptives. In these controlled retrospective studies, involving 36 reported deaths and 58 hospitalizations due to "idiopathic" thromboembolism, statistical evaluation indicated that the differences observed between users and non-users were highly significant. The conclusions reached in the studies are summarized in the table below:

Comparison of Mortality and Hospitalization Rates Due to Thromboembolic Disease in Users and Non-Users of Oral Contraceptives in Britain.

Category	Mortality Rates		Hospitalization Rates (Morbidity)
	Age 20-34	Age 35-44	Age 20-44
Users of Oral Contraceptives	1.5/100,000	3.9/100,000	47/100,000
Non-Users	0.2/100,000	0.5/100,000	5/100,000

No comparable studies are yet available in the United States. The British data, especially as they indicate the magnitude of the increased risk to the individual patient, cannot be applied directly to women in other countries in which the incidences of spontaneously occurring thromboembolic disease may differ.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or sudden onset of proptosis, diplopia or migraine. Withdraw medication if papilledema or retinal vascular lesions are found.

Since the safety of Ovulen in pregnancy has not been demonstrated, it is recommended that pregnancy be ruled out for any patient who has missed two consecutive periods before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the first missed period.

A small fraction of the hormone agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions—Pretreatment physical examination should include special reference to the breasts and pelvic organs, and a Papanicolaou smear.

Endocrine and possibly liver function tests may be affected by Ovulen. Therefore, it is recommended that such tests if abnormal be repeated after the drug has been withdrawn for two months.

Pre-existing uterine fibromyomas may increase in size under the influence of progestogen-estrogen preparations.

Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation.

In breakthrough bleeding, and all irregular vaginal bleeding, consider nonfunctional causes. Adequate diagnostic measures are indicated in undiagnosed vaginal bleeding.

Carefully observe patients with a history of psychic depression and discontinue the drug if severe depression recurs.

Any possible influence of prolonged Ovulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study.

A decrease in glucose tolerance has occurred in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be observed carefully while receiving Ovulen.

Because of the effects of estrogens on epiphyseal closure Ovulen should be used judiciously in young patients in whom bone growth is not complete.

The age of the patient constitutes no absolute limiting factor, although Ovulen therapy may mask the onset of the climacteric.

The pathologist should be informed of Ovulen therapy when relevant specimens are submitted.

Adverse Reactions—A statistically significant association has been shown between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: cerebrovascular accidents, neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement, secretion), change in weight, changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, allergic rash, rise in blood pressure in susceptible individuals, mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme and nodosum, hemorrhagic eruption, itching.

The following laboratory results may be altered by oral contraceptives: hepatic function: increased sulfobromophthalein and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 values; metyrapone test; pregnanediol determination.

"Breathing's a snap again," he said gingerly.

(COMPLIMENTS OF DIMETAPP)

Help clear up that miserable stuffed-up feeling with Dimetapp. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. The key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done . . . in a hurry.

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis. *Contraindications:* Hypersensitivity to antihistamines. Not recommended for use during pregnancy. *Precautions:* Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. *Side Effects:* Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered. *Dosage:* 1 Extentab morning and evening. *Supplied:* Bottles of 100 and 500.

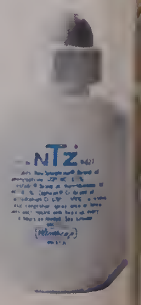
"The inconvenience of a cold"

For a cold: NTz® Nasal Spray provides rapid relief of nasal symptoms. Relief starts with the first spray which opens the inferior part of the common meatus. A second spray, a few minutes later, will shrink the turbinates to help provide sinus drainage and ventilation. Dosage may be repeated every three or four hours as needed, for temporary relief of symptoms. NTz is well tolerated but overdosage should be avoided.

As a sinusitis deterrent, NTz Nasal Spray can be used to keep the nasal passages open during a cold to help prevent development of acute sinusitis—or to help prevent the acute condition from becoming chronic.

Supplied: NTz Nasal Spray, plastic squeeze bottles of 20 ml.; NTz Nasal Solution, bottles of 30 ml. (1 fl oz.) with dropper.

NTz is more than a simple vasoconstrictor. It contains
- Neo-Synephrine® (brand of phenylephrine) HCl 0.5 per cent, the major component, virtually synonymous with fast, efficient but gentle nasal vasoconstriction.
- Thenfadil® (brand of thenyldiamine) HCl 0.1 per cent, topical antihistamine for reduction of rhinorrhea, sneezing or itching. It combats the allergic reactions that may occur in colds or sinusitis.
- Zephiran® (brand of benzalkonium, as chloride, refined) 1:5000, antiseptic preservative and wetting agent to promote penetration and spread of the formula.



Winthrop Laboratories, New York, N.Y. 10016 Winthrop

Dilantin®
(diphenylhydantoin)

PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

when the diagnosis is depression

ELAVIL® HCl

(AMITRIPTYLINE HCl | MSD)

Indications: Mental depression and mild anxiety accompanying depression.

Contraindications: Glaucoma and predisposition to urinary retention. Not recommended in pregnancy.

Precautions and Side Effects: Drowsiness may occur within the first few days of therapy. Patients should be warned against driving a car or operating machinery or appliances requiring alert attention. When depression is accompanied by anxiety or agitation too severe to be controlled by ELAVIL HCl alone, a phenothiazine tranquilizer may be given concomitantly. Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having varying modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Monoamine oxidase inhibitor drugs may potentiate other drugs and such potentiation may even cause death; permit at least two weeks to elapse between administration of two agents; in such patients, initiate therapy with ELAVIL HCl cautiously with gradual increase in dosage required to obtain a satisfactory response. Caution patients about errors of judgment due to change in mood, and that the response to alcohol may be potentiated. May provoke mania or hypomania in manic-depressive patients.

Side effects include drowsiness; dizziness; nausea; excitement; hypotension; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of schizophrenia which may require phenothiazine tranquilizer therapy; epileptiform seizures in chronic schizophrenics; temporary confusion, disturbed concentration or, rarely, transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of the mouth, blurring of vision, urinary retention, constipation; paralytic ileus; jaundice; agranulocytosis.

Careful observation of all patients is recommended. The antidepressant activity may be evident within 3 or 4 days or may take as long as 30 days to develop adequately, and lack of response sometimes occurs. Response to medication will vary according to severity as well as type of depression present. Elderly patients and adolescents can often be managed on lower dosage levels.

Supplied: Tablets ELAVIL HCl, containing 10 mg., 25 mg., and 50 mg. amitriptyline HCl, bottles of 100 and 1000; Injection ELAVIL HCl, in 10-cc. vials, containing per cc.: 10 mg. amitriptyline HCl, 44 mg. dextrose, 1.5 mg. methylparaben, and 0.2 mg. propylparaben.

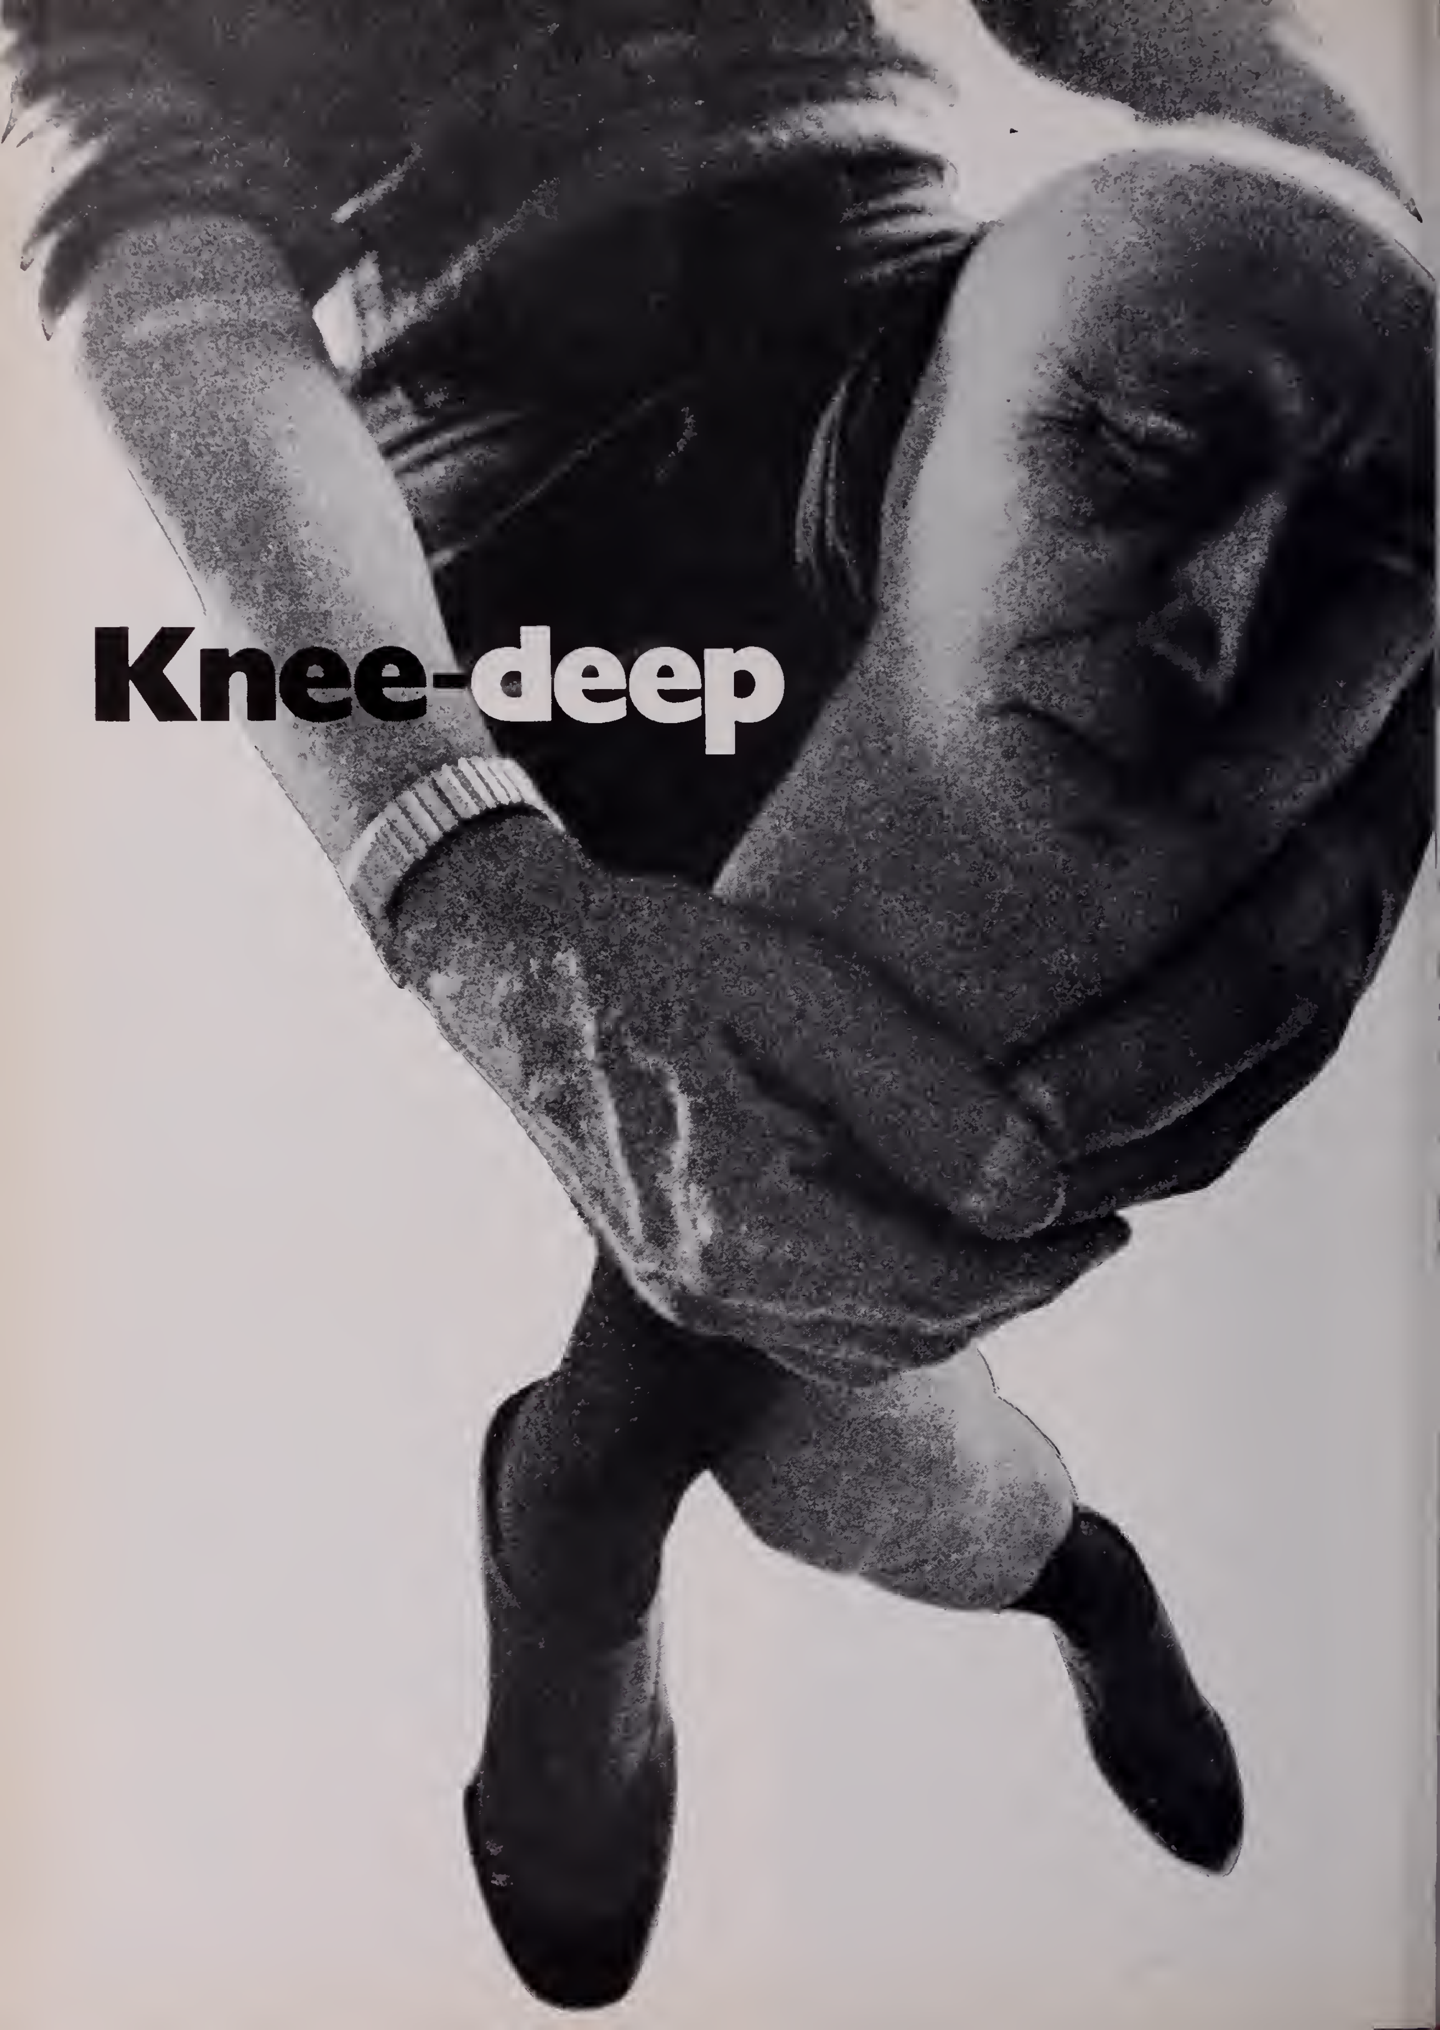
WHERE TODAY'S THEORY IS TOMORROW'S THERAPY



Knee-deep

in osteoarthritic pain

If aspirin doesn't help, move in ith Tandearil.

The trial period is brief: 1 week. ry one tablet q.i.d. at first. Tandearil sually starts working within 3 to 4 days. hen response occurs, as little as 1 or tablets daily may hold back pain and tiffness, and increase joint motion.

On the next page is a summary f adverse reactions, contraindications, arning and precautions.

Tandearil.
It can help get his mind off his knee.

Please review full Prescribing Information carefully before prescribing.

For osteoarthritic knees, spines, shoulders, hips, etc.:

Tandearil®
oxyphenbutazone

ndearil, oxyphenbutazone:
r brief summary see next page.

Geigy

TA-6006

Tandearil®

oxyphenbutazone

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: This drug is an analog of phenylbutazone; sensitive patients may be cross-reactive. If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy, and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patients should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia), sudden weight gain (water retention), skin reactions, black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension, the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), or a generalized allergic reaction similar to a serum sickness syndrome may occur and require permanent withdrawal of medication. Agranulocytosis can occur suddenly in spite of regular, repeated normal white counts. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angiitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis: Initial: 3 to 6 tablets daily in divided doses. Usually unnecessary to exceed 4 tablets daily. A trial period of one week is considered adequate to determine the therapeutic effect of the drug. Maintenance: Effective level often achieved with 1 or 2 tablets daily, should not exceed 4 tablets daily.

In selecting appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response.

Availability: Tan, round, sugar-coated tablets of 100 mg. in bottles of 100 and 1000.

in the treatment of
IMPOTENCE
Android®
(thyroid-androgen) TABLETS

*Effectiveness confirmed by another double blind study**

1.SUMMARY

ANDROID	GOOD TO EXCELLENT 75%
PLACEBO	20%

2. Forty cases reported.
3. Cites synergism between androgen and thyroid.
4. No side effects in patients treated.
5. Alleviation of fatigue noted
6. Case histories on 4 patients.
7. Although psychotherapy still needed, role of chemotherapy cannot be disputed.

"Sexual impotence treatment with methyl testosterone – thyroid (ANDROID) a double blind study" – Montesano, Evangelista: Clinical Medicine, April 1966.

CONTRAINDICATIONS—Methyl testosterone is not to be used in malignancy of reproductive organs in male, coronary heart disease. Thyroid is not to be used in heart disease, hypertension unless the metabolic rate is low.

Choice of **4** *strengths*

Android

Each yellow tablet contains:
Methyl Testosterone . . 2.5 mg.
Thyroid Ext. (1/6 gr.) . . 10 mg.
Glutamic Acid . . . . 50 mg.
Thiamine HCL . . . . 10 mg.
Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-HP
HIGH POTENCY

Each red tablet contains:
Methyl Testosterone . . 5.0 mg.
Thyroid Ext. (½ gr.) . . . 30 mg.
Glutamic Acid . . . . 50 mg.
Thiamine HCL . . . . 10 mg.
Dose: 1 tablet 3 times daily.
Available:
Bottles of 100, 500, 1000.

Android-X
EXTRA HIGH POTENCY

Each orange tablet contains:
Methyl Testosterone . 12.5 mg.
Thyroid Ext. (1 gr.) . . . 64 mg.
Glutamic Acid . . . . 50 mg.
Thiamine HCL . . . . 10 mg.
Dose: 1 or 2 tablets daily.
Available:
Bottles of 60, 500.

Android-Plus
WITH HIGH POTENCY
B-COMPLEX AND VITAMIN C

Each white tablet contains:
Methyl Testosterone . . 2.5 mg.
Thyroid Ext. (¼ gr.) . . . 15 mg.
Ascorbic Acid (Vit. C) . 250 mg.
Thiamine HCL . . . . 25 mg.
Glutamic Acid . . . . 100 mg.
Pyridoxine HCL . . . . 5 mg.
Niacinamide . . . . 75 mg.
Calcium Pantothenate . 10 mg.
Vitamin B-12 . . . . 2.5 mcg.
Riboflavin . . . . 5 mg.
Dose: 2 tablet twice daily.
Available: Bottles of 60, 500.

Write for literature and samples:
BROWN
THE BROWN PHARMACEUTICAL CO.

REFER TO
PDR

also available with ESTROGEN

Android-E

Each Tablet Contains:
Methyl Testosterone . . . . . 2.5 mg.
Ethinyl Estradiol . . . . 0.02 mg.
Thyroid Ext. (1/6 gr.) . . . . . 10 mg.
Thiamine Hydrochloride . . . . 10 mg.
Glutamic Acid . . . . 50 mg.

INDICATIONS: Advantage is taken of the anabolic action of ANDROID without its virilizing effect. Estrogen balances the androgen—only steroid effect remains. Geriatrics, post-operative and debilitating disease, osteoporosis. **DOSE**: One tablet t.i.d. Female patients should have a rest period 5 to 7 days after 21 days of medication. **SIDE EFFECTS**: In the female, excessive dosage may produce virilizing effects of most androgens: hoarseness, hirsutism, enlarged clitoris. Symptoms can be avoided by keeping the dosage below 300 mg of testosterone per month. **CONTRA-INDICATIONS**: See Android. Ethinyl estradiol is not to be used in latent malignancy of reproductive organs or mammary glands.

"All Registered Nurses are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards. Therefore, all registered nurses are alike.

That's nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all registered nurses aren't alike, either.

© American Map Co New York No NY 388

See inside fold for product summary.

Effectiveness: ACHROMYCIN Tetracycline is a crystalline broad-spectrum antibiotic which provides effective therapeutic activity against susceptible microorganisms.

Contraindication: History of hypersensitivity to tetracycline.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. Some patients may develop a photodynamic reaction to natural or artificial sunlight. Those with a history of photosensitivity reactions should avoid direct exposure to sunlight while under treatment. Discontinue drug at first evidence of skin discomfort.

Precautions: Use may result in overgrowth of nonsusceptible organisms. Constant observation is essential. If new infections appear, take appropriate measures. Use of tetracycline during teeth development may cause discoloration of teeth.

Side Effects: Gastrointestinal system—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin—maculopapular and erythematous rashes (a case of exfoliative dermatitis has been reported); photosensitivity reaction, onycholysis and discoloration of nails (rare). Kidney—rise in BUN, apparently dose-related. Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. In young infants, bulging fontanels have been reported following full therapeutic dosage. This symptom has disappeared rapidly when drug is discontinued. Teeth—dental staining (yellow-brown) in children of mothers given tetracycline during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. Blood—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. Liver—cholestasis (rare), usually at high dosage. Tetracycline may form a stable calcium complex in bone-forming tissue. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy.

Average Adult Daily Dosage: One Gm. per day, in 4 divided doses of 250 mg. each. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

ACHROMYCIN® WORKS HERE
TETRACYCLINE

Actually ACHROMYCIN works wherever the infection is due to an organism your lab cultures have shown to be tetracycline-sensitive. No other tetracycline—or analogue—can assure you of quicker or more effective antibiotic action. After all, isn't that what you want for your patient?

ACHROMYCIN was a pioneer in tetracycline therapy. Seventeen years of experience have shown that when the respiratory system, the genitourinary system, or the skin and soft tissue require treatment for infection probably caused by any of a number of sensitive strains, ACHROMYCIN is a wise choice for therapy while awaiting test results.

Available in 31 useful forms to meet your situational needs.

It's almost as if you were there to give an injection of penicillin

dependable oral penicillin therapy V-Cillin K®, Pediatric

Potassium Phenoxymethyl Penicillin

Description: V-Cillin K, the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly), combines acid stability with immediate solubility and rapid absorption. Higher, more rapid serum levels are obtained than with equal oral doses of penicillin G.

Indications: Streptococcus, pneumococcus, and gonococcus infections; infections caused by sensitive strains of staphylococci; prophylaxis of streptococcus infections in patients with a history of rheumatic fever; and prevention of bacterial endocarditis after tonsillectomy and tooth extraction in patients with a history of rheumatic fever or congenital heart disease.

Contraindication: Penicillin hypersensitivity.

Warnings: In rare instances, penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin or with bronchial asthma or other allergies. Resuscitative drugs should be readily available. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: Use cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with high parenteral dosage schedules, frequent evaluation of the renal and hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory studies (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowth of penicillin-insensitive organisms. In such cases, discontinue administration and take appropriate measures.

Adverse Reactions: Although serious allergic reactions are much less common with oral penicillin than with intramuscular forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it possesses a significant index of sensitization. The following hypersensitivity reactions have been reported: skin rashes ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; and reactions resembling serum sickness, including chills, fever, edema, arthralgia, and prostration. Severe and often fatal anaphylaxis has occurred (see Warnings). Hemolytic anemia, leukopenia, thrombocytopenia, and nephropathy are rarely observed side-effects and are usually associated with high parenteral dosage.

Administration and Dosage: Usual dosage range, 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, 50 mg. per Kg. per day divided into three doses.

See package literature for detailed dosage instructions for prophylaxis of streptococcus infections, surgery, gonorrhea, and severe infections.

How Supplied: Tablets V-Cillin K® (Potassium Phenoxymethyl Penicillin Tablets, U.S.P.), 125 mg. (200,000 units), 250 mg. (400,000 units), and 500 mg. (800,000 units).

V-Cillin K® (potassium phenoxymethyl penicillin, Lilly), Pediatric, for Oral Solution, 125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc. of solution (approximately one teaspoonful). [042567A]

Genetic Factors In Physical Growth and Development

BY JOHN C. GALL, JR., M.D.
DETROIT

INTRODUCTION

The observation that "like begets like" was probably one of the earliest scientific observations made by man. As applied to human growth and development, the influence of heredity is most striking in those conditions characterized by pathological growth, whether excessive (giantism) or inadequate (dwarfism).

PATHOLOGICAL GROWTH

DISORDERS DUE TO SINGLE GENES

Dwarfism. Obviously, many diseases can cause stunted growth, and a number of these are determined by single genes. The basic defect may be a disturbance of bone, a hormonal disorder, or an abnormality of cellular metabolism. An example, known from ancient times, is achondroplastic dwarfism. In this condition, which is due to an autosomal dominant gene, a disturbance of bone growth results in abnormally short bones of the extremities producing a very short individual with characteristic bodily proportions. Ancient Egyptian sculptures clearly portray the short arms and legs, the normal-size trunk and the relatively large head which is commonly somewhat hydrocephalic.[1] Although the condition does not result in sterility, relatively few achondroplastics produce offspring. Thus most cases are due to new mutations. There is usually no impairment of intelligence. A brilliant contemporary actor, who played the dwarf in the movie "Ship of Fools," is an achondroplastic.

The recognition of genetically determined syndromes associated with shortness of stature is important clinically, both in terms of adequate treatment and for purposes of genetic counseling. A very practical approach to the clinical evaluation of the short child has recently appeared in this Journal.[2] A useful (though not exhaustive) Compendium on Shortness of Stature, listing over 50 syndromes, many of them genetically determined, has recently been published.[3] Tables 1 - 3 list some of the genetically-determined conditions associated with impaired growth.

Giantism. Among the famous giants of history were the champion of the Philistines, Goliath, and the Roman Emperor Maximinus (172-238 A.D.), whose main claim to imperial power appears to have been his enormous stature, estimated by contemporaries at about eight feet. We are not certain of the diagnosis in either case. Perhaps the most common single-gene cause of giantism is Marfan's syndrome, sometimes called arachnodactyly because of the long spidery arms and legs present in most cases. The complete picture includes eye defects, in particular dislocated lenses, and cardiovascular abnormalities, most notably a tendency to develop aortic aneurysm. The basic defect, which is probably in the structural protein of connective tissue, may be the cause of overgrowth of the long bones.

It has been postulated that President Abraham Lincoln may have had Marfan's syndrome.[4] He was 6-4 and had a longer reach than any soldier in the Union Army. Many observers at the time noticed and commented on his long arms and legs, actually using the word "spidery" to describe them, and his official sculptor was impressed by the huge size and proportions of his hands. Just recently, several members of the Lincoln family have been definitely diagnosed as having Marfan's syndrome. This single dominant gene has apparently been transmitted through 8 or 9 generations.

CHROMOSOMAL ABNORMALITIES

Chromosomal abnormalities have very pronounced effects on growth and development.

Autosomal effects. Trisomy-21, Down's syndrome, or mongolism, is a classic example. Children with Down's syndrome, in addition to being mentally very slow, are quite small. At birth their size is close to normal, but within a year or two they have fallen significantly behind and tend to remain well below the tenth percentile throughout childhood.

THE AUTHOR

Doctor Gall is assistant professor, department of pediatrics and communicable diseases and research associate, department of medicine (Simpson Memorial Institute), University of Michigan Medical Center; and also medical geneticist, Plymouth State Home and Training School, Northville.

Figure 1 shows growth curves for a group of mongoloid children at Plymouth State Home in Northville.[5] It is interesting to note that those who are cared for at home do somewhat better, consistently, than those who were left in the institution at an early age.

Another autosomal abnormality that results in impaired growth is trisomy-18. However, since this condition is almost always lethal within the first year of life, slow growth is a relatively minor problem.

Sex Chromosomal Effects. A large number of sex chromosomal abnormalities are now known. If these are compared according to the presence or

Some conditions associated with impaired growth for which a genetic basis has not been definitely established.

GENETIC BASIS DOUBTFUL

Prader-Willi syndrome (mental retardation, obesity, cryptorchidism)
Smith-Lemli-Opitz syndrome (retardation, microcephaly, multiple minor anomalies)
DeLange syndrome (microcephaly, micromelia, synophrys)
Hallermann-Streiff syndrome (birdlike facies, atrophic skin, thin hair)
Seckel syndrome (bird-headed dwarfs)
Silver syndrome (skeletal asymmetry, cafe-au-lait spots)
Dubowitz syndrome (low-set ears, peculiar facies, and eczema)
Rubinstein-Taybi syndrome (broad thumbs and toes, mental retardation and unusual facies with beak-like nose)
Progeria (Hutchinson-Guilford Disease)
Leprechaunism

Tables compiled mainly from Smith, D. W.[3]

absence of one or more Y chromosomes, an interesting fact appears. The Y chromosome seems to confer added stature.[6] Children with Turner's syndrome (XO chromosome constitution) are abnormally short. The XYY male is often over six feet tall. For some unknown reason, the XYY male also seems to be rather aggressive, and several cases have been found by looking in the wards of the criminally insane for very tall individuals.[7]

NORMAL GROWTH

Polygenic Basis of Stature in Man. The genetic element in the determination of normal growth and development has been obvious down through the ages. Men have always recognized that small parents tend to have small children and tall parents tend to have tall children. However, this common observation was first put on a scientific basis earlier in this century by R. A. Fischer, who worked out the degrees of correlation in size between relatives that would be expected on the assumption of multifactorial Mendelian inheritance.[8] His calculations, which were based on a group of people with a very homogeneous background, tended to underestimate the importance of environmental factors such as adequate nutrition. Later studies[9] have suggested that environmental factors may account for a significant proportion of the variation in human stature. However, the hereditary factor is of preponderant importance, especially in advanced countries.

An additional complication in regard to human size is the existence of a pronounced maternal effect. Small mothers tend in general to have smaller babies regardless of the genetic factors involved. Parental influence on stature has been studied by Garn and others, who have compiled individualized tables of expected normal height and weight based on the sizes of the parents.[6] These provide a more accurate prediction of expected stature than standard height-weight tables.

Biochemical genetic factors. For some reason, there has been a lack of research on the subject of biochemical genetic factors in normal growth. One reason for this lack of research perhaps is the belief that growth is primarily determined by levels of human pituitary growth hormone (HGH), which, until recently, could not be assayed satisfactorily. The availability of assay methods for HGH opens up new fields for investigation of persons with abnormally great or small size, but it is still not known whether growth hormone levels are the primary determinants of stature within the normal range.

Isolated HGH deficiency. One especially interesting result of the availability of assay methods for human growth hormone has been in relation to a rare form of dwarfism known as sexual ateliotic dwarfism. In this condition, birth weight is normal but growth is very slow. Puberty does occur but may be delayed up to 25 years of age. Adult height of affected persons is well under 5 feet. There is no deficiency of TSH, FSH, or ACTH, but McKusick and his colleagues have shown that affected persons are almost completely deficient in human growth hormone.[10] The condition shows an autosomal recessive pattern of inheritance. In one of the families reported by McKusick, two affected parents produced an affected child whose birth weight was normal. This interesting experiment of nature demonstrates that intrauterine growth is apparently not under the primary control of either fetal or maternal growth hormone.

Bodily proportions — Obesity. Growth includes not only total body size and stature, but many additional elements for example, bodily proportions that distinguish tall, thin people from short, stocky ones; relative head size; and amount of body fat. Marfan's syndrome, as we have seen, is a good example of a genetic determinant of a long, lanky body type. Obesity is a more complex problem, since almost everyone has the capacity to become obese given the right combination of underexercise and overeating. However, certain genetically determined conditions are regularly associated with some types of obesity. An example is the Laurence-Moon-Biedle type of mental retardation. Children with mongolism are short and often have a roly-poly appearance.

Special Organs. The growth and shape of the eyes and the teeth are under very strong hereditary control. The story in relation to the eye is particularly interesting, as a recent study[11] suggests that eye measurements, such as the distance from cornea to retina, are almost entirely under genetic control and only minimally influenced by environment (with the exception of course, of destructive eye diseases and direct trauma). It is easy to see in a teleological sense why this is so, since a reasonable degree of visual acuity is absolutely essential for survival under primitive conditions; and this could not be maintained if the dimensions of the eye were subject to large fluctuations determined by environment.

Ethnic genetic factors. There are also racial differences in body size. Although these are to some extent due to the nutritional and other environmental circumstances under which different racial groups live, there is no doubt that genetic factors play a large part. The bodily proportions of the Watutsi, for example, many of whom are over seven feet tall, are genetically determined. The pygmies are genetically small. However, it must be stressed that the body chemistry of such groups has not been adequately studied to see to what extent differences in body size can be accounted for on the basis of known factors.

These, however, are questions for the human biologist rather than the clinical physician. The physician is primarily concerned with pathological growth, and in particular with the child who is too small. Such a child may have a disease that is preventing him from growing. It is up to the clinician to make the diagnosis and begin the proper treatment. An awareness of genetic factors and of inherited syndromes can be of assistance in this respect.

Effects of Early Institutionalization On Growth and Development of Young Children with Down's Syndrome

ABSTRACT: Physical growth as well as motor and mental development of 40 children with Down's Syndrome who were institutionalized in infancy is compared to that of 25 similar children reared by their own parents.

All children are now ages 4-12 years old, have G-trisomy on karyotype analysis, had mongoloid features in infancy and similar birth weights. On the basis of this study and others it is apparent that parents of mongoloid infants should be told that most children with Down's Syndrome will become independent in such self-care areas as walking, talking, eating and toileting by the age of 6; that they will be accepted by day-care centers and special classes in public schools; and that they will attain higher levels of achievement, especially in speech, if they are not institutionalized at an early age.

However, the child with a physical defect which is incapacitating or incompatible with longevity might well be institutionalized if the parents so desire. Parents who elect to maintain their mongoloid child at home deserve their physician's support, encouragement and guidance.

The three co-authors are associated in the Research Department of the Plymouth State Home and the Training School at Northville.

BY CYRUS W. STIMSON, M.D.
ROBERT GEAKE, Ph.D.
HOMER WEIR, M.D.
NORTHVILLE AND PLYMOUTH

By the time they are six years old, most children with Down's Syndrome are capable of walking independently, communicating effectively and caring for most of their personal needs. Communities throughout the nation have established day-care centers and special classes for such children in public schools. Nevertheless, many physicians continue to give parents a feeling of utter hopelessness when they produce a mongoloid child and then advise immediate institutionalization. That such a procedure produces deleterious effects on growth and development of young children has previously been reported.[1-4]

We relate in this article our own observations of 65 children, who are now 4-12 years old, with Down's Syndrome. Forty were institutionalized during infancy and have resided there ever since. Twenty-five are being reared in their own homes by their parents. Twenty children in this latter group are now in day-care centers or public schools.

According to Carter,[5] there are infants with most of the physical stigmata of Down's Syndrome who do not have typical G-trisomy and who in later years have normal intelligence. Early institutionalization of such infants would only lead to iatrogenic mental deficiency. Cytogenetic studies[6,7] are essential to establish the diagnosis of mongolism before institutional placement is considered. The children whose development is reported in this study all have G-trisomy.

METHODS

Among the 200 mongoloid children now in residence at Plymouth State Home and Training School, 40 were found who were admitted to a nursing home or institution during the first year of life and who are now 6-12 years old. These children have been weighed and measured at monthly intervals throughout life and developmental milestones were recorded in the form of progress notes as the children attained them. The 25 children being reared in their own homes have all been evaluated in the out-patient clinic at Plymouth State Home. From our own observations of these children during their visits and from their histories obtained from their parents, it was possible to derive similar measures on members of this group.

Eight measures of growth and development were considered: (1) height and (2) weight as recorded at two year intervals; ages at which patient first (3) walked independently, (4) talked effectively, (5) fed himself with a spoon and (6) became completely toilet trained. Our psychologists determined an intelligence quotient (IQ) using the revised form of the Stanford-Binet and the Wechsler Intelligence Scale for children, and a social quotient (SQ) using the Vineland Scale of Social Maturity for each of the 65 children. The IQ and SQ scores represent measures number 7 and 8.

A simple one-way analysis of variance test was used to determine whether there were any significant differences between the two groups on each of the eight measures. Chromosome studies indicate that all patients have G-trisomy. No patient with normal karyotypes, mosaicism or translocation were considered in this study.

RESULTS

The results are summarized graphically in charts 1 and 2, and the mean values are given in tables I, II and III. The mean IQ and SQ scores for 40 institutionalized children with Down's Syndrome were 17.6 and 29.5, resp., compared to 35.6 and 54.2 for similar children reared at home. These

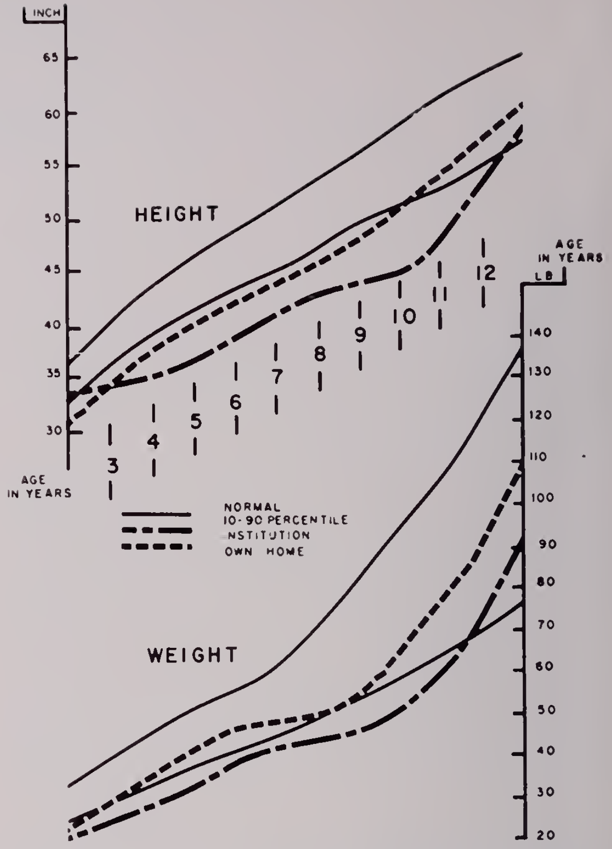

CHART II: Physical growth of institutionalized and non-institutionalized groups of children with Down's Syndrome compared to normal children.

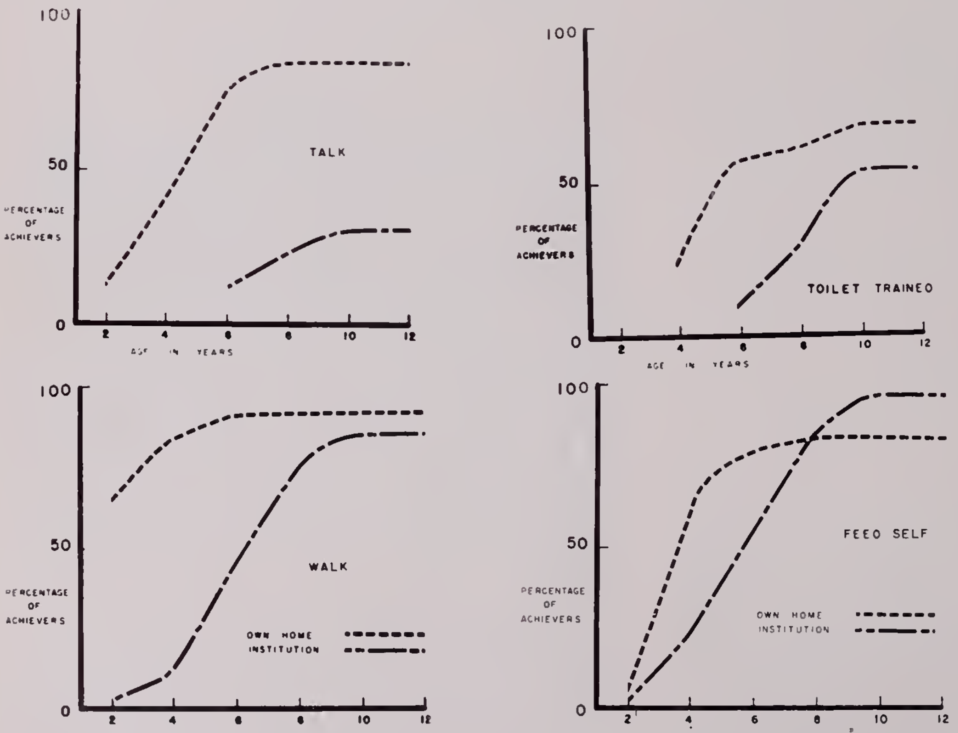

CHART I: Ages at which institutionalized and non-institutionalized children with Down's Syndrome attained four important developmental milestones.

scores reflect the effects of intellectual stimulation, training and experience as well as innate capabilities to learn. The institutionalized children learned to walk independently and feed themselves at a mean age of just over 6 years whereas their fellows reared at home accomplished these at mean ages of 3 for walking and 4 for self feeding. Twenty-one of 40 institutionalized children are toilet trained and they accomplished this at 8 years; sixteen of 25 children living at home completed this training at a mean age of 5 years. Only 10 of 40 institutionalized children are talking effectively and they did not accomplish this until a mean age of 7.8 years. Twenty-one of the 25 children living at home are talking effectively and this was accomplished at a mean age of 4 years. All of these differences are significant at the .01 level.

In general, heights and weights of patients in both groups remain at about the third percentile until age 8 years; they then increase to reach the 25th percentile at age 12 (graph 2). Analysis of variance reveals no significant differences in either height or weight between the two groups. Apparently institutionalization has not produced an effect on physical growth of the 40 children considered in this study. Up to and including age 8 years, our children are similar to those reported by Thelander and Pryor;[8] however, our values for ages 10 and 12 are higher than theirs. Only

TABLE I

Mean Developmental Measures for Institutionalized Mongoloids And Those Living in Their Own Homes

	Institutionalized	Home	Difference *
IQ	17.6	35.6	18.0
SQ	29.5	54.2	24.7
Age Walked (yrs.)	6.31	2.64	3.67
Age Fed Self (yrs.)	6.13	4.26	1.87
Age Toilet Trained (yrs.)	8.57	5.00	3.57
Age Talked (yrs.)	7.80	4.05	3.75

* All differences significant beyond the .01 level

TABLE II

Mean Growth Measures for Institutionalized Mongoloids And Those Living in Their Own Homes

Height	Institutionalized	Home	Difference *
2 years	29.4 inches	29.7	0.3
4 years	34.3	37	2.7
6 years	37.6	41.5	3.9
8 years	42.8	45	2.2
10 years	44.4	51.5	7.1
12 years	54	57.8	3.8
Weight			
2 years	19.1 pounds	21	1.9
4 years	26	34	8.0
6 years	32.7	45.3	12.6
8 years	41.4	45.7	4.3
10 years	48.9	64.0	15.1
12 years	72.7	90.8	18.1

* Differences are not significant

TABLE III

Mean Values of Other Variables for Institutionalized Mongoloids And Those Living in Their Own Homes

	Institutionalized (N = 40)	Home (N = 25)	Differences *
Year Born	1958	1959	1 year
Birth Weight	6.78 lbs.	6.38 lbs.	0.4 lbs.
Ratio Males: Females	18:22	17:8	
Other defects	10 (25%)	4 (16%)	(9%)

* Differences are not significant

eight of the patients considered in our study have attained the age of 12 years while 16 have reached the age of 10. While this small number of cases allows comparison of the institutionalized to the non-institutionalized groups of patients at these ages, the number is insufficient to conclude that the height and weight of mongoloid children approaches normal values at age 12 years as suggested by the graph.

Other variables, including year of birth, birth weight, sex and presence or absence of other defects, were considered to determine whether the patients constituting the two groups were similar. The available data indicates that they were (table III).

DISCUSSION

When parents receive the shattering news that their offspring is afflicted with Down's Syndrome, one of their first questions is "Should we take the child home with us?" In the past, physicians have often advised the parents to place the child immediately in a nursing home or institution and try to forget it, and even to tell the other children and relatives that the child died! Such a procedure is detremental to the child and parents alike. We have never encountered parents who were able to forget. Those parents who did follow this procedure developed strong guilt feelings which were often more harmful to the marriage and other children than the presence of the afflicted child in the home would have been.

We realize that some families would not survive with a mongoloid child in the home and endorse the philosophy of Birch and Belmont[9] that antiplacement rigidity is no sounder than proplacement stereotype as a basis for the early management of mentally defective children. We feel that the following procedure is sound whenever parents and their physician are considering the placement of a mongoloid infant in an institution for the mentally retarded.

1) Cytogenetic studies are done to substantiate the diagnosis. Children with normal karyotypes, mosaicism and even translocation should not be institutionalized, on the basis of mongoloid features, unless at age four or five years they are found to be severely retarded.

2) The parents are told that (a) most children with Down's Syndrome will be able to walk, talk, feed and dress themselves and become toilet trained by the time they are six years old and that day-care centers and special classes in public schools are accepting such children. As small children, mongoloids present the same problems of care that normal children do. While it is true that children with Down's Syndrome are susceptible to respiratory and skin infections, such infections respond well to medical treatment. Unless the infant has a symptomatic heart defect or other incapacitating congenital anomaly, his care will be very similar to that of normal babies. (b) If the afflicted child is raised in his own home his motor and mental development will be closer to normal than if he were raised in an institution. The average IQ of school-aged children with Down's Syndrome who are raised in their own homes is 40 compared to 20 in institutionalized cases. Thus, for the good of the afflicted child, parents are urged to maintain the infant at home at least until he is 6 or 7 years old. (c) Like all children, those afflicted with Down's Syndrome need emotional support and intellectual stimulation during their formative years. Children with Down's Syndrome are most responsive to love and affection; they are demonstrative and capable of giving their parents a great deal of love and satisfaction.

3) If the child is born out of wedlock or the parents express no interest in further involvement with the child, a suitable foster home placement may be possible.

4) Patients are accepted as guests to our institution for a short period when their presence in their own homes would be devastating to the family. This gives the parents a chance to work through their problems with whatever help we can offer away from the immediate stress caused by the presence of the afflicted child in the home.

5) We may advise a period of institutionalization for those children who have other congenital defects which are not immediately correctable and which make care unusually difficult for the parents. During this period the child will be evaluated by our consultants to determine the feasability of correcting the deformities so that the child may return home.

6) If the child should have an uncorrectable defect which is also incompatible with longevity, we will advise institutionalization if the parents are uneasy about caring for the child.

In spite of our attempts to support in any way we can those parents who are willing to try to maintain their mongoloid child at home, we still find it necessary to admit some young children with Down's Syndrome to the institution. We are now trying to impress on our ward personnel the importance of talking to the children and of using their own ingenuities and natural mothering instincts so as to encourage the early motor and mental development of our patients. Because of more intensive programming, our patients are developing at a better rate than did patients five or six years ago; but they are still not doing as well as their fellows who were fortunate enough to be reared in their own homes.

SUMMARY AND CONCLUSIONS

1) Twenty-five children with Down's Syndrome who are now ages 4-12 years and reared in their own homes by their parents, learned to walk and talk at a mean age of 4 years; they were toilet trained and able to feed themselves at 5 years. Twenty of them are now enrolled in special classes in public schools or day-care centers. Forty similar children who have been institutionalized since infancy learned to walk and feed themselves at a mean age of six years and talk and care for their own toilet needs at 8 years; only 10 of the 40 institutionalized children are able to talk effectively, presumably because of lack of speech stimulation. Statistical analyses indicate that the differences between these two groups are significant at the .01 level of confidence on all measures.

2) Twenty-five children with Down's Syndrome who were reared by their parents now have a mean IQ of 36 and SQ of 54; the 40 children institutionalized in infancy have a mean IQ of 18 and SQ of 29. Statistical analyses utilizing analysis of variance, indicates that these differences are significant at the .001 level of confidence.

3) Physical growth as indicated by height and weight at certain ages follows the third percentile until age 10 when it approaches the 10th percentile and then proceeds to the 25th percentile by age 12. Differences of physical growth between institutionalized and noninstitutionalized children are not statistically significant.

4) Physical stigmata of Down's Syndrome can occur in individuals with normal intelligence. In as much as early institutionalization may produce irrevocable damage to such individuals, chromosome studies are essential in order to substantiate the diagnosis before any long-term plans are made.

5) The young child with Down's Syndrome will not present unusual problems of care to his parents unless he has certain congenital defects. He will respond appropriately to love, training and intellectual stimulation. He will be ambulatory, verbal and independent in self care activities by the age of six years. There are school and day-care programs in most communities which will accept him.

6) The child with an incapacitating physical defect or a defect which is incompatible with longevity may be institutionalized. If the defect is corrected and the child regains his capacity of functioning, he should return to his own home.

7) Parents are more willing to raise their mongoloid child if they have the support, advice, and skill of their family physician to guide and encourage them.

8) Physicians and other professionals in institutions must set an example and thereby impress upon the minds of ward personnel, the importance of talking to the residents as the best way of stimulating speech development. Failure to do this allows the children to develop into beings who communicate only by grunts, crys, gibberish and gestures. Children in institutions should be encouraged to walk by themselves and care for their personal needs as soon as they are able to learn.

THE AUTHORS are grateful to members of the departments of medicine, social service, psychology and nursing at Plymouth State Home and Training School who have recorded a wealth of information about our patients; to Miss Judith Stack, M.T., A.S.C.P., James Alston, Noble Kheder, Mrs. Barbro Hicks and Ronald Wilson, B.F.A., P.P.A. and R.J. Giesige, Jr. for technical assistance; to Mrs. Barbara Gariepy of Wayne State University Computer Center; and to Miss Kathy Hoye who typed the manuscript.

Editorial Note:

The problem of advising the family with a child with Down's Syndrome is a very difficult one. It is fraught with many perils including that of the physician's own emotional make-up. The author certainly gives us food for thought.

A STUDY OF ITS EFFECT ON 50 FAMILIES

Severe Asthma in Children

JAMES A. McLEAN, M.D.
JULES SCHRAGER, M.S.W.
VICTOR R. STOEFFLER, M.S.W.
ANN ARBOR

While many advances have been made in knowledge of the factors causing bronchial asthma as well as in the various allergic, pharmacologic and emotional treatment modalities available, there still remains a "hard core" of asthmatic children who experience severe, chronic, intractable asthma which is resistant to present forms of therapy.[1]

Considerable thought has been given to the reasons for this intractability in certain children's asthma. Various members of the health profession have shared a common concern regarding the treatment of these asthmatic children.

The allergist or pediatrician seeing the child in the office, clinic, home or hospital is frequently impressed with the resistance to treatment which characterize this patient population. Resistance in this sense is construed as any response to a therapeutic regime which does not yield satisfactory improvement, i.e., little or no amelioration of the asthma. Thus, a patient's lack of response to one or another antibiotic and pharmacologic regime (with or without steroid therapy), dietary schedule, hyposensitization, avoidance program and hospitalization constitute one pattern of resistance. Similarly, a parent's inability to carry out a prescribed program adequately constitutes another form of resistance.

Quite commonly it is observed that there appears to be an interdigitation of the forms of resistance. The psychological and emotional interactions between children and parents, the emotional climate in the home and community, and the degree of stress (e.g., separation experiences, periodic changes in environment, school failure, economic instability, etc.) all may conduce to the development of a situation within which the most effective medical management risks failure.

In order to begin to explore the dimensions of the problem and develop some guidelines for continuing work, an exploratory project was undertaken by members of the Allergy staff in collaboration with the Department of Social Work, University of Michigan Hospital. The charge given to the investigators was as follows: To interview and collect data on a sample of families whose family physician considered their child to have severe chronic asthma, the sample to be drawn from various areas of the state on referral by physicians in private practice. The specific objectives were twofold: (1) to further document the existence of a significant number of children with severe, chronic asthma; (2) to describe the impact of such an illness on the family constellation and its functioning.

Practicing allergists and pediatricians throughout the State of Michigan were initially contacted by letter informing them of our proposed investigation and inviting their participation, requesting (1) that they provide the names of families in their practice having an asthmatic child who, in their judgement, had severe asthma and was resistant to treatment under present circumstances or manageable only with chronic steroid administration and (2) inform the families of their (the doctor's) participation in this project and encouraging the families' cooperation. In this fashion, 23 physicians identified 62 such families, and the first 50 were interviewed.

Form letters were then sent to the families requesting their assistance in this project, referring to the family physician by name as the source by which they became known to us. Simultaneously, the referrals were organized by geographical distribution and contacts made by the Department

Doctor McLean is professor of internal medicine at the University of Michigan Medical Center; Mr. Schrager is director of the department of social work, University Hospital, and assistant professor of the U-M School of Social Work; Mr. Stoeffler is assistant director, department of social work, University Hospital, and clinical assistant professor, department of psychiatry, U-M Medical Center. John M. Sheldon, M.D., now deceased, assisted in the early preparation of this paper while director of the U-M Medical Center Section of Allergy. The study was supported by a grant from the Michigan Tuberculosis and Respiratory Disease Association.

of Social Work with professional colleagues in social agencies and child guidance clinics in proximity to the family residence. In this manner a team of interviewers was recruited, all having appropriate professional preparation for undertaking this task.* A mimeographed questionnaire was developed by the Department of Social Work, University of Michigan Hospital, and the Allergy staff around which could be conducted a structured interview, and these, with full instructions regarding their use in obtaining additional material which appeared pertinent during the interview, were sent to all of the interviewers.

By telephone contact, each interviewer then introduced himself to the family, referring to the family physician and the University as his sponsor and requesting an appointment to conduct the interview. All interviews were carried out in the family residence, with both parents in attendance in the majority of cases and often with the children in and out of the setting.

Accompanying each questionnaire was a rating sheet to be completed by the interviewer concerning the effect of the child's asthma on the family. This consisted of six items: effect on family economy; effect on other siblings; effect on parents' ability to cope with the child and his illness; effect on the total household; effect on patient's schooling; and effect on patient's relationship with his peers. These were graded on four degrees of severity: no effect, some effect, severe and very severe.

Interviews and rating sheets were mailed to the University Hospital whereupon three additional raters (the senior authors), employing the same measures, independently rated each case. In making a decision, each rater reviewed the 15-page questionnaire in its entirety and then again for the specific factors listed above. An assessment was made in this context, and scores were then assigned to each item on the rating sheet: no effect equaled 0; some effect equaled 2; severe equaled 3; and very severe equaled 4.

DESCRIPTION OF THE SAMPLE STUDIED

The 50 children referred by physicians were divided into age groups: Group 1 (3-6 years), N=12; Group 2 (7-10 years), N=21; Group 3 (11-14 years), N=15; Group 4 (over 14 years), N=2. (Table I).

Thirty-one children in the sample were males, 19 were females. Thirty percent of the referred group were first children. (Table II).

Viewed in terms of racial distribution, the group was representative of the population of the state as a whole — slightly less than 10 per cent of the sample being Negro. It should be pointed out, however, that this figure would vary widely in different sections of the state, since the Negro population is mainly concentrated in the larger urban centers.

Each referral was rated in terms of the social class position of the father. In assigning a social class position to each family, the indicators used were employment and education of the breadwinner. The basis for this choice is found in the work of Hollingshead and Redlich[2] & of Harrison, et. al.[3], in their work on social class and mental illness in children. Five social classes were identified: Class 1 (unskilled or unemployed), N=12; Class 2 (skilled labor), N=13; Class 3 (lower white collar), N=14; Class 4 (upper white collar), N=4; and Class 5 (professional or executive), N=7. (Table III).

Of the 50 children in the group, more than 60 per cent came from families with three or more children. (Table IV). Six of these families were single parent families, due either to divorce, separation, or death of one of the parents.

---

* Although there was some predictable unevenness in the skill of the interviewers, all eight were professionally trained at the Master of Social Work level and all were members of the Academy of Certified Social Workers.

Thirty-five of the children came from families in which there was a clear-cut history of allergic disease, 20 of these families having bronchial asthma as the manifestation. (Table V). Sixteen of the asthmatic children had, or had had eczema, and eight of these children also experienced hay fever. In 24 of these children, food elimination diets were being carried out for present or suspected food sensitivity, and this was questioned in six additional children.

MEDICAL ASPECTS

Significant family history of allergy	35
Significant family history of asthma	20
Associated atopic eczema	16
Associated hay fever	8
Food allergy found or suspected	24
Infections appeared important	32
Steroid therapy ("Burst" or continuous)	25

TABLE VI

COURSE OF ASTHMA

ONSET	Birth - 13 years
Mean	2.8 years
Median	1.5 years
DURATION	1.5 - 16 years
Mean	6.1 years
Median	6 years
SEVERITY	
Moderate to severe	10 patients
Persistently severe from onset	15 patients
Severe to moderately sever (steroids)	19 patients
Variable severity	6 patients

Infection seemed to be a very important factor in triggering or perpetuating the asthma in 32 children, 18 of which seemed to have a "cold" or infection much of the time and had received multiple courses or continuous antibiotics. All of the children had received or were receiving some type of hyposensitization therapy.

The onset of asthma varied from birth to 13 years of age, the mean age of onset being 2.8 years and the median being 1.5 years. The duration of asthma ranged from one and one-half years to sixteen years, the mean being 6.1 years duration and the median being 6 years. (Table VI).

Although all the children in this study were considered to have severe chronic asthma by their family physician or pediatrician, different degrees of chronicity and severity were evident at the time of the visit by the research interviewer. All of the children were or had been severe chronic asthmatics. At least 19 of the children were experiencing only moderately severe asthma at the present time due either to steroid therapy or partially effective medical management. Twenty-five children were on either "burst" or continuous steroid therapy. Ten of the children had experienced only moderately severe asthma at the onset and then progressed to severe and chronic symptoms while 15 had been severely asthmatic from the beginning. The remaining six children were characterized by asthma of variable severity.

RESULTS

EFFECT ON FAMILY ECONOMY

Within the limits of this study, we have tried to evaluate the economic impact of severe asthma in a child upon the family organization. Table VII provides some evidence of this effect. In our sample, the costs of medications ranged from $3.00 per month to $166.00, with 19 families paying more than $31.00 per month.* This study indicates that the higher costs seem to be borne by persons who are in the higher income bracket ($8,000.00 plus).** (Figure 1). Given the fact

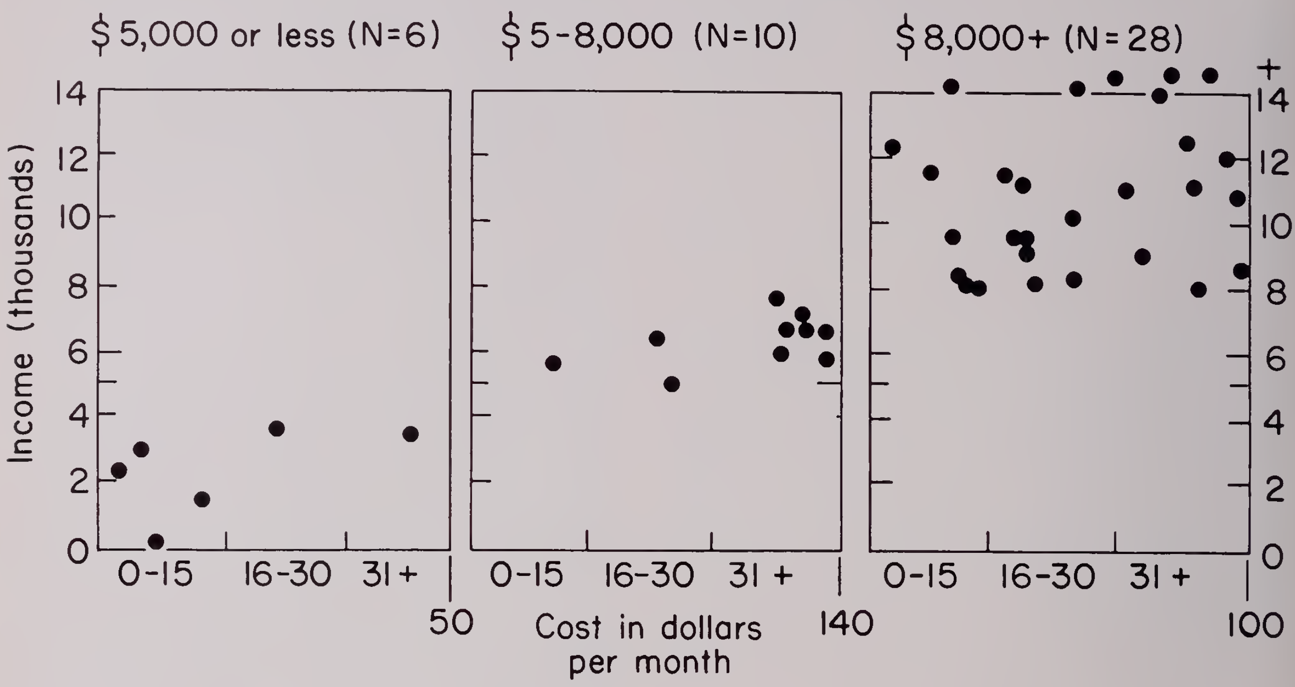
---

* The questionnaire used by the interviewers did not include a question regarding doctors' fees specifically but only the cost of medications; in some cases this included the cost of hyposensitization and epinephrine injections. Professional fees must be added to the amounts indicated above in order to arrive at the true picture of total medical management.

**Figure I contains 44 families whose income was stated. Table VII lists a total of 47 families whose medication expenses were known.

Figure I

EXPENDITURE FOR MEDICATIONS VS. FAMILY INCOME



that all children (with one exception) were seen by private physicians and all were referred on the basis of criteria which were applied equally, it is difficult to understand why higher costs were distributed in this fashion. Further analysis showed, however, that higher medication costs also could be related to the severity of the asthma. Reviewing the income ranges (as grouped in Figure I) vs. asthma severity, it can be seen from Table VIII that 50 per cent of the children from families with income of less than $5,000 per year were severe asthmatics, 70 per cent of the children in families with income from $5,000 - $8,000 were severe and 53 per cent of the children in families with income above $8,000 were severe asthmatics. Thus, it would appear that higher expenditures for medications by those families with a greater income may be partly but not entirely dependent on the severity of the asthma, but also related to income.

In 12 families both parents were employed. Significantly, of these 12 families, four earned less than $7,500 as the combined income of both parents, and their expenditure for medications for the asthmatic child ranged from $33 to $137 per month ($396 to $1,644 per year). Thus, unusually high expenditures struck that part of the sample least able to pay for service, and one could assume that the effect of this drain on the resources of these families must have had deleterious effects on the family as a whole.

TABLE VIII

ASTHMA SEVERITY VS. INCOME

Asthma Severity	Income less than $5000 per year	$5000-$8000	$8000+
Severe	3	7	15
Moderately Severe	3	3	13

One family paid a minimum of $25 a week for medical expenses and had gone bankrupt twice. Thirty-one of the families had purchased some type of special equipment for the home such as a dehumidifier, air filter, air conditioner or croup tent for the child's bedroom. Thirteen of the 31 had purchased two or more pieces of such special equipment. Most families, with the exception of five, did not suffer any significant economic hardship because of the hospitalization of the child. This was usually covered by insurance or by monies available through public sources. The stay in the hospital, although relatively short (generally under two weeks), simply represents a suppression of the acute crisis.

Although this study was based upon a small sample (and a rather selective one since all subjects but one were referred by private physicians), one can suggest that the evidence indicates that the effect of asthma in children upon the economic well-being of the family is appreciable.

EFFECT ON OTHER SIBLINGS

Review of the questionnaires revealed that children in some families resented the extra personal attention the asthmatic sibling required. This was found to be true in 16 of the 44 families with more than one child (36 per cent). There were 25 families in which this was not a problem and three families in which this was undetermined. The other siblings protested also the manipulative way in which the ill child demanded the attention of the parents or other members of the family. This was particularly true when the child was acutely ill and needed special care and attention from the parents, especially the mother. In three families siblings felt guilty about the asthmatic's condition in that they may have been "responsible" (through active play or some other kind of interaction) for the onset of an acute attack. It should be noted, however, that this information was not uniformly inquired about in the course of the interview but was offered spontaneously by the informants.

The parents of 17 families reported that their child-patient became irritable and crochety when suffering from the effects of an asthma attack. Whining, complaining, and aggressive behavior directed at others, including siblings, made them quite unpopular and to be avoided when symptomatic. The ensuing social isolation of the asthmatic child in turn may produce additional anger and guilt on the part of other members of the family social system.

EFFECT ON PARENTS

The child's asthma presented rather severe problems for some parents in essentially two ways: handling the physical and concrete realities of the disease; and handling the behavior of the child within this context. In 14 families at least one of the parents felt frustrated and bewildered. Twelve families reported work-time lost because of the child's asthma, and in four families this was a significant amount (1½ days a week in one family, "much work time lost" as contrasted to "little" in others). Thirty-seven families reported loss of sleep because of the child's asthma with one-half of these (18) reporting on the average of at least one hour per night lost. They realized that the care they gave to the ill child often took their attention from other members of the family who felt "short changed."

Parents become concerned about the child's activity at home and at school and how this may affect his health. Most parents would consciously wish that the child could run and play like other children but at the same time do not want the child to become overtired or involved in activities which might precipitate an asthmatic attack. They feel that the price they and the child might pay for taking undue risks is too great, and they would rather "play it safe."

Many parents (30 families) have a difficult time in coping with the child and his illness because they fear that their normal, spontaneous attempts at discipline might be contraindicated. Frequently this results in a "double standard" of discipline; one for the asthmatic child and another for the well child. They fear that punishment and restriction will upset the child and cause an attack of asthma; and so they refrain from employing their parental prerogatives. The parents feel frustrated because they feel that the child has manipulated them and guilty because they are not being consistent with other children in the family.

EFFECT ON TOTAL HOUSEHOLD

The existence of chronic asthma may have its disabling effects on the entire household because the disease and its consequences, rather than the needs of all the individual family members, may dictate the adjustment of the family unit in many areas of living and over an indefinite period of time. In half of these families activities were frequently curtailed or abandoned because the asthmatic child could not participate, and thus the whole family suffered from the restriction. For example, some families would not go where it might be dusty, or where a heavy pollen or dander exposure was likely. Wet, damp weather is often an inhibitor of activities whether they be routine, recreational or pertaining to school. Parents are unwilling to leave at home a child who is acutely ill and reluctant to hire a baby sitter to stay with the child for fear that a crisis might arise during their absence. Hence, many families are bound pretty close to home when they might ordinarily choose to do otherwise. For a few families, repeated hospitalization of the asthmatic child draws the parents (especially the mother) physically and psychologically from the home and the other siblings.

EFFECT ON PATIENT'S SCHOOLING

Eighteen children missed more than 20 days of school per year. Some children were good or excellent students, and being absent from school for repeated or extended periods of time did not seem to have an adverse effect on their academic performance unless of course those students who were described as "average" could have become "good" students if they had missed less school. Table IX shows that the majority of "poor" students actually missed less time than the "good" and "average" students. Other reports have shown that the intelligence of asthmatic children is representative of the general population. The number of students in the "good," "average" and "poor" performance categories in Table VIII is in accord with this observation. Twenty-five of the children had to restrict their school activities because of asthma. For example, they had to stay inside the school on damp or wet days when others could be outside. Gym and playground activities were not allowed or were limited.

TABLE IX

SCHOOL PERFORMANCE VS. SCHOOL ABSENCE

SCHOOL DAYS MISSED	TOTAL	STUDENT PERFORMANCE "Good"	"Ave."	"Poor"
0 - 10 days	13	5	5	3
11 - 20 days	7	4	2	1

61 +	2	1	1	0
Unknown	3	0	1	2
Not applicable (Children not school age)	9			
TOTAL		16	17	8

EFFECT ON PATIENT'S RELATIONSHIP WITH PEERS

As a group, these children were not particularly undesirable as companions, nor did they have characteristics which were offensive to their peers. At least none was discernible from this study, except for irritability and complaining when having asthma.

DISCUSSION

It was observed that the child with severe asthma had varying effects on the family. Although many of the families found that the economic burden was very severe, the cost of hospitalization was lessened considerably by insurance programs for some of the families and public sources (Crippled Children's Commission and the State Department of Social Services) of support for others. It was observed, however, that 19 of the families paid more than $31 per month for medications. While higher income families paid more for medications, this cost did not necessarily reflect the severity of the asthma, since all income groups had children with severe asthma. Too, these families were better able to bear the cost of the medical regime recommended.

In the lower income groups, this financial burden certainly could have contributed to the "worry" over the chronic asthma. Regarding the 12 families with both parents employed, it is uncertain whether or not 24% is an unusually high figure for dual employment as contrasted to the total working population, but it would appear that the asthma cost could be a contributing factor to the necessity for dual employment in the families in this study.

While it has been shown previously that social classes 1 and 3 (as outlined above) are economically most vulnerable in our social system,[3] it should be noted that there were seven children with intractable asthma from professional and executive families in this study. While chronic asthma did not seem to have any relationship to social class, the economic effects were more profoundly felt by families from the lower socioeconomic groups.

Besides 36 per cent of the families with more than one child noting resentment by the other siblings over the extra attention given to the asthmatic child, problems in handling the behavior of the asthmatic child and his siblings were noted in 30 of the families (60 per cent). On the other hand the data indicate that the majority of families were apparently able to handle the asthmatic child and his brothers and sisters fairly adequately, and that these asthmatic children were able to keep up with the "average" school performance.

The impression is gained from reviewing the questionnaires that families felt considerable hardship at the time of onset of the asthma, and during the time when the asthma was being brought under partial control. When control was not achieved or was intermittent at best, stress was felt more continuously.

After a period of "reprieve" from acute symptoms and the need for intensive care, the family again felt the original strain at the onset of each exacerbation of asthma. Although the family may have been greatly inconvenienced when they lost sleep, had to pay a great deal for medicine and had to restrict the child from school and activities and even hospitalize him, after the symptoms subside they seemed able to return to a somewhat more normal routine. The continuation of subacute attacks, however, may have influenced the family's ability to adapt and manage the illness and the other children.

The total family may have experienced possible disruption in other ways. Feelings of uncertainty by the parents, both as to the medicines used in treatment and their own inability to help the sick child, reinforced the feeling of helplessness. Added to these factors are the resultant curtailment of the child's and family's activities and the problems of maintaining both love and discipline for all the children within the family.

The effects of these influences became unmanageable in some cases and become further complicated by the emergence of problems in siblings which might not have been precipitated if the total family situation were more "normal."

"Intractability" or "resistance" to treatment may be related at times to some of these factors. Programs for the management of such asthmatic children should take into account the total family. Therapeutic counseling for the family constellation has been recommended by others in the treatment of the institutionalized asthmatic child,[4] and our report has indicated that social factors appear relevant in many of these families of severely asthmatic children who were not institutionalized. On the positive side it should be noted that many of these families were apparently carrying on very well despite the potentially disrupting influence of the severely asthmatic child.

SUMMARY

The families of 50 children with severe, chronic asthma have been surveyed by social workers. The following parameters were specifically investigated: effect on family's economy; effect on other siblings; effect on parents' ability to cope with the child and his illness; effect on the total household; effect on patient's schooling; and effect on patient's relationship with his peers.

Thirty-three of the families had a cost of $15 per month for medication expenses with 19 families paying more than $31.00 per month. Thirty-six percent of the families with other children noted sibling resentment toward the asthmatic child. Fourteen of the families felt bewilderment and frustration due to the chronic illness, and 30 families experienced difficulty in coping with the asthmatic child. Family activities and school activities were influenced in half of the cases. In addition, work-time and sleep-time loss were documented. In some families among this selected group of chronic asthmatic children, a total treatment program would appear to necessitate social and psychological, as well as medical aid.

The Treatment of a Psychiatric Emergency In a University Hospital Setting

ABSTRACT — One of the responsibilities of a University Hospital is the evaluation and appropriate management of psychiatric emergencies. A conceptual model of an "ideal" emergency program is presented, and a structural format for dealing with emergencies is outlined. The structure includes: a telephone service, a walk-in service, a crisis intervention clinic, a consultation service, and a flexible use of inpatient beds. The implications of the service-training-research triumvirate is discussed here in the context of the residency program.

BY PHILIP M. MARGOLIS, M.D.
JAMES M. ANDRE, M.D.
BOTH OF ANN ARBOR

INTRODUCTION

A 17-year-old boy was seen recently in the Emergency Room of a local hospital because he took an overdose of tranquilizers. A psychiatrist did not see him. He was given sedatives, and sent home with his brother who left him at the home of friends. It was suggested that he see a psychiatrist, though this information was communicated only to the boy.

Two days later, I received calls from the school nurse and the school principal who were concerned about his alternating violence and somnolence. He was brought into the University Hospital Emergency Room, was seen by a psychiatric resident who chose not to admit him. The Neurology resident was furious, but admitted the boy to the Neurology service. He was finally transferred to the psychiatric unit 24 hours later.

A University Medical Center has certain responsibilities — both to itself and to the extra-mural community of which it is a vital part. Many University Medical Centers are ambivalent about providing psychiatric emergency services, and departments of psychiatry are no exception. The decision — to provide or not to provide — rests upon many factors, not the least of which is the Department of Psychiatry's conception of its function. A University (General) Hospital is a logical focus for a community mental health center and should offer crisis-emergency services — a vital part of community mental health operations. A department of psychiatry must define, delineate, and assume the emergency responsibility for a community; the buck stops here!

OUR PAPER TODAY is not research. Rather, it precedes research — it lays a foundation upon which to build a concrete house for research.

Theoretically, the crisis school of psychology is gaining adherents. The theory posits that dealing with acute emotional crisis (a crisis = an upset in a steady state — Caplan), and with the acute phase of emotional illnesses often serves to deter or prevent chronic mental disease, at the same time building ego strength to better handle future psychic traumata. Preventive approaches, specific goal-directed (short-term) treatment, centering upon the current life situation, all are beginning to submit to and bear up under the wary eye of scientific scrutiny.

DEFINITION AND LITERATURE

An emergency can be defined in any number of ways. Anyone who phones, anyone who "walks in," anyone who is referred to the emergency service, could be automatically classified as an emergency patient. Shurley and Pokorney suggest that an emergency is always sudden and unexpected, always requires immediate attention to prevent serious damage. In essence, an emergency is defined by the urgency of the need to respond. This urgency can be felt by the patient himself, by his family, by the police, etc. Brothwood makes the crucial point that whatever the definition, the prompt assumption of clinical responsibility for the patient is expected and demanded.

In a national study of patients presenting themselves to the emergency room (6842 patients in eleven Emergency Centers), 27.3% were considered to have frank entirely psychiatric illnesses (and symptoms); another 25% manifested concurrent psychologic and "organic" — physical difficulties. Thus, at least half the patients presenting themselves for emergency care had either major or minor psychological distress.

ALTHOUGH DANGER TO self and/or others appears to be the most crucial criterion of a psychiatric emergency, we have somewhat arbitrarily divided the emergencies into six possible types: (1) suicidal — depressed; (2) homicidal — aggres-

---

*Presented at the Research Symposium on Psychiatric Emergencies at the University of Michigan Medical Center, October 5-6, 1967.

sional (overt violence is rare in the emergency room); (3) psychotic — reality breakdown; (4) panic — anxiety; (5) organic — confusion — delirium (e.g., drinking, drugs); and, (6) family and environmental intolerance.

As examples of the wide diversity of diagnostic categories which are (also) classified as psychiatric emergencies the suicidal, homicidal, and "excited" patients are compared. The suicidal patient may be depressed, schizophrenic, hysterical, sociopathic, or anxious. The homicidal patient may be paranoid, sociopathic, or schizophrenic. The "excited" patient may be acutely anxious or panicky, manic, catatonic, or hysterical. The "proper diagnosis" is, of course, secondary to an awareness and evaluation of the "emergency state," and the level of behavioral control is often its determinant.

"IDEAL" STRUCTURAL MODEL

Whether an emergency service is centralized, i.e., administrated and to some extent geographically represented under one aegis or whether it is "appropriately" distributed and as it were decentralized, is a moot point and depends on local issues, political and otherwise. Philosophically and technically, we favor a central locale, an integrated cohesive unit as close geographically and emotionally (attitudinally) to the medical-surgical-general emergency area as possible.

The ideal model contains five essential elements:

1. A 24-hour telephone service which should have a special Crisis-Emergency (CE) number, well publicized. This unit has five functions:
    (a) Suicide prevention.
    (b) Support, guidance, classification and advice.
    (c) Consulation.
    (d) Information.
    (e) Referral.

2. Walk-in Service (e.g., walking into the Emergency Room). Some walk-in centers are really trouble centers, handling both major and minor "disturbances"; many are store-front operations in the heart of a slum area — indigenous of the community; only a few such as Bellak's Trouble Shooting Clinic in New York City are attached to and a part of a general hospital.

3. A Crisis Intervention Clinic — four to six closely spaced outpatient interviews. A crisis team may make home visits.

4. Consultative Services.

5. "Back-up" Inpatient beds to be utilized on a flexible basis. Three units are envisioned:
    (a) For the patient to be held 4-6 hours.
    (b) For the patient to be held 24-72 hours.
    (c) For the patient to be held 1-4 weeks.

Implicit in these five elements is the concept of a collaborative-cooperative-liaison relationship with the agencies and institutions of the community. For example, collaboration assumes that an appropriate referral may be made with reasonable expectations that it will be successfully consumated.

The success or failure of an emergency service depends upon the flexible use of skilled personnel. The staff should be multidisciplinary, with both distinctive and overlapping skills, including a psychiatrist, a social worker, a nurse, a psychologist, a trained mental health worker, a secretary, and (perhaps) volunteers.

OUTPATIENT CLINIC — INNOVATION

Beginning July, 1967, the Psychiatric Outpatient Department of the University of Michigan Hospital undertook to improve service to the community, and at the same time broaden training experience for its residents, and to increase social research opportunities. The change involved a grouping and coordination under the direction of a senior staff psychiatrist, resident emergency psychiatrist, and a psychiatric social worker.

First, the team coordinated the emergency services of the Outpatient Department from 8:00 a.m. to 5:00 p.m. weekdays with identical services provided by the resident on call (ROC) evenings and weekends. An initial step was to establish brief meetings between the resident EP and the ROC twice daily. Here valuable information affecting proper services for the patient was communicated both ways.

Secondly, the resident EP manned the telephone. Incoming calls are received from patients, agencies, doctors, and relatives. Previously, entirely handled by the psychiatric social worker (who now serves primarily as a consultant on community resources), the resident takes calls requesting information, advice, and appointments for evaluation, reassurance, and possible admission. He attempts to assess the caller's needs and strengths, and makes appropriate plans for disposition. Often support, reassurance, and guidance lessen the urgency of the caller.

FOR TRAINING PURPOSES and for establishing links with the medical community, it is appropriate that the psychiatric resident take the initial telephone call.

Often communication is facilitated by a doctor-to-doctor contact. The mother of a patient hospitalized elsewhere came to the clinic requesting transfer of her daughter to our hospital. A brief interview enabled the resident EP to ascertain that the mother was reacting with strong feelings of being excluded because she had had no contact with her daughter's psychiatrist. Not only was she encouraged not to interrupt her daughter's therapy, but a call to the daughter's psychiatrist helped secure an interview for the mother.

The resident EP sees all walk-ins to the outpatient clinic and to the emergency room. The requests for help are similar in type to those received over the phone, but the presenting problem and need are more acute. Another area of service provided by the resident EP is emergency consultations to other services within the hospital. Though the immediate need is for management, there are opportunities to assist in making definitive, long-term plans to help the patient.

TIME, EXPERIENCE, AND improved communications are necessary to solve a number of problems. Almost immediately, we experienced difficulties with hospital administration policies which control setting of fees. This problem is especially poignant for the walk-in who needs to talk briefly with the resident EP. However, the policy directs that the walk-in register, pay a fee, and *then* see a doctor. Another problem is the need for short-term crisis intervention beds, perhaps two to four beds designated for such use by the resident EP. Within the general community problems also exist, e.g., the reluctance of some agencies and physicians to accept certain referrals.

PROBLEMS IN COLLABORATION and coordinating services among existing agencies must be worked out. An example is the similar, but separate and uncoordinated efforts of the various student mental health services within the university community. The student from out of state, living alone, having few friends, and in psychological, social and legal difficulties requires a solid community team effort.

Some recently collected data is used to illustrate the contacts made by the resident EP and the psychiatric social worker. In the first six-week period there were 223 contacts involving 182 cases. Of the 182 cases, 49 were seen personally and 133 handled over the phone. Without offering a complete breakdown of data, it is interesting to note the following: Of the 49 seen personally, the largest number were self-referred (1/3); 1/5 were referred by the emergency room.

If psychiatric staff were "stationed" in the emergency room, it is likely that more patients would be seen and appropriate disposition made right then and there. Additional advantages are obvious,

CO-AUTHORS

Doctor Margolis is professor of psychiatry, University of Michigan Medical School; Chief of Social and Community Psychiatry; Director of Washtenaw County Community Mental Health Center; Doctor Andre is a resident, Outpatient Department, University Hospital.

ANDRE

MARGOLIS

including improved communications and relations with the rest of the medical, university, and outside communities. The authors have had "emergency" calls from mental health professionals, patients, and relatives about the patient having been seen in the emergency room for "physical complaints," then having been sent home without their "psychological distress" having been checked out by a psychiatrist.

After the initial contact, 1/4 of the patients were able to accept a routine appointment, and another 1/4 were able to follow through a referral to another agency. In these instances, a short but definitive personal interview effectively screened the "emergency."

Of the 133 cases handled over the phone, the observations are similar. The largest number (2/5) were self-referrals; a significant number (over 1/4) were referred by physicians. Here the data suggest that after initial contact with the doctor, the caller was most often able to accept a routine appointment (over 1/2), or information and recommendations (1/3).

A limited "follow-up" study suggests that the emergency disposition made by the resident EP was successful. Of 92 patients given appointments over this period, only 12 failed to keep their appointments. Of 20 referrals made to other agencies, only 3 patients failed to carry through. Of 51 patients given information and recommendations, 49 considered the information helpful and followed the recommendations.

THE TROIKA

The functions of a University Medical Center are training, research, and service. These three need to be considered as an integrated package.

This new venture of the Outpatient Psychiatric Clinic provides an unparalleled training opportunity in community psychiatry for residents and (potentially) for many mental health disciplines. Andre contends that the duties of the resident EP can be viewed as an elaboration of the experience gained working with the "community" of inpatients. The same experiences of diagnosis, treatment, planning, organization, and decision-making as a team member are broadened and intensified. By mobilizing and coordinating forces, the resident learns that hospitalization can indeed be prevented.

A 53-year-old schizophrenic man, living alone, but hearing voices for the past four years came to the Outpatient Department. Previous contacts with two agencies resulted in identical recommendations — that he go voluntarily (or involuntarily) to a state hospital. By coordinating efforts of two agencies with his own efforts, the resident EP was able to provide medicine, outpatient therapy, and community support, and the man continues to work regularly and is improving.

THE RESIDENT DEVELOPS flexibility through shifting role functions, e.g., as therapist, consultant, and administrator. Training in decision-making and the exercise of authority with good judgment is given the resident EP through his experience and through his daily supervision by a member of the senior staff. There is ample exposure to enhance the *general* training of all residents, and, for some, it will stimulate interest in further subspecialization in community psychiatry.

Ideally, a psychiatric resident should be assigned to the emergency room during the day, then to be on immediate call after 5:00 p.m. He could be in his 2nd or 3rd training year, the rotation integrated into the regular three-year residency training program. Besides receiving training, he would teach the intern and several (Senior) medical students assigned to the emergency room.

The research potentials are enormous. Besides measuring what it is doing, a University Hospital Psychiatric Emergency Service could gather data re community needs, resources, and their utilization. Collection and interpretation of epidemiological data are fair game for a University Emergency Service serving the community. The origins and process of emerging (psychologic) illness, the role of crisis in ego development, and experimentation with new treatment techniques are only a few of the crucial issues to be examined. The mental health student (of whatever persuasion) should be involved in research effort as part of his basic training program.

By establishing closer and warmer relationships with the rest of the community, the University gains added community respect *and* self-respect. It, thereby, serves its students, faculty, and the people of the State well.

FINIS

By our own present definition of the treatment of a psychiatric emergency, the preliminary study done by Andre (as well as a more definitive study recently accomplished by Neal) suggest that we have been "successful" — people are getting *immediate* help.

Evidence is mounting that immediate help is real and that improvement in symptoms and functions is often maintained. Implicit in this paper is the hope that the ideal model described will be implemented and translated into a real model.

Adults tend to envy adolescents because adolescents have not *yet* wasted their opportunities. Let us not waste ours!

Editorial Note:

This article should point out to those in charge of Emergency Room Service the need and possible solutions to psychiatric problems. It is also worth noting in this modern day when forces on all sides suggest "total involvement" that psychiatrists are taking a look at the overall medical picture and are suggesting their own involvement in the acute care of patients.

Information for Contributors

1. Address scientific manuscripts to the Publication Committee, Michigan State Medical Society, 120 West Saginaw Street, East Lansing, Michigan.

2. Submit original, double-spaced typewritten copy and one carbon copy on letter size (8½ x 11 inch) paper.

3. On page one, include title, authors, degrees, academic titles, and any institutional or other credits.

4. Authors are responsible for all statements, methods, and conclusions. These may or may not be in harmony with the views of the Editorial Staff. It is hoped that authors may have as wide a latitude as space available and general policy will permit. The Publication Committee expressly reserves the right to alter or reject any manuscript, or any contribution, whether solicited or not.

5. Illustrations should be submitted in the form of glossy prints or original sketches from which cuts, or plates, will be made by MICHIGAN MEDICINE. MICHIGAN MEDICINE will pay the first $25 of the engraving bill, and the author shall pay the balance. An estimate of the cost will be submitted to authors before cuts are ordered.

6. References will ordinarily be limited to seven in number. Exceptions may occasionally be made.

7. Contributors will be notified as soon as practical if a manuscript is accepted for publication. Unused manuscripts will be returned. Every care will be taken with the submitted material but the Journal will not hold itself responsible for loss or damage to manuscripts.

8. Articles should ordinarily be less than four printed pages in length (3000 words).

9. References should conform to *Cumulative Index Medicus*, including, in order: Author, title, journal, volume number, page, and year. Book references should include editors, edition, publisher, and place of publication, as well.

10. Specify address to which galley proofs should be sent. Proofs will be mailed to authors for correction before publication and should be returned to the editor in 48 hours. If proofs approved by the author are not received by the editor prior to deadline, publication of the article will be cancelled for that issue.

11. The editors welcome, and will consider for publication, letters containing information of interest to Michigan physicians, or presenting constructive comment on current controversial issues. News items and notes are welcome.

12. It is understood that material is submitted for exclusive publication in MICHIGAN MEDICINE.

Medicine and the Law

ABSTRACT -- The divergencies in the philosophies and practical applications of medicine and law in their interrelation must be reconciled to obviate procedural and semantic differences in approach. The objectives, helping patient and client, are at one in motivation. Exchange education between the professions regarding the processes of each would be helpful. Practical aspects of the application of medicine and law are being sought through four major plans now operative. These are described and discussed.

BY MAX KARL NEWMAN, M.D.
DETROIT

PHILOSOPHIES OF LAW AND MEDICINE

The art of medicine and the philosophy of law must be intertwined, for 80 percent of all trial cases require medical proof.

Medicine has passed through three stages of development: diagnostic, preventive, and rehabilitative. Medicine's purposes are to maintain the patient in good health, to overcome disease and injury, and to lengthen his life span. Medicine evolves from the laboratory and clinical application by scientific process. Law's purposes have been peace and order and the pursuit of truth for justice, including the safeguarding of human rights and the concept of equality of opportunity. The two professions must serve the whole man. Their common goal is the pursuit of truth.

Justice Felix Frankfurter was rightly critical in saying: "Doctors and Lawyers follow their calling too narrowly; they live too exclusively within the professions; they do not cultivate enough intellectual detachment." The great need in both professions is not specialized practitioners but rather civilized practitioners to serve the common denominator — man.

People follow medicine; the law follows people. Patients accept new preventive, diagnostic, and therapeutic practices with reliance on and faith in their physicians. The community may refuse to accept new legal rules of conduct in the administration of justice; thus, new decisions for orderly progress of law may follow. Law undergirds its laws with the community mores, experiences, customs, and culture. This explains why people follow medicine but although they must be led by law, in the sense of the law's insuring stability, the law follows the demands of the culture of the people.

The philosophies showing the general relations between law and medicine have been classified as divisive factors by Mr. Oliver Schroeder, Professor of Law at Western Reserve University, Cleveland, Ohio. They are grouped under: (1) purposes, (2) relationship of patient and client, (3) semantics of medicine and law, (4) rate of advancement of law and medicine, (5) problem of how to bring the two professions together.

RELATION OF PATIENT TO PHYSICIAN OR CLIENT TO LAWYER

The physician serves the human being, primarily influenced by nature but always mindful of the health of the other members of the environment. The lawyer serves his client but the influence of the rights of other human beings must be preserved. The comparison shows more similarity of motive than differences of objective. Both professions serve the human being from a completely different approach, but both emphasize the integrity of the human being.

SEMANTICS IN MEDICINE AND LAW

A major divisive element between the physician and the lawyer is in semantics. This is because of the differences in emphasis, the separate professional terms of reference affecting meanings, and because of the differing responsibility of the professions to patient and client.

THE AUTHOR

Doctor Newman is associated with the department of physical medicine and rehabilitation, Detroit Memorial-South Macomb Hospitals.

Because medicine contributes to the administration of justice, it is necessary to understand the medical-legal terms. Such an understanding prevents the physician's conflict with the legal rules and statutes. Semantic reconcilement of terms of reference is mandatory. Terms have been appropriated to connote the application of medical knowledge to the administration of law and justice: "Forensic medicine," which originated in England; "legal medicine," which is of French origin; the "Gerichlichte Medezin" of the Germans, and "medical jurisprudence," an American term for the application of medical and surgical knowledge and skills to the principles and administration of law, comprising legal subjects having a medical aspect; thus, medical jurisprudence.

In general, it is necessary to have semantic understanding of medical-legal responsibility in relation to the four major groups involving the physician: (1) the medical organization, including State licensure, medical organization relations within medical societies, hospital management associated with staff functions and duties; (2) criminal law and its relation to forencis pathology and psychiatry and physiatry; (3) insurance in civil law in which the physician is most involved: personal injury (mostly in automobile accidents) and workmen's compensation and third party actions (usually associated with public building accidents) ; or malpractice in its many manifestations; (4) public health and industrial medicine, including pure food and drug activities, social security laws, and functioning of federal agencies under general tort laws.

Physicians consider that certain factors may produce illness even when the influence of those factors is only minimal. Those factors, whether etiologic, predisposing, or precipitating, must all be handled medically regardless of which is actually causative. Law requires only that 51 per cent probability of casual factors be present for legal responsibility. Hence a charge by a judge to a jury would be: "If you find the preponderance of evidence, which means the greater weight of evidence, that the plantiff's physical condition was caused by the accident, you should find for the plaintiff." When the same words and the same concepts have different meanings, they do tend to separate people and professions, causing discord. Dr. Keith Simpson, eminent physician and legal counsel expert in England, has indicated that one rarely hears the supporting tactics: "That is not what I mean; what I was asking you, Doctor, was . . . " Dr. Simpson cites the only exception to this in the expert's testimony: "If counsel deliberately misphrases a reply in order to mold evidence to his case, he must be corrected. He will accept the rebuff with a wry smile."

Regarding the judge in relation to hypotheses, one might ask how the judge can permit the attorney to put so-called facts, which are really assumptions, to a witness to clarify a situation: "Just assume, Doctor, that swallowing of 7 grains of sodium arsenite did not have an effect," and then, if not stopped, the counsel could continue his hoodwinking. One should refuse to entertain such opinions unless ordered to do so by the Judge.

RATE OF ADVANCEMENT OF MEDICINE AND LAW

Physicians and scientists are accustomed to rapid progress in resolved areas of endeavor. They have difficulty in understanding the slow progress of practical law. Although break-throughs in basic research have been historically slow, they are not so slow as they were before the last half century. When a breakthrough has been experimentally valid, clinical application is rapid. The lawyer cannot always appreciate the increasingly rapid change in scientific concepts; hence, in cross examination, he may fail to understand why a physician's conclusion may have changed drastically from year-to-year during a protracted case.

HOW CAN THE TWO PROFESSIONS BE BROUGHT TOGETHER?

The physician and the lawyer, medicine and the law, must be pivotally, not tangentially, oriented. This can be done. As a result of interaction between the American Medical Association and the American Bar Association, functioning has become reciprocally helpful at the levels of the State Medical Society, the County Medical Society, and hospital groups.

The physician must cross over to the side of the law by accepting the responsibility of being a medical witness in court who provides truthful facts and admissible opinions to aid in the administration of justice. The lawyer must cross to the medical side to aid in the preventive, diagnostic, and therapeutic tasks of medicine. This means that the lawyer and the physician must attempt to resolve legal conflicts speedily, in order to prevent iatrogenic complications, and to get the best medical recovery of the patient and the best legal disposition for the patient. In workmen's compensation accidents, a fixed disorder may be precipitated on a non-organic basis — an iatrogenic disease. The concept of participation must be furthered by: (1) education at schools of medicine and law to permit students to gain a thoroughly understanding concept of the processes at work on each side; (2) professional societies where intermingling and exchange of information may improve cooperation; (3) instruction and research through publications, as is now being done also in the state journals of medicine and law in order to insure the exchange of information between the professions.

PRACTICAL ASPECTS OF THE APPLICATION OF MEDICINE AND LAW: OPERATIVE PLANS

At times physicians have accused attorneys of promoting malpractice claims when an attorney attempted to secure expert advice in testimony in problems related to personal injury or malpractice. In turn, at times attorneys have accused physicians of a "conspiracy of silence." Judges on their part have retaliated in some areas with the concept of the *res ipsa loquitur* doctrine in order to permit the plaintiff's attorney to bring a case to trial. As personal injury suits increased and the need for expert medical testimony increased, physicians often have been averse to appearing in court. The physician is placed in an atmosphere entirely foreign to his training. He is accustomed to presenting his information according to accepted scientific procedures, basing his conclusions on observation of medical data studied. He is accustomed to the privilege of speculative interpretation from all points of view, all possible alternatives, without dogmatism. In the legal adversary system, the replies of the physician to a series of questions in court must be dogmatically in the affirmative or in the negative, unequivocally and without qualification — an unthinkable position to take in medical reporting. Thus an experienced trial attorney, if he chooses, is able to modify, to distort the actual medically factual account. If the medical expert uses the word **opinion,** counsel may suggest that the reply is **guesswork.** The medical **view** becomes to counsel by **conjecture;** medical use of **belief,** counsel may dismiss as **theory;** if the physician is **convinced,** the counsel calls it prejudice; a suggestion of **cooperation,** becomes at least a hint of **collusion.** What the expert considers **logical,** counsel may concede is **plausible,** or what seems medically **self-evident,** is disparaged as **glib.** An accepted **current view** in medicine is denigrated as present-day **theory.**

Both personal injury and malpractice may represent negligence to the legal mind. It should be a responsibility of the physician in furnishing the expert information to define and differentiate, and it should be the responsibility of the legal procedure to allow latitude for such clarification. This would obviate the concept of the so-called **impartial medical witness.**

Several plans are in operation to further understanding between physician and attorney. These are outlined under four media of consideration: (1) Medical Review Committee; (2) Joint Physician and Attorney Review Panel; (3) Expert Witness and Advisory Panel (California Plan); (4) American College of Legal Medicine.

1. The MEDICAL REVIEW COMMITTEE is the usual constituted type of organization made up of physicians in a local medical society. This committee reviews the case and recommends either for defense or settlement. When the recommendation is for defense, help is given to the physician to organize the defense.

2. The JOINT ATTORNEY-PHYSICIAN REVIEW PANEL is operatively mainly in Arizona and is known as the PIMA plan. The local Bar and Medical Societies have joined hands professionally. The panel is made up of nine physicians and nine lawyers; the defendant and his attorney, and the plantiff and his attorney participate. When a claim of negligence or malpractice is advanced, the chairman of the local joint group is notified, and he sets a date for a pre-trial hearing before the joint panel. The claimant may present his case, and may include hospital records; the defense may give his version; witnesses may be heard on both sides. The panel considers the evidence, and considers whether the evidence of serious injury arising out of malpractice is or is not substantial. If the answer is in the affirmative, an attempt is made toward an equitable claim adjustment; if this cannot be achieved, the medical soci-

ety produces the needed expert during trial. If the answer is in the negative, the plaintiff attorney is not to post or file a suit. The records of the panel are confidential and official records are not kept. This plan is also functioning in Idaho, New Mexico, New York, Nevada, Pennsylvania, and Virginia. It has been operative for 10 years.

In the functioning of this plan the potential of litigation is in the hands of the plantiff attorney and plaintiff as is evidenced by exposure of all records to the plantiff attorney at an early stage, which may give him an undue advantage. If the lawyer agrees not to represent the client, the client is still free to go to another attorney, utilizing the confidential material divulged at the panel hearing. In small communities, because the professional and social relations are close, the Joint Attorney-Physician Review Panel works well.

3. The EXPERT WITNESS AND ADVISORY PANEL is generally known as The California Plan. It is operative in a number of communities through the State of California. It also is being used in the State of Utah, where variations for using witnesses in malpractice cases are under community consideration.

In the California Plan, County Medical Societies furnish a panel of expert witnesses to the plantiff attorney. Precedents for this are in Los Angeles, San Diego, and San Francisco. The panel of physicians is drawn from the different specialties. The individual physician reviews all the records, examines the patient, and forwards a written report to the attorney. Should the attorney be dissatisfied with the method of the physician, he has the right to petition for another physician who then would be assigned to him. The responsibility of the physician is to testify if a case goes to court. This is obligatory. During the process of testifying, he must not make reference to the panel or to the combined Bar and Medical Societies' participation. The physician is paid a reasonable fee for consultation, examination, review of records, reports, and his function as an expert witness.

This plan has a divisive effect on the medical profession. Moreover, it does nothing for the defendant physician. Further, it fails to eliminate the nuisance suit.

4. PLAN OF AMERICAN COLLEGE OF LEGAL MEDICINE. All members of the American College of Legal Medicine are graduates of law schools as well as being practicing physicians.

PRINCIPLES:

A. Elevate standards of legal medicine and sponsor medical-legal research in order to reduce baseless suits.

B. Offer services as disinterested third parties to attorneys, in evaluating the malpractice problem

(1) Learn clinical facts and apply them to existing law.

(2) Neither to seek excuses for the physician nor to build a case for the patient.

(3) Show that there is no conspiracy of silence, a charge arising from a large number of baseless suits, so that a natural reluctance for physicians to testify resulted.

These principles reflect the uncivilized history of the resolution of complaints of malpractice.

PROCEDURE:

A. Assign case histories to members in rotation, each to examine material and send to appropriate medical experts and legal experts. Materials are sent to patient's attorney and to his physician.

(1) The committee gives an opinion regarding whether prosecution of the lawsuit will be successful. The presumption is that the average lawyer will not sue.

(2) Insurance companies will be likelier to settle dubious claims; hence, benefit the physician. Also, the insurance company would be advised to settle the claim when justified.

(3) If the claim is just, the opinion being unbiased, the physician is more inclined to insist on an out-of-court settlement.

B. Anonymity: Participants' names in the American College of Legal Medicine are not available. Names of parties to the suit are not available.

Medical-legal Dissection

Functioning in the fashion described, the American College of Medicine intends to remove baseless suits, on the one hand, and afford justice to the injured on the other hand. This concept tends to remove some of the existing threats to good medical care.

The American College of Legal Medicine Plan does not eliminate problems of "products liability." The newer legal concept is to include the physicians because some pharmaceutical companies may be using "stuffings" to escape liability. The plan does not eliminate malpractice suits in which medical experts are not needed, such as in assault and battery, breach of warranty, or consent and abandonment.

SUMMARY AND CONCLUSIONS

What works in one community may not work in another. Plans to further understanding between the professions and to eliminate nuisance lawsuits now operative are: The Medical Review Committee; The Joint Attorney-Physician Review Panel; The Expert Witness and Advisory Panel (The California Plan) ; The Plan of the American College of Legal Medicine. These plans are described and their limitations indicated.

Responsibilities of orientation through the press and films sometimes boomerang through misinterpretation. The client may insist on claims. The patient's feeling of having been wronged may have nothing to do with medical procedure, as in technically open areas, such as assault and battery, breach of warranty, criminal procedures against the physician, consent areas not requiring a medical expert.

Participation between the professions would be facilitated by education at professional schools regarding the processes of each profession, by intermingling of legal and medical societies for exchange of information, and by publishing in each other's journals.

Medicine must be looked to to provide medical truths and truthful opinions to settle or adjudicate legal conflicts. Law must cross over to the side of medicine to aid in the physician's preventive, diagnostic and therapeutic tasks. This can mean resolving legal conflicts speedily, thereby permitting the best medical recovery of the patient-client. Semantic reconcilement of disparate terms would reduce professional divisiveness. Medicine should have the legal privilege during testimony of scientific qualification of procedurally imposed dogmatic "yes or no" responses.

Editorial Note:

At the present time all physicians in Michigan are cognizant of the costs of Malpractice Insurance and the reason for such costs. We must find some solution to the problem of malpractice suits.

—John W. Moses, M.D., Scientific Editor

Non-Diabetic Glycosuria

(Note: This is one of a series of brief comments concerning problems seen in patients with Diabetes Mellitus. Members of the Clinical Society of the Michigan Diabetes Association will be supplying this material at frequent intervals. Readers of this Journal who care for diabetic patients will benefit by looking for these presentations of clinical importance and usefulness.)

BY WALTER ANDERSON, M.D.
DETROIT

We usually mean renal glycosuria when a patient has glycosuria with a normal blood sugar and a normal glucose tolerance test. Often the criteria also includes glycosuria in the fasting urine. This condition may be familial due to a defect in the renal tubular absorption of glucose. Some authors have reported, in long-term follow-up studies, that as high as 63% of patients with non-diabetic glycosuria may develop diabetes. Therefore, this group should be tested frequently for diabetes.

Acquired renal glycosuria may be seen in pregnancy; from 10 to 25% of such patients have been reported to have a non-diabetic glycosuria due to an increase in glomeruler filtration or a decrease in tubular reabsorption of glucose.

During the use of glucocorticoids, glycosuria may be found. Glycosuria also may be present in association with certain central nervous system disease, nephrosis, myocardial infarction, hyperthyroidism, disease of the liver and post-gastrectomy states. A glucose tolerance test is always necessary to rule out diabetes in these cases.

Other sugars, as fructose, galactose, lactose, pentose, and mannoheptulose may appear in the urine and give a positive test for sugar with one of the copper-reducing reactions (clinitest, Benedict's). Therefore, one of the glucose oxidase reactive tests (clinistix or tes-tape) should be used to specifically indicate the presence of glucose.

Too often a patient with a positive urine test will be advised to have only a fasting blood sugar. Frequently this will be normal and the patient assured he does not have diabetes. This is well illustrated by the following case:

A 59-YEAR-OLD WHITE male was found to have glycosuria and had a glucose tolerance test. He was told this was normal and he had renal glycosuria and not diabetes. During the following 25 years sugar was found in his urine on at least five occasions. He had five fasting blood sugars and was told that they were normal, always then being reassured that he had renal glycosuria.

These fasting blood sugars were 120, 128, 120 and 116 mg. per 100 ml. One 2-hour postprandial sugar was 157 mg. per 100 ml.

This patient was seen on November 12, 1967 with a typical history of claudication of right leg after walking one block. Physical examination showed a well-developed, well-nourished white male; height 6 ft., weight 190 pounds, stripped. Examination was essentially negative except for the lower extremities where both feet were cold to palpation; there was marked pallor of the right foot on elevation. Popliteal and dorsalis pedal pulses were absent bilaterally while the right posterior tibial pulse was absent and the left one diminished.

Oscillometer readings: Right ankle, zero; right calf ½ unit; left ankle, zero; left calf, 2 units.

The fasting blood sugar was 118 mg. per 100 ml. (true glucose). Urine was negative for sugar. A three-hour glucose tolerance test after a high carbohydrate diet for three days revealed:

	Blood*	Urine**
Fasting	122	Negative
½-hour	194	trace
1-hour	256	4-plus
2-hours	242	4-plus
3-hours	238	4-plus

*mg. per 100 ml.; **qualitative glucosuria

The blood urea nitrogen (BUN) was 12 mg. per 100 ml. and the cholesterol was 262 mg. per 100 ml.

This patient was put on a diabetic diet of: Protein 90 grams, Fat 70 grams, Carbohydrate 160 grams, totalling 1630 calories. 15 units of NPH and 15 units of regular insulin was given before breakfast each morning. On discharge a 2-hour postprandial blood sugar was 100 mg. per 100 ml.

DIABETES IS THE most common cause of glycosuria; therefore, any patient with glycosuria should have a glucose tolerance test. Even a 2-hour postprandial blood sugar may not be adequate, for in early diabetes this may be normal. A diagnosis of renal glycosuria should not be made unless it fulfills the diagnostic criteria of glycosuria in a fasting specimen with a normal blood sugar and a normal glucose tolerance test.

We must also remember that about 60% of the cases of glycosuria will eventually have a diabetic-type glucose tolerance test if followed over a number of years.

The Author, Doctor Anderson is an attending physician at Harper Hospital, Detroit.

Are You Participating, Too, In Search for Solutions?

BY JAMES B. BLODGETT, M.D.,
SPEAKER, MSMS HOUSE OF DELEGATES

The following comments might be the personal code for every physician — but how often are they?

> *"If I am not willing to participate in the search for the solutions to the problems of the times then I have relinquished this privilege to others who are willing to become involved.*
>
> *"If I am not pleased with their solutions to the problems I shall have no recourse nor any right to criticize."*

How often have you heard a physician voice those views rather than gripe and complain?

How often have you heard a physician make this kind of statement?

> *"If my children grow up and find this society an undesirable world in which to live they will ask me what did I do to protect it and to improve it for them and I must be able to answer, 'I did the very best I could.'"*
>
> *"I believe that we must be involved in the action and passion of our times or we shall run the risk of being judged not to have lived."*

The above comments were made at least by one Michigan physician . . . Jack M. Stack, M.D., of Alma. We refer to them here not only to pay tribute to Doctor Stack but to help set some high standards for all MSMS members.

These comments were offered humbly by Doctor Stack when he received the coveted Michigan Jaycee "Outstanding Young Man of the Year Award." Five such awards are given each year on a statewide basis and Doctor Stack is the only doctor of medicine so honored.

Doctor Stack, in receiving the award, pointed out:

> *"Many of our cynical friends question the validity of contributing a large segment of one's energies to community service, to partisan politics, and to professional organizational responsibility."*

As expected, Doctor Stack viewed the award as a new challenge:

> *"In my mind I shall consider this award to signify more than recognition of past accomplishments."*
>
> *"This award will parallel those other events in demanding of me increased participation, in offering new challenge and in exacting greater responsibility."*

On behalf of all MSMS members, I want to offer hearty congratulations to Doctor Stack who is serving now as president of his Gratiot, Isabella, Clare County Medical Society, as an alternate delegate to the MSMS House of Delegates, as vice president of the Alma Chamber of Commerce, as a member of the MDPAC Board of Directors and a finance chairman for the 10th Congressional District of the Michigan Republican Party.

Let's Boost MSMAS

BY G. E. MILLARD, M.D., CHAIRMAN,
MSMS ADVISORY COMMITTEE TO MSMAS

"Progress through Professionalism" will be the theme for the 1968 convention of the American Association of Medical Assistants with several Michigan ladies playing prominent roles.

More Michigan medical assistants will be able this year to make the short trip to the AAMA meeting in Columbus, Ohio October 9-12. All who attend the combination business-educational convention will benefit. Their physician-employers too will benefit as the medical assistants increase and improve their knowledge and insights.

The AAMA House of Delegates again will consider proposals for expanded programs. Michigan will be proud to have Betty Lou Wiley, of Port Huron, a past president of the Michigan State Society of Medical Assistants, preside as Speaker of the AAMA House of Delegates.

The AMA House of Delegates in San Francisco again praised the AAMA, noting that the group has grown to 12,000 members in less than 10 years. The AMA resolution, in part, urged every physician "to become fully acquainted with the objectives and programs of the AAMA, and to encourage his own assistants to seek membership in the national association and its local and state affiliates, and to participate in their education and certificate programs."

Physicians should stimulate membership and participation in the MSMAS and its local units in Michigan because the organization helps train the assistants and helps develop effective allies in many MSMS efforts in legislation, communications and medical education.

Many articles and photos about the MSMS House of Delegates and Annual Session will appear in the October News Extra and the November issue of Michigan Medicine.

See Page 1243 about "Outstanding Physician of the Year Award" to Marjorie Peebles Meyers, M.D., of Detroit.

MAGP Symposium On Immunization Set Oct. 6 at MSU

About 350 physicians are expected to attend the Symposium on Immunization sponsored by the Michigan Academy of General Practice Sunday, October 6, at the Kellogg Center in East Lansing.

After lunch Andrew D. Hunt, Jr., M.D., Dean of the Michigan State University College of Human Medicine, will speak on "How to Graduate More Family Physicians."

The program is acceptable for 6 prescribed hours by the American Academy of General Practice.

Physician's registration fee, including lunch, is $10.

MSMS-MHC to Sponsor Careers Workshop Oct. 23

Officials from many Michigan universities and health associations have accepted invitations to speak at the Health Manpower Conference, October 23 near Battle Creek.

The Michigan State Medical Society and the Michigan Health Council, joint conference sponsors, have invited representatives of county medical societies, hospital board members, hospital administrators, school counselors, community college officials, county supervisors, nurses and other interested in health manpower.

The program, which will run from 9 a.m. through dinner, will be held at the Michigan Education Association Conference Center on St. Mary's Lake.

Robert E. Rice, M.D., Greenville, Chairman of MSMS Committee on Rural Medical Service, will preside as chairman.

Copies of the complete program are available by writing MSMS, 120 W. Saginaw, E. Lansing 48823.

Among the many speakers will be Milford O. Rouse, M.D., Texas, past president of the AMA; Lionel F. Swan, M.D., Detroit, president of the National Medical Foundation; Charles Skinner, Jackson, president-elect, Michigan Hospital Association.

Also, William H. Knisely, Ph.D., East Lansing, member, National Advisory Council on Education for Health Professions; Robert Kinsinger Ed.D., program director, W. K. Kellogg Foundation. MSMS and MHC officials will participate.

Smoking-Health Speakers Set For Oct. 20

Topics ranging from smoking-related diseases to steps that may help smokers break the habit will be covered at the Physicians' Symposium on Smoking and Related Diseases Sunday, October 20, at MSU's Kellogg Center in East Lansing.

The session, designed especially for general practitioners, will include discussions of Vascular Diseases, Respiratory Diseases, Cancer of the Lung and Smoking Cessation Methods.

It will open with a welcome address by Lee Feldkamp, M.D., president of the Michigan Academy of General Practice, and remarks by George Pickett, M.D., deputy director of the Wayne County Health Department and former assistant director of the National Clearinghouse on Smoking and Health.

Speakers at the morning session are Vernon Wendt, M.D., of Grand Rapids, who will discuss "Cardiac Complications," and E. Osborn Coates, Jr., M.D., of Detroit, speaking on "Respiratory Diseases."

An afternoon session on lung cancer will include: "X-ray Diagnosis of Lung Cancer," Charles O. Long, M.D., Lansing; "Clinical and Surgical Evaluation," Cameron Haight, M.D., Ann Arbor; and "Pathology of Lung Cancer," R. Abell Murray, M.D., Ph.D., Ann Arbor.

Alfred Soffer, M.D., editor-in-chief of *Diseases of the Chest* will discuss "National Approaches to Smoking Cessation and What the Office Practitioner Can Do," and Arthur Weaver, M.D., Detroit, will outline methods of smoking cessation.

Roundtable discussions will follow both the morning and afternoon programs.

Sponsors of the symposium include Michigan Academy of General Practice, Michigan Council on Smoking and Health, Michigan Health Council and MSU's College of Human Medicine, and other health-related organizations.

Battle Creek Clinic Day Program Set

A Western Reserve University surgeon will describe medical problems that exist in remote sections of Australia and New Guinea when he delivers the feature lecture at the annual Southwestern Michigan Clinic Day Thursday, November 7, in Battle Creek.

Brown M. Dobyns, M.D., professor of surgery at Western Reserve, will deliver the annual Russell L. Mustard Memorial Lecture to conclude the day-long event at the Battle Creek Country Club.

The lecture is sponsored by the Calhoun County Medical Society.

The Clinic Day, which begins at 9 a.m., will be devoted to a Symposium on Cancer Therapy, sponsored by Lederle Laboratories.

Speakers and their topics include: Edward G. Krementz, M.D., of New Orleans, "Advances in the Diagnosis and Treatment of Melanoma;" David M. Sklaroff, M.D., of Philadelphia, "Recent Advances in Radiation Therapy;" Richard A. Oberfeld, M.D., of Boston, "Prolonged Intra-arterial Infusion Cancer Chemotherapy for Advanced Cancer;" and Charlotte T. C. Tan, M.D., of New York City, "Solid Tumors in Children."

Following the lectures will be round table discussions involving the four speakers, with ample time for questions and comments, according to Robert W. Brown, M.D., chairman of the Clinic Day committee. Also scheduled is a noon luncheon.

Interested MSMS members in Southwestern Michigan are invited. Programs are available from Robert W. Brown, M.D., 231 North Avenue, Battle Creek 49017.

HEW Issues New Report on RMPs

The following box-score has just been released by the U.S. Department of Health, Education and Welfare to give the current status of the Regional Medical Programs to implement the federal heart-stroke-cancer legislation:

Twenty-three Regions are now operational. They include the 10 most recently funded operational Programs which are . . .

California
Central New York
Georgia
Iowa
Maine
Memphis
Michigan
New Mexico
South Carolina
Texas

One new planning grant has been awarded to the Puerto Rico Regional Medical Program.

Applications from a total of 11 Programs to become operational are in the review process.

Continuing and supplemental planning and operational grants have been made and others are under review.

Bronson Clinic Coming Oct. 16

Physicians in Southwestern Michigan are invited to attend a conference devoted to "Current Concepts of Renal Disease" Wednesday, October 16, in Kalamazoo.

It will be the ninth annual Clinical Conference at Bronson Methodist Hospital. Registration is at 8 a.m.

Speakers will include John P. Merrill, M.D., of Boston; Charles V. Pryles, M.D., of Brooklyn; Thomas F. Meaney, M.D., Cleveland; and Conrad L. Pirani, M.D., Chicago.

MSU Adds Research Scientist from NIAID

Norman B. McCullough, M.D., research scientist with the National Institute of Allergy and Infectious Diseases, recently joined the MSU College of Human Medicine as professor of microbiology and public health and professor of medicine.

Doctor McCullough, who spent the past 10 years as chief of the Laboratory of Bacterial Diseases, is known internationally for his studies in Brucella.

Manpower Act Signed, Extends Only Two Years

Physicians related to the three Michigan Medical Schools are especially interested in the details of several bills signed into law by the President.

President Johnson signed into law the Health Manpower Act of 1968 which extends for two years, until June 30, 1971, and expands the federal programs of aid to medical and allied health schools.

President Johnson termed the health manpower law "a major measure in the battle for better health." It authorizes about $1.2 billion in federal aid to medical and other health personnel schools over two years for construction, expansion and operating expenses. Congress followed most of the Administration's proposals in approving the legislation but limited the extension to two years, instead of the four years requested.

Schools of pharmacy and veterinary medicine were made eligible for the first time.

Money authorizations for schools in the new law includes:

Medical and other health professions — construction grants, $395 million; institutional support, $285 million; scholarships, $32.8 million; student loans, $70 million; total, $782.8 million.

Southwestern Michigan Study Indicates Need for 25 Per Cent More Doctors

Michigan should have 25 per cent more doctors just to meet present needs, a study by the Michigan Health Council indicates.

Preliminary results of a medical manpower study in 14 Southwestern Michigan counties show the counties a need of an additional 268 physicians if they are to meet current demands for medical services.

"The need for nearly 25 per cent more medical doctors comes as no surprise to the Michigan Health Council," comments John A. Doherty, MHC executive director.

"Nearly every day we receive calls from doctors and other health leaders asking for help in obtaining additional doctors for their communities. Some doctors are becoming desperate about their situations. Some medical doctors with many years of specialized training in surgery and other medical specialties are having to go back to general practice because of the acute shortage of family physicians."

Physicians and hospital administrators who took part in the study estimated a need for 89 additional general practitioners and 179 medical specialists. They reported opportunities for 36 trained in internal medicine, 25 pediatricians, 22 psychiatrists, 18 obstetrician-gynecologists, and 11 general surgeons.

There are currently 1,122 paysicians within the 14-county area, 410 general practitioners and 712 specialists, serving a population of approximately 1.32 million, reports Mr. Doherty.

More than 95 per cent of the doctors interviewed believe the shortage of physicians would be helped immeasurably by expanding the two-year College of Human Medicine at Michigan State University to a full four-year, degree-granting institution. They also felt that medical schools at Wayne State University and the University of Michigan should be expanded.

Students currently enrolled in medical schools should be encouraged to pursue careers in family or clinical medicine, the survey participants said.

If the Southwestern Michigan survey requests, Mr. Doherty said, are projected for all of Michigan, the state would need upwards of 2,500 more practicing physicians. This alarming figure is much worse than a 1966 estimate by the Michigan Health Council which predicted the state was some 600 doctors short of meeting present medical needs of its citizens. An expanding population will probably make the future patient-to-doctor ratio even worse than the present 820-to-1, Doherty predicts.

The study was conducted with a grant from the Michigan Foundation for Medical and Health Education in the counties of Allegan, Barry, Berrien, Branch, Calhoun, Cass, Eaton, Hillsdale, Ingham, Jackson, Kalamazoo, Lenawee, St. Joseph and Van Buren.

Two Bond Issues On Fall Ballot For Recreation

BY ELMER WHITE
EXECUTIVE DIRECTOR
MICHIGAN PRESS ASSOC.

Michigan voters on November 5 will be asked to support the "Michigan Quality Recreation Proposal."

There will be two proposals, not dependent upon each other. One will be a $100 million recreation proposal and the other a $335 million water pollution control proposal. If authorized by voters, the state will bond itself for the $435 million.

PROPONENTS STRESS that the bonds can be sold with no increase in taxes. Retirement of other bond issues and economic growth will provide enough revenue to cover principal and interest payments within the present tax structure.

The $30 million earmarked for local recreation facilities would be available to communities on a matching basis with the state paying 75 percent of costs. The remaining $70 million would be spent for state parks, fishing areas, fish hatcheries, forest campgrounds, hunting areas, hiking trails, snowmobile trails, etc. Combined with local and federal funds, and estimated $170 million will be available for recreational purposes.

CLEAN-WATER PROPOSAL, if approved by voters, will help finance new sewage treatment plants, improvements to existing plants, and loans for new sewers. Some 150 communities are currently in violation of Michigan's pollution control law. These communities would qualify for 50 percent assistance from the state and 25 percent from the federal government in instituting a pollution control program.

About $50 million would be earmarked for sewer construction and $285 million for treatment plant construction and improvement. The addition of federal and local funds would provide more than $600 million to clean up Michigan's lakes and streams.

Now Is the Time For All Good Men

BY VERNON V. BASS, M.D.
CHAIRMAN, MDPAC

All of us know that government is deeply involved in planning, producing, and financing health care.

Approximately 2,000 bills of interest to medicine were introduced in the U.S. Congress this year, as were over 150 health bills in the Michigan Legislature.

The responsibility for endorsing, financing and helping to elect wise, dependable political candidates who will listen to the views of the medical profession before voting, rests primarily upon MDPAC and AMPAC.

Your state MDPAC committee has carefully assessed the voting records of all legislators and by election day, November 5, will have supported over 50 candidates for the Legislature as well as several key Congressmen. There are several candidate support committees of doctors and their wives actively helping in vital congressional races.

MDPAC can only succeed in doing an effective job of campaigning in ratio to the amount of financial help it receives from doctors of medicine.

May I urge each of you to assume your political responsibility first by becoming a contributing member of MDPAC-AMPAC and secondly by your political participation to help us select, elect and retain the best men we can get in office both in Lansing and Washington!

If you are not already a member, please join today.

Doctors Permitted To Subscribe Only For Blue Cross

Michigan Blue Cross-Blue Shield has sent the following memo to physicians in the Blue coverage group:

Since the recent implementation of the Blue Shield MVF-2 program in the Michigan State Medical Society some doctors have requested that they be permitted to retain only their Blue Cross coverage and not purchase the Blue Shield program.

Those of you who choose to carry Blue Cross only may do so. Appropriate refund back to August 1, 1968, will be made.

The Blue Cross plans available are:

1. Comprehensive hospital, which provides 365 days of care with optional "special dependents" coverage (Riders S & F).
2. Deductible hospital coverage ($50 per adult member per hospital bed-patient admission) with 365 days of care with "special dependents" coverage (Riders S & F).
3. Those members 65 and older may elect Blue Cross "65" complementary coverage which is designed to fill the gaps in Medicare.

Members of the Society desirous of exercising the above options should make their request promptly and in writing to: Central Correspondence Department — Mail Code 60, Michigan Blue Cross and Blue Shield, 441 East Jefferson Avenue, Detroit, Michigan 48226.

Wide Variety Of Topics Set For AMA Meet

Scientific sessions of wide medical interest are planned for morning and afternoon Monday through Wednesday, December 2-4 at the 22nd AMA Clinical Convention in Miami Beach, Fla.

Topics December 2 include the anemias, thrombophlebitis, obstetrics, white cell disorders and diseases of the lymph nodes, management of claudication, cerebral ischemia due to neck vessel occlusion, and gynecology.

Subjects for December 3, are cardiology, gastrointestinal diseases, proctology, and — in the afternoon — new approaches in cardiology, bacterial skin infections, and the skin and sunlight.

Discussions on sex will be held December 4, to include such topics as marital problems, changing sex values, preadolescent and adolescent sex education, and sex and the senior citizen. Other topics December 4 will be hypertension, kidney, pulmonary diseases, and respiratory ills in children.

Scientific sessions will be held in Miami Beach Convention Hall. Total registration is expected to be about 10,000.

OFFER MICHIGAN REHAB DIRECTORY; WRITE TO MSMS

A directory listing the state's rehabilitation facilities and services for physically impaired persons is available to physicians in Michigan.

The "Directory of Michigan Medical Facilities for the Physically Impaired" was published by the MSMS Committee on Rehabilitation.

Interested MSMS members may obtain a copy by writing the MSMS, 120 W. Saginaw, East Lansing 48823.

Marjorie Peebles Meyers, M.D., Honored As "Outstanding Physician of the Year"

Marjorie H. Peebles Meyers, M.D., Detroit, presented her report to the MSMS House of Delegates, Sunday night, September 22 as chairman of the "Committee to Select MSMS Members for Certificates of Commendation."

The next report caught Doctor Meyers by surprise!

James B. Blodgett, M.D., Speaker of the House, called upon D. Bonta Hiscoe, M.D., Lansing, chairman of the "Committee to Select Michigan's Outstanding Physician of the Year."

Doctor Hiscoe reported that the Committee was recommending an outstanding practitioner, educator, medical statesman and civic leader — Marjorie Peebles Meyers, M.D.!

The Delegates adopted the report unanimously and the award was formally presented to Doctor Meyers at the Delegates Dinner, September 24.

* * *

DOCTOR MEYERS, ACCORDING to Doctor Hiscoe in his Committee report, was selected for many reasons:

— Doctor Meyers is a highly-respected Detroit internist,

— Doctor Meyers is regarded as an excellent Assistant Professor in the WSU Medical School,

— Doctor Meyers is an active member of the Wayne County Medical Society and MSMS,

— Doctor Meyers is one of the MSMS alternate delegates to the AMA House of Delegates,

— Doctor Meyers is a hard-working officer and member of several Michigan and Detroit health, welfare, educational, and cultural organizations,

— Doctor Meyers was selected recently as one of the "Top Ten Detroit Women Who Work,"

— Doctor Meyers, who is married to a minister, holds a responsible lay position in the Episcopal Church in Michigan.

DOCTOR MEYERS DECIDED TO become a physician at age 13. There was nothing traumatic about the decision. "It was a hot, summer's night," she recalls, "and my parents had invited guests over for the evening. One of them asked me what I wanted to be when I grew up and I replied, 'A doctor.' " Fifteen years later she received her medical degree from Wayne State University.

Her childhood was warm, secure and somewhat sheltered. She was an only-child and grew up in Harlem before it became "what it is now." Her father, a special clerk on foreign mail for the Post Office Department, made sure his daughter developed an early interest in education. "I remember his coming home from work, turning the radio on softly and reading to me from the *New York Times*," she said. "It wasn't long before he had me reading the newspaper to him. I learned Shakespeare before I could write."

Not only was young Marjorie exposed to the world of books, she was taught a philosophy of life. "I had no problem with identity or any fear that there would be things I couldn't do. I was taught that a person can do anything provided he has it on the ball."

Although she was aware she was Negro, her environment cushioned her from most discrimination. The neighborhood was integrated and closely allied. People were friendly and took an active interest in the neighborhood youngsters.

Even when she entered Hunter College in New York, her close circle of friends buffered Marjorie from the racism of the outside world. "We were a motley crew," Doctor Meyers says of her schoolmates. "There were six of us who had gone through high school together and enrolled at Hunter. One was French, two were Irish, one was a German and one a Jew. I'm Episcopalian. We

The delegates applauded long and voiced enthusiastic approval for the selection of Doctor Meyers as the "Physician of the Year."

Doctor Meyers expresses her grateful thanks to the House of Delegates for the high honor.

stuck pretty close together. One day an English teacher asked one of the girls, 'Is Marjorie a Negro?' My girl friend replied, 'Gee, I don't know!' "

The light-skinned young lady suspected discrimination when she applied to Columbia Medical School in 1939. She had just completed her Master's program at Columbia. She was told that enrollment in the fall class "was impossible," enrollment the following year, "might be," but that enrollment three years hence, "was assured." She felt Columbia didn't really want her — not because she was Negro but because she was a woman.

DOCTOR MEYERS MARRIED the Rev. Frederick R. Meyers in 1939. He was a vicar in a New York church and the couple met through church work. Shortly after they were married, the Reverend Meyers accepted a call at St. Mathews in Detroit. His wife promptly made application to WSU Medical School. Reverend Meyers now serves as a Canon for the Cathedral Church of St. Paul in Detroit.

It was after admittance to WSU that Doctor Meyers felt the bite of discrimination.

"There were five or six women in our class. One day I noticed, through the mail box windows, white envelopes for all the girls except me. They looked like invitations.

"Without thinking I asked, 'What are all those white things you girls are getting?' The girl I asked looked uneasy, then drew me aside. She had tears in her eyes and told me they were invitations to pledge a sorority, and said, 'Oh Margie, you've been blackballed!' "

"I felt rather uncomfortable at the moment, but it was later that the reaction set in. I became so upset I flunked an exam. The more I thought about it the worse I felt, especially since a medical sorority is supposed to be composed of the cream of the crop. I finally became utterly and extremely ill. I didn't even mention it to my husband for days."

* * *

SHE RECEIVED her WSU medical degree in 1943, and served her internship and residency at Receiving Hospital, Detroit. The late Gordon B. Myers, M.D., former Chief of Medicine at WSU, influenced the young doctor's decision to specialize in internal medicine and serve her internship at Receiving.

Doctor Meyers believes strongly in a one-to-one doctor-patient relationship. "One reason I didn't specialize in Pediatrics is because you have a one-to-three relationship;" she says, "the child and his two parents. I like children, but I'm scared to death of sick children. That's another reason," she quipped.

She and her colleague, Eugene M. Shafarman, M.D., share facilities on the 11th floor of the Professional Plaza in the Detroit Medical Center, a half-block from Harper Hospital.

WITH A SLIGHT TRACE of Eastern accent remaining, Doctor Meyers is outspoken in her concern for a better public relations program for the medical profession, and especially for the American Medical Association. She points out that the profession is undergoing many changes, making many advancements, but that the public is usually not informed or ill-informed. "We never seem willing to admit that we can be wrong or make a mistake," she says. As a result, the public becomes suspicious of many things which are accomplished.

Critical of AMA, Doctor Meyers feels the organization still harbors racial prejudice. "The Na-

Doctor Meyers receives warm congratulations of Brock E. Brush, M.D., chairman of MSMS public relations committee.

tional Medical Association was organized because of the bias in the AMA towards Negro physicians," she charges. "And at the recent meeting in Houston, the AMA didn't even have the courtesy to send a representative.

"I'm a dues-paying member of the American Medical Association because I feel a person should not criticize something unless he also works to change conditions. I guess I'm doing both. And you can quote me on that," she added.

Doctor Meyers believes racial conditions are improving. "As recently as 18 years ago," she says, "there were certain beds designated at some hospitals for Negro patients. Negroes had to wait until a Negro bed was available before they would be admitted. This is no longer the case."

SHE ALSO BELIEVES that there is a severe shortage of Negro physicians, and that neither Negroes nor women are handicapped when pursuing a medical career.

"My advice to anyone who wants to become a doctor is always the same. If the person is a woman I ask, 'Do you plan to use your medical degree?' Women who plan to marry and raise families instead of practicing medicine should not try to become doctors. It's too expensive for both the student and the public which shares the cost.

"If the woman is going into medicine to work with people, she must be reasonably 'solid.' She can't be sensitive and think that people will do things for her simply because she is a woman. One's physical and emotional strength must be rated. But one of the most important requisites is a sense of humor. You must be able to laugh, especially at yourself.

"Finally, you don't look at the color of your skin if you want to be a physician. You look at what you have between your ears . . . and where you can get financing."

* * *

DOCTOR MEYERS IS a dedicated member and leader in many organizations. In addition to the groups named early in this article, Doctor Meyers is vice president of the Michigan United Fund, vice-president of the Detroit Urban League; active in the Neighborhood Service Organization which works with Detroit youngsters; treasurer of Detroit Adventure, a cultural group; a member of the Michigan Society for Mental Health; a board member of Boy's Republic; President-Elect of the Michigan Diabetes Association; a board member of the Michigan Heart Association; a board member of the Rehabilitation Institute; the first and only woman member of the Standing Committee for Advice and Counsel to the Bishop of the Diocese of Michigan of the Episcopal Church, a member of the Detroit Committee on Alcoholism, and a long-time worker for the Detroit YWCA program.

Horizons Unlimited

MSMS members may obtain copies of the AMA "Horizons Unlimited" career handbook with an eight-page Michigan insert by writing to MSMS, P.O. Box 152, East Lansing 48823.

U. S. POLIO CASES DROP OFF 99.9 PER CENT

Polio cases throughout the United States were down to 15 during the first seven months of 1967, virtually a 100 per cent drop in incidence since Salk vaccine was first used in 1955.

This represents the lowest national total on record, with only 10 states involved so far.

The Health Insurance Institute, citing United States Public Health Service reports, said 13 of the victims had contracted paralytic polio.

The peak year for the often-crippling disease was 1952, when 57,879 cases were reported. Since then, the Salk vaccine, and the Sabin vaccine, introduced in 1961, have all but eliminated the polio threat in this country. In 1955, 28,985 cases were reported.

AMA-NEA PARTNERSHIP

School health has been a particularly vital concern to the AMA since 1882, when it urged that hygiene be taught in schools. For 56 years the AMA has worked directly with the National Education Association to shape policies and practices in school health education and services.

COMING EVENTS

U-M Reunion Offers MSU Game, Oct. 11-12

One of the special highlights of the annual Medical Center Alumni Society Reunion at Ann Arbor October 11-12 will be the opportunity to cheer for the Wolverines on Saturday, October 12 against the rival Michigan State Spartans.

The two days of activities always include the football game, and 1968 offers the outstanding grid battle.

Special guests will be the 50-year graduates from the 1918 medical and nursing classes. Other alumni especially invited are those whose graduating year ends with a 3 or 8, such as 1923, 1928, 1933, etc.

Speakers will include Robben Fleming, U-M president; Dean of Medicine William N. Hubbard, Jr., M.D., and Dean of Nursing Rhoda R. Russell, R.N.

President of the Medical Center Alumni Society is John O. Goodsell, M.D., Saginaw.

MSMS, U-M PLAN SEMINAR DEC. 1 ON ADOLESCENTS

MSMS, through its Postgraduate Medical Education Committee, will co-sponsor with the University of Michigan Department of Postgraduate Medicine, the 1968 Winter Symposium on "Creativity, Conformity and Concepts of the 20th Century Adolescent," at the Sheraton Ann Arbor Motor Inn, Sunday, December 1. The Symposium will be financed by Geigy Pharmaceuticals, a Division of Geigy Chemical Corporation. Copies of the program may be obtained from the Department of Postgraduate Medicine at the U-M Medical Center.

MEDISCENE

Oct. 9 — Family Life Education Workshop, MSMS Headquarters, East Lansing
Oct. 11-12-13 — University of Michigan Medical Center Alumni Conference, Ann Arbor
Oct. 20-26 — National Community Health Week
Oct. 23-24 — Michigan Tuberculosis and Respiratory Disease Association Annual Meeting, Hayes Motor Hotel, Jackson
Oct. 24 — Michigan Thoracic Society Annual Meeting, Hayes Motor Hotel, Jackson
Oct. 30-31 — Symposium on Neuroendocrinology of Human Reproduction, McGregor Conference Center, Wayne State University
Nov. 6 — The Council, MSMS Headquarters, East Lansing
Nov. 10 — MSMAS Officers' Workshop, Port Huron Motor Inn, Port Huron
Nov. 11-15 — American Public Health Association Annual Conference, Cobo Hall, Detroit
Dec. 1-4 — AMA Clinical Convention, Miami Beach
Dec. 11-12-13 — 14th Annual In-Service Training Conference, on Chronic Illness, Division of Adult Health, Michigan Department of Public Health, Holiday Inn South, Lansing
Dec. 18 — The Council, MSMS Headquarters, East Lansing
May 21, 1969 — Annual Muscle Symposium — Wayne County Medical Auditorium, Detroit

WSU Reproduction Seminar, Oct. 30-31

Harper Hospital and the Wayne State University School of Medicine will sponsor a two-day symposium on the "Neuroendocrinology of Human Reproduction" October 30-31, in the WSU McGregor Center.

Specialists will offer biological and clinical perspectives on the physiology and pathology of reproduction. Program chairman is Harold C. Mack, M.D. For further information contact Symposium on Human Reproduction, Wayne State University, 100 West Kirby Avenue, Detroit 48202.

PONTIAC ART SHOW TO BENEFIT RESEARCH

The Research Foundation of the Pontiac Providence Hospital Medical Staff will present its 2nd Annual Art Exhibit at the Adeline Fisher Center, Friday, October 11, from 10:00 a.m. - 5:00 p.m., and Saturday and Sunday, October 12 and 13, from 10:00 a.m. - 10 p.m.

Included will be the work of well known and amateur Michigan artists, displaying oils, water colors and ceramics.

MHC Placement Services Helps Locate 850 Doctors In Michigan in 15 Years

In its 15th year of operation, the M.D. Placement Service of the Michigan Health Council has been responsible in part for the placement of more than 850 doctors of medicine in Michigan. In recent years placements have averaged approximately 55. In the period from July 1, 1967 to June 30, 1968, sixty-two M.D.s were placed.

All of the usual activities in the Placement Service which take place in the first six months of the year have been completed. These include revision of the rosters and a survey of all communities registered with the Service to bring the opportunities up to date. At the same time, all of the M.D.s registered have been contacted to determine if they still wish to receive placement information.

The list of communities needing doctors is ever increasing. More than 140 now are in need of at least one family physician, and over 60 communities are searching for medical specialists. Several communities in need of doctors have developed special brochures under the guidance of, or in cooperation with, the Michigan Health Council. These publications have been distributed to physicians registered with the Placement Service.

In cooperation with the Michigan Tourist Council, a full-page advertisement was placed in the Student AMA Journal, *New Physician*. Response was very good, and the ad was repeated in the publication. We also arranged to have the advertisement placed in *Physician's Management*, a publication that reaches family physicians throughout the United States. The magazine has run the advertisement on numerous occasions as a public service to doctors and to the Council. The ad also has been placed in all of the magazine's specialty publications. More than 300 replies have been received as a result of this national campaign. The first doctor to locate in Michigan as a result of this program is in general practice in Sturgis.

Consumers Power Company, because of its interest in the economic development of rural Michigan and its recognition of the need for an adequate number of doctors, has taken a keen interest in assisting the Michigan Health Council in promoting Michigan as a place to practice medicine. The Company developed an outstanding brochure that describes the vast opportunities for family doctors. Copies are available in quantity to Michigan physicians who are interested in sending the brochure to medical students, interns and residents along with a personal message inviting them to come to Michigan.

The Upjohn Company of Kalamazoo has continued its much appreciated financial support of the Council's Placement Service — which is rated by doctors using it as the most helpful in the Nation.

The Dentist Placement Service continues to grow, and the number of opportunities for dentists throughout the State has tripled in the past two or three years.

HEART, CANCER, STROKE NOW CLAIM 7 OUT OF 10

Heart disease, cancer, and stroke, taken together, claimed 1.2 million American lives in 1965 — about 7 out of every 10 deaths in this country.

Heart disease — or, more technically, the cardiovascular-renal diseases — can be divided into three major categories: (1) strokes — damage to the blood vessels affecting the central nervous system; (2) diseases of the heart and blood vessels serving the body, including rheumatic fever, arteriosclerosis, high blood pressure and hypertensive heart disease; and (3) kidney disease, including chronic nephritis and renal sclerosis. Heart disease and stroke accounted for over 900,000 deaths in 1965.

Uncontrolled cancer growths, which invade and destroy living tissue, occur in a variety of forms in many different body locations. In 1965, cancer caused nearly 300,000 deaths. Unless cancer rates are cut, about one out of every four people alive in the United States today can expect to develop cancer at some time.

ACTIVITIES, PROJECTS

Would Alert Public To Health Hazard Posed by Chiropractors

The AMA House of Delegates in San Francisco adopted a resolution which urged all state and county medical societies to alert the general public to the health hazard posed by the cult of chiropractic. The resolution pointed out that physicians have a direct and personal responsibility to provide the best scientific medical care and to protect the health of the public.

The resolution called attention to the AMA's statement of policy which notes in part that:

> *"It is the position of the medical profession that chiropractic is an unscientific cult whose practitioners lack the necessary training and background to diagnose and treat human disease. Chiropractic constitutes a hazard to rational health care in the United States because of the substandard and unscientific education of its practitioners and rigid adherence to an unscientific approach to disease causation.*
>
> *" . . . The delay of proper medical care caused by chiropractors and their opposition to the many scientific advances in modern medicine, such as life-saving vaccines, often ends with tragic results."*

The resolution urged state medical associations and component medical societies to adopt the AMA Policy Statement on Chiropractic, or a somewhat similar expression.

SMOKING-HEALTH POSTERS AVAILABLE FROM MSMS

Physicians interested in communicating an anti-smoking message to patients can consider displaying a striking poster which reads, "1,000 Doctors Have Quit Smoking Cigarettes (Maybe they know something you don't)."

Posters are available from MSMS Headquarters, P.O. Box 152, East Lansing.

Smoking Council Provides Program Guidance for PTAs

A new program planning guide, designed to help discourage smoking among children, is being distributed in September to the 2,200 local PTA units in Michigan.

The guide was developed by the Michigan Congress of Parents and Teachers in cooperation with the Michigan Council on Smoking and Health.

The suggestions are designed to help PTAs inform the parents of school-age children about the dangers of smoking and to discourage young people from starting to smoke.

The project also seeks to encourage parents to examine their smoking behavior and its possible influence on children, "the great imitators;" to urge parents' support of school programs dealing with smoking and health; and to urge parents to cooperate with local health organizations in solving the problem of smoking.

Mrs. Mary Palmer, of Parma, is health chairman for the Michigan Congress.

The Michigan Council on Smoking and Health consists of 16 member organizations, including the Michigan Congress and the Michigan State Medical Society.

State Physicians On AAP Program

Seven Michigan physicians will participate in the 37th annual meeting of the American Academy of Pediatrics, October 19-24 in Chicago.

Stuart M. Finch, M.D., of Ann Arbor, will serve as chairman of a general session panel, "Sex Education — The Parents' Role," Tuesday, October 22.

Participating in the Monday, October 21, scientific program of the Section on Surgery will be James R. Lloyd, M.D., of Detroit; and Edward S. Tank, M.D., George E. Bacon, M.D., and George H. Lowrey, M.D., all of Ann Arbor. Doctor Lloyd will conduct a session on Gastrointestinal Perforations in the Newborn: Etiology and Management, and the three Ann Arbor doctors will lead a discussion of Surgical Management of Thyrotoxicosis in Children.

Reuben Meyer, M.D., and Allan Done, M.D., both of Detroit, will participate in the annual meeting of the American Association of Poison Control Sessions during the Monday, October 21, session. Doctor Meyer will take part in a program on Dialysis for Toxins, and Doctor Done will participate in a session on Hallucinogenic Drugs.

The Academy's annual meeting includes general sessions, seminars, section meetings, special sessions, clinical conferences, a business meeting and technical exhibits. It will be held at the Palmer House in Chicago.

Pathologists Award Two $500 Fellowships

The trustees of the Michigan Society of Pathologists have approved the donation of two $500 junior college fellowships to Michigan students planning careers in medical technology.

The funds are to be administered by the National Committee for Careers in Medical Technology. The two students so honored this year are Barbara J. Nelson, 5700 Brockway, Saginaw, who has been attending Delta College, and Carol Lynn Shoksnyder, 6525 Merriman, Garden City, who has been attending Schoolcraft College at Livonia.

College Counselors Thank MSMS, Want More AMA Career Books

MSMS has launched a new effort to provide new accurate information to college counselors about careers in medicine and the many health vocations.

Among the MSMS activities in this field has been the distribution recently of copies of the AMA handbook "Opportunities Unlimited" about health careers.

The response from the college counselors has been gratifying.

In part, the reply from Thomas R. Plough, Dean of Students at Alma College, said, "I feel this AMA handbook will be of value in our career information file. Please send me four more copies. Your concern and interest in this matter is greatly appreciated."

"With our growing biological science and premedical curricula it would be most helpful if you could forward 10 copies of your 'Horizons Unlimited' book for interested students. It would be most helpful if other vocational areas could produce such a useful pocket-book as has the medical profession. With your leadership in this field, others might follow," wrote Michael J. Wiener, counselor at Michigan Technological University at Houghton.

"The pocket-book 'Horizons Unlimited' will be of great value to us in our work with young people," wrote Jean M. Phillips, Director of the Northern Michigan University Counseling Center. The letter asked for 10 more copies for interested students.

Flashback to County Programs 50 Years Ago. . .

What were county medical society meetings like back in the period from 1904 to 1924?

What subjects did the scientific meetings deal with?

These questions can be answered, in part, by reading the "Medical History of Muskegon County," written by William M. LeFevre, M.D., of Muskegon. It was back in 1904 that MSMS Councilor William T. Dodge, M.D., traveled from Big Rapids to Muskegon to help the Port City doctors organize a component society. Prior to that, the Muskegon physicians were formed into the Physicians Mutual Aid and Protective Association. There were 47 physicians in Muskegon County in 1904.

Doctor LeFevre examined the records for the first 20 years of organizational activity, 1904 to 1924, and wrote:

"A total of 244 scientific papers were presented before the Society over this period, mostly by the members themselves, but about one-quarter were by outstanding physicians from other parts of Michigan and near-by states.

"Nineteen percent of these papers dealt with surgery and its allied branches, such as fractures, thyroid disease and gynecology. Thyroid disease was considered surgical at that time because no medical management had as yet been introduced.

"Tuberculosis and lung disease were big factors in the everyday practice of the physician and they were the subject of thirteen percent of the papers.

"Infection other than tuberculosis naturally was of great interest and accounted for ten percent of the papers. This section of the medical field was naturally large, due to the many mill accidents and natural traumatic mishaps. Iodine and carbolic acid were the chief antiseptics in general use, but many a case recovered after the generous use both internally and externally, of the next best antiseptic, whiskey.

"So the above mentioned categories accounted for almost half of the scientific papers of this period and the other half included such other subjects as are of paramount importance to the doctor of today such as pediatrics, therapeutics, neurology, laboratory tests and their use, cardiology and many others."

Hope U-M Postgraduate Center Will Be Ready in Early 1969

With the summer construction strikes over, work has resumed on the $2 million postgraduate medicine center on the grounds of the University of Michigan Medical Center in Ann Arbor. Begun in the spring of 1967, the two-level building will hopefully be complete in January or February of 1969.

THE MAIN TEACHING facility in the building will be the 520 person continental-style Dow auditorium. There will also be a 170-seat lecture hall with a stethephonic communications system between each seat. This system will be used in the teaching of cardiology.

In addition there will be three 50-60 seat classrooms and at least two seminar rooms with capacities for 20-30 people. Also a large exhibit and demonstration hall will be a part of the new center, as well as seven overnight rooms for guest faculty members who frequently take part in the continuing education program.

During the 1968-69 academic year, the University will offer slightly more than 40 courses for physicians and other health personnel.

The importance of continuing education for allied health personnel is outlined by Harry A. Towsley, M.D., director of the postgraduate medical education program:

"In this day of the need for supporting personnel in all medical fields, these courses will give them an opportunity for continuing education programs, helping them to help the doctor give patient care."

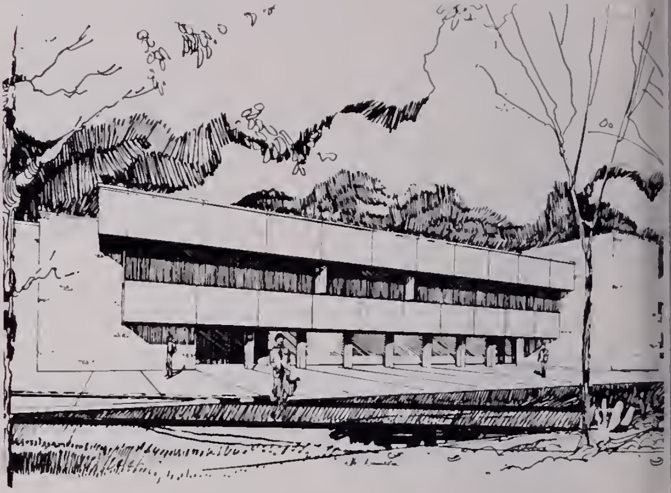
"IN PLANNING THE programs for continuing medical education for physicians," Doctor Towsley says, "every effort has been made by the clinical and teaching members of the faculty to sort from the overwhelming volumes of biomedical literature, that information which is applicable in the day-to-day care of patients."

"We start from where the physician is," he added, "instead of teaching him simply what the researcher wants him to know."

Physician courses are of two kinds at the postgraduate education center: the short, intensive course which runs from 1 to 3 days; and the drive-in course which consists of weekly classes held over a period of many weeks.

THE NEW BUILDING will increase the Potential of the postgraduate medicine program in three basic ways, according to Doctor Towsley:

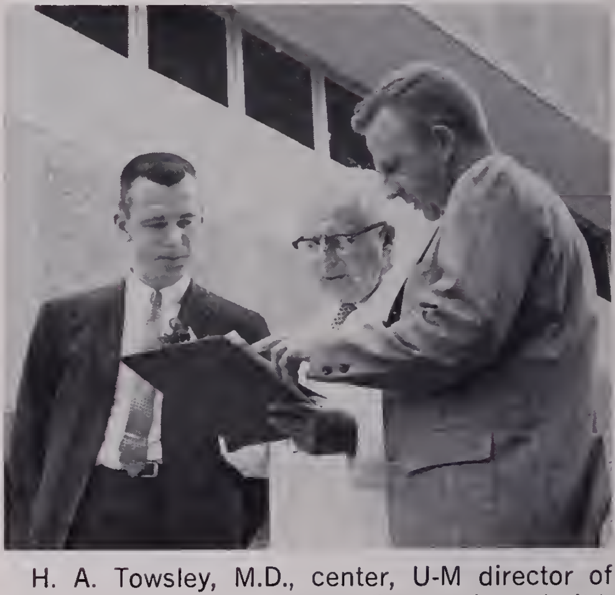
It will permit an expansion of already existing programs and serve as a catalyst for developing new ones.



It will greatly enhance the teaching potential of the post-graduate program because of extensive planning for flexibility in the use of audio-visual aids.

It will serve as a regional meeting place for physicians and other health personnel groups.

Physicians who want further information on the post-graduate programs can write to the Department of Postgraduate Medicine at the University of Michigan Medical School in Ann Arbor.



H. A. Towsley, M.D., center, U-M director of postgraduate medical education, reviews building plans with Ralph E. Lewis, left, and Robert K. Richards, right.

Observations about Health Platforms Adopted by GOP and Dem Conventions:

BY WASHINGTON OFFICE
OF THE AMA

Both the Democratic and Republican 1968 national campaign platforms cited the importance of the role of private enterprise in the development of government health programs. The GOP placed greater emphasis on private medicine than the Democratic party did.

"While believing no American should be denied adequate medical treatment, we will be diligent in protecting the traditional patient-doctor relationship and the integrity of the medical practitioner," the Republican plank said.

THE REPUBLICAN PLATFORM also pledged "to encourage the broadening of private health insurance plans," including extension to cover mental illness.

"Through a partnership of government and private enterprise, we must develop new coordinated approaches to stem the rise in medical costs without lowering the quality or availability of Medicare care," the Democratic platform said.

WITHOUT BEING SPECIFIC, the Democrats indicated support for universal government health insurance or, at the least, wide expansion of Medicare or Medicaid (or both). Boasting of "giant steps" in the past eight years "in assuring life and health for its citizens," their platform said: "We Democrats are determined to take those final steps that are necessary to make certain that every American, regardless of economic status, shall live out his years without fear of the high costs of sickness."

The Democratic health plank also said medical costs could be lowered by more out-of-hospital care, comprehensive group practice arrangements, increased availability of neighborhood health centers, and the greater use of sub-professional aides.

The Republican platform said "inflation produced by the Johnson-Humphrey Administration" was a major factor in the increases in health care costs.

American Medical Association spokesmen appeared before the platform committees of both parties at pre-convention hearings. Donald E. Wood, M.D., Indianapolis, Ind., chairman of the AMA's Council on Legislative Activities, testified at the Republican hearing; John R. Kernodle, M.D., Burlington, N.C., a member of the AMA Board of Trustees, at the Democratic. Their statements were the same.

THE AMA STATEMENT expressed hope that the next federal Administration, whether it be Democratic or Republican, "will provide men and women in medicine, and those engaged in the allied sciences, the opportunity to think and work in a free atmosphere to pursue their common goal of a better and more healthful life for everyone."

The AMA emphasized the desirability of health programs being partnerships among private enterprise and federal, state and local governments. The AMA pledged its support to such cooperative programs for mental illness, infant mortality, occupational health and safety, and education of physicians and allied health personnel.

CONCERNING HEALTH CARE costs, the AMA said:

"We believe that programs to increase the production of medical and other health personnel can be cooperatively and effectively undertaken. We are further firmly convinced that we can and must work toward a health in the inflationary spiral, and toward a productive use of tax dollars expended in the health area. New and old tax supported programs in the health field should be critically evaluated so that while the best health care is attained, overlapping, waste and unnecessary programming are avoided. In this regard, we recommend the establishment of a cabinet-level Department of Health, headed by a physician as Secretary, with overall responsibility for all federal health programs, so that maximum effectiveness may be attained.

"We have always maintained that high-quality medical care should be available for all Americans, including those who need assistance in meeting the costs of such care. . . Firmly convinced that adequate health insurance coverage is the choice mechanism for the financing of quality health care costs, we suggest that the country embark on a program of tax credits for health insurance premiums. Under such a plan, all individuals and families would be encouraged to provide themselves with health care cost protection, with those in financial need receiving the greater amount of tax credit on a graduated basis."

SOCIO-ECON

Manufacturing Rising in State

Manufacturing in Michigan, after posting only modest gains for 1967, is on the upswing again.

The Seventh Federal Reserve District, using an index based on industrial consumption of electric power, reports that the state and other centers located within the reserve district show signs of recovering from production decline.

Saginaw, last year, was the only Michigan city to record a production increase greater than the year before. Rapid expansion of capital expenditures by business in 1965 and 1966 produced massive inventories. This resulted in production "adjustments" in 1967. The slump in automobile sales extended the adjustment to consumer durables.

The five states within the district — Illinois, Indiana, Iowa, Wisconsin and Michigan — account for 23 per cent of the nation's manufactured products. Production of durable goods within the district total some 69 per cent of output. Prosperity is strongly influenced by business expenditures for new plant and equipment.

Manufacturing has grown faster in Detroit, Grand Rapids, Jackson, Muskegon and Saginaw

(Continued on Next Page)

Michigan Medicaid Statistics Offered

Effective October 1, 1966, Michigan Blue Shield was selected formally by the Michigan State Department of Social Services to administer certain benefits of the Title XIX (Medicaid) program for the State, and began immediate servicing of the program. Unlike Title XVIII (Medicare), which is financed by Social Security funds and is a national health care program for persons aged 65 or more, Title XIX (Medicaid) is financed in various formulas of matching funds for various health care services for certain categories of people as determined by the various states. Its benefits vary from state to state but generally pay the full cost of medical service.

In Michigan, Title XIX health care is furnished to two groups of persons. Group One, the "Categorically Needy," is composed of persons who receive financial aid under the State "categorical" programs of Aid to the Blind, Old Age Assistance, Aid to Families of Dependent Children and Aid to the Disabled. Group Two, the "Medically Needy," is made up of persons who support themselves without financial assistance in nonemergency circumstances, but who are judged unable to finance certain medical needs. Their eligibility is this state is determined by a formula based upon income, property and other assets, and family size.

In Michigan, Group One, the Categorically Needy, peaked at 243,732 persons in November, 1967. The pool of persons eligible for Group Two, the Medically Needy, is estimated at 375,000. Therefore, Michigan Blue Shield's total responsibility for service under Medicaid involves 625,000 people, or almost as many persons as the total populations of Lansing, Flint, Grand Rapids and Saginaw.

Table 1 gives an account of the number of services and claims paid during the period from October 1966 to December 1967.

TABLE 1

TITLE XIX — PAID CLAIMS AND SERVICES IN MICHIGAN

Paid Period, October, 1966 - December, 1967

Group I	Amounts	% of Total	Number of Services	% of Total	Average Cost Per Service
Old Age Assistance	$ 2,984,979	20.17%	782,070	33.89%	$ 3.82
Aid to Blind	145,882	0.99	25,242	1.09	5.78
ADC Adults	4,105,906	27.74	600,327	26.02	6.84
ADC Children	2,498,705	16.88	348,782	15.12	7.16
Aid to Disabled	2,733,114	18.47	438,556	19.00	6.23
Total Group I	$12,468,586	84.25%	2,194,977	95.12%	$ 5.68
Total Group II	$ 2,330,923	15.75%	112,610	4.88%	$20.70
Total Group I & II	$14,799,509	100.00%	2,307,587	100.00%	$ 6.41

than in the United States as a whole: seven per cent annual growth between 1960-66 compared to six per cent for the nation. The growth is attributed largely to production of automobiles and related equipment.

Michigan produces 40 per cent of the country's motor vehicles and more than a third of the district's production of durable goods. The auto industry, however, is strongly cyclical.

Michigan's production of non-durables, while showing a slower growth rate, exhibits greater growth stability. Food products and chemicals account for more than half of the state's manufacture of non-durable goods. More than 40 per cent of Battle Creek's output is in food products while almost 60 per cent of Kalamazoo's manufacturing is in chemical and paper products.

Although neither city has enjoyed the rate of manufacturing growth experienced in durables, both have shown stable increases of about six per cent per year. ☐

Sees Medical Schools Graduating 10,000 Each Year by 1975

"Today, the United States has a physician population of approximately 300,000. This includes approximately 185,000 physicians who are in private practice; about 55,000 who provide medical service in other than private practice, (as full-time members of hospital service staffs or medical school faculties, in administrative, laboratory or preventive medicine, or in research); and more than 45,000 who are completing hospital internship or residency training. The remaining 15,000 are either retired or not presently practicing medicine."

"By 1975, at least 350,000 physicians will be required to meet the nation's growing needs for physicians, according to the United States Public Health Service. It estimates that physicians will be graduating at the rate of 10,000 a year by then — a rate nearly 2,500 greater than that achieved in the 1965-66 school year when 7,574 physicians (an all-time high) were graduated."

"To provide the additional physicians which are necessary, the nation's medical schools are concentrating on accelerating their already-impressive expansion programs. Approximately 20 new medical schools now are envisioned, including 13 which already are in various stages of development."

—AMA Horizons Unlimited

Forecast Trends In State Economy

The Federal Reserve notes that local interruptions in manufacturing activity have pronounced effects on industrial output. In 1967, the Detroit automobile strike and the summer riot contributed to overall decline in productivity.

On the basis of technical reports prepared by the State Resource Planning Division of the Michigan Department of Commerce, the following observations can be made:

1. Total employment in Michigan is forecast to rise from 2,740,500 in 1960 to 3,960,000 in 1980, an employment growth of 44 percent. On an annual basis, this would constitute an increase of 1.9 percent per year from 1960 to 1980. Thus Michigan's growth would parallel the national rate.

2. Medical and other professional service employment is forecast to rise by 539 thousand or 164 percent from 1960 to 1980.

3. With the exception of apparel manufacturing which is forecast to rise 167 percent, manufacturing employment is expected to grow moderately and in some instances (e.g., food products, textile mill products, lumber and wood products) to experience declines.

4. Michigan will be called upon to turn out more services relative to goods in the 1970's with travel, education, medical and hospital services absorbing more cents to each consumer dollar.

5. Medical and other professional services, public administration, finance, recreation, trade and business services will be the rapidly growing fields of economic opportunity from now to 1980.

6. From 1960 to 1980, employment in medical and other professional services are expected to increase at rates ranging from 147% in the Detroit 7 Area to 198% in the Jackson area.

7. Michigan will grow from 7.8 million in 1960 to 9.9 million persons in 1980 or 26.1 percent according to forecasts prepared under the State Resource Planning Program.

8. With regards to changes in the age composition of the work force, projections indicate an absolute decline in the number of persons available in the labor force in the age groups between 35 and 50 years of age for 1980 as compared with 1960.

For a more complete analysis details may be studied in "Michigan's Future, It's Population and It's Economy," Technical Report Number 10B, State Resource Planning Program, Michigan Department of Commerce.

AUDITOR OFFERS:

Year End Tax Planning

BY KENNETH B. KNOSTMAN, C.P.A.
LANSING

Doctors of Medicine became subject to SELF EMPLOYMENT TAX for years ending on December 31, 1965, and each year thereafter.

The 1968 rate, including Medicare, is 6.4% of $7,800.00 for a maximum tax of $499.20. These rates are currently scheduled to increase progressively to 7.8% by 1987.

ARE YOUR PROFITS particularly high this year? If so, consider the following:

1. Make needed repairs before year end, and deduct the cost.
2. Stock up on routine supplies. (Drugs, tape, bandages, etc.)
3. Delay billing of patients until 1969.
4. Pay year end bonuses before December 31.

(Should you expect 1969 to greatly exceed 1968, then, reverse the above procedures. Remember, tax savings are accomplished by a "level income" — avoid extreme highs and lows.)

* * *

ARE YOU CONSIDERING the purchase of x-ray, or other expensive equipment with a useful life of at least six (6) years? If so, plan the year of your purchase in order to reap the following tax benefits:

1. An extra 20% depreciation can be taken on the first $10,000.00 cost ($20,000.00 on a joint return). This extra deduction of $2,000.00 on a single return ($4,000.00 on a joint return) may be taken regardless of how late in the year the equipment is put into service.

2. The 7% investment credit would also apply to this purchase (8 year useful life required for full benefit — 6 year life would allow 7% credit on 2/3 of your cost). Again, the credit applies no matter how late in the year your purchase is made.

Example: You buy, and put into service, the $10,000.00 machine in December. You may deduct $700.00 DIRECTLY FROM YOUR TAX.

CONTRIBUTIONS OF appreciated property, rather than money, can save tax dollars.

Example: You own a vacant lot that cost you $500.00 in 1950 — current market value of $2,000.00.

(a) If you sell the lot and donate the $2,000.00 to charity, you will have a net deduction of $1,250.00.

($2,000.00 donation, less taxable gain of $750.00. [50% of $1,500 actual gain]).

In the 50% income tax bracket, your tax is cut by $625.00 because of the donation and sale.

(b) By donating the lot to charity, you will reduce your income by $2,000.00, and the increase in value over the 15 year period isn't considered.

Tax is reduced by $1,000 — a saving of $375.00.

NEW MSMS MEMBERSHIP

MSMS now has available a gold-filled Official MSMS Membership Pin for use in the coat lapel, as a tie tack, etc. Send check made out to MSMS for $3.00 to Michigan State Medical Society, 120 West Saginaw, East Lansing, Michigan 48823.

Measurement of Quality and Quantity Of Medical Services

ABSTRACT: Alternative methods of measuring quality and quantity of medical services are reviewed and two methods of measurement under development at Michigan Blue Shield are described.

BY GORDON TAAFFE, Ph.D.
MICHIGAN MEDICAL SERVICES

Objectives of medical care are to relieve human suffering and/or to prevent conditions which lead to suffering. Evaluation of the ways and means that these objectives are met is a necessary part of the medical profession. Self evaluations by the medical profession provide standards of care and upgrade medical services generally. Economic pressures resulting from increased demands and rising costs of medical care necessitate efficiency and cost-benefit analyses of the organization, administration, and delivery of medical care. Basic to these evaluations, however, is the measurement of quality and quantity of medical services.

Sidel[1] describes three ways to measure medical care. They are: 1) to test the knowledge and skills of physicians, 2) to judge methods and practices of physicians by reviewing their records or by observing their work, and 3) to evaluate the end result of the physician's effort, the patient. Each method has advantages and disadvantages. Testing the knowledge and skills of the physician is experimentally the most reliable method of measurement of the three described and in a statistical sense, the most valid. The physician's tested knowledge is compared with a vast amount of medical fact and objective assessments of discrepancies between fact and test results can be reliably made. This kind of measurement is common to medical training and later is a part of specialty boards and other certifying agencies. Testing medical students and physicians has reached a high degree of sophistication and no one has much to quarrel with over this method of measurement.

IT DOES NOT NECESSARILY follow, however, that the well-tested physician who tests well will in fact perform better in practice than will the physician who tests poorly. That is to say, training performance does not necessarily predict subsequent on-the-job performance. Good training is a necessary condition for medical practice but it is not a sufficient condition for excellence in medicine. It is not known, for example, whether the well-trained physician will keep up with the advances of his profession, use sound judgment, or in other ways be a "good doctor." While assuring high standards is an admirable characteristic of the medical profession, good training is not a sufficient index of uniform excellence of medical services.

Reviewing the records of a physician by his peers is a common method of measuring quality of hospital care. This method brings into play many qualitative assessments of various medical procedures and practices. The diversity of medical care and the idiosyncrasies among physicians create wide variability of standards of care, a factor which complicates the reviewing process. The fact that the ultimate responsibility for the care of a patient rests with the attending physician permits the establishment of a variety of standards of care rather than a uniform standard. In addition to these weaknesses in measuring quality and quantity of medical services, the review phy-

This is another in a series of Michigan Blue Shield articles on Utilization Review. The author, Dr. Taaffe, is Associate Director of Utilization Review research staff. He has conducted psychological and educational research studies before coming to Blue Shield. He is also an adjunct professor of psychological statistics and research methods at the University of Detroit. Doctor Taaffe is a member of the American Psychological Association and is listed in Who's Who in American Education and in American Men of Science.

—Louis F. Hayes, M.D.,
Vice President,
Medical Affairs Division

sicians are faced with a large volume of cases to review, a condition which often leads to either reviewing in a superficial way or to selecting extremely atypical cases for review.

HOME AND OFFICE medical services, which comprise the bulk of most physician's medical practice, lie entirely outside the pale of utilization review. Gross malpractice may come to the attention of local medical societies but peer review of routine home and office care is noticeable by its absence.

Finally, going to the patient to measure quality and quantity of medical services presents several problems. To have patients appear before a panel of review physicians is impractical except for exceptional cases and asking the patient about the care he received does not often yield reliable information. Patients that expire do not, of course, permit review. Patient review is the least promising way of measuring medical services of the three methods described.

In contrast to the methods of measuring quality and quantity of medical services just described, Blue Shield is developing two methods of measurement. The two methods capitalize on the voluminous data on health care that Blue Shield accumulates. The first method is computer-assisted peer review. Using this method, the computer will identify atypical cases of medical care for review by a panel of physicians. Computer identification of atypical cases will be based on norms of care for particular illnesses and on medical procedures followed in the treatment of the illness. Norms of care with respect to length-of-stay, post-operative length-of-stay, and other similar variables will be derived from records of utilization while procedures typically followed will be based on criterion indices established by the medical profession. For example, distributions of selected characteristics of medical services will be determined and parameters of the distribution computed. Modal frequencies, medians, and arithmetic averages, ranges, and variances of care will be computed. The several quantitative measurements together will define a domain of medical care, for example pneumonia. Quality of care will be evaluated with reference to these normative criteria. Causes for review of a case will be based on cases which fall in the extremes of normative distributions or which have atypical procedures or both. Constraints with respect to age and sex of the patient as well as severity and complications of the illness will be incorporated into the automated reviewing procedure. Blue Shield records of utilization will serve as the primary data for analysis.

For Your Library

Copies of "A Century of Service in Medicine," published as a Centennial highlight by MSMS, are still available for cost, $2.00. The book, bound handsomely in blue, was written by Wm. J. Stapleton, Jr., M.D., of Detroit, the MSMS Historian. To obtain a copy, write to MSMS, 120 West Saginaw, East Lansing, and enclose a check.

WHILE THE COMPUTER-assisted peer review is oriented towards case studies, pattern and profile studies are directed more toward the measurement of quality and quantity of medical care in the community. This second method of measurement under development at Blue Shield will seek to describe characteristic medical utilization in the community. In these studies, profiles of providers and users of medical services will be established in preliminary studies and patterns of characteristic usage will be under continuing analyses. Quality of medical services will be established on a demand-resources basis as well as on quantitative and qualitative characteristics of providers. Profiles for hospitals, for example, will describe the distribution of hospitals in Michigan by community, number of beds, average number of patients, type of hospital, and other similar characteristics. Relevant variables for physician profiles will be such characteristics as training, specialization, type of practice, professional appointments, and so on. Patient characteristics will be age, sex, family structure, insurance benefits, geographic location, and other similar variables. While profile studies will be largely descriptive, pattern studies will seek to link together the patient with his physician and hospital. Characteristic medical utilization will be the objective of the pattern and profile studies.

Evaluation of current allocation of medical resources against demand patterns for those resources may offer economic insights as well as indices of quality of medical care. Pattern and profile studies will be quite varied and should offer comprehensive analyses of medical utilization in Michigan.

Durbin[2] describes quality of medical care as "the method of determining how close observations of care meet prior expectations of care." Blue Shield will establish "prior expectations" on a statistical basis and will review atypical cases professionally. Both Blue Cross and Blue Shield records of utilization will be analyzed. The records represent not only hospital care but also clinic and home and office medical services. These methods of measurement of quality and quantity of medical services appear to be the most appropriate review of medical services for Blue Shield. It goes without saying that these methods of measuring quantity and quality of medical services are dependent upon vast amounts of medical utilization information and on computers with tremendous data processing capabilities. Blue Shield has the utilization information and computers and a research staff is presently attempting to cope with problems of analysis.

NINE NEW CANCER FILMS OFFERED MD AUDIENCES

Nine new 16 mm color and sound films on cancer are now available free of charge for viewing by physician audiences, the American Cancer Society announced recently.

The films are entitled as follows: "Cancer of the Skin;" "The Diagnosis and Management of Cancer of the Colon and Rectum;" "Cancer in Children;" "Uterine Cancer: Diagnosis and Management;" "Oral Cancer;" "Hormone Therapy for Advanced Cancer;" "Tumors of the Major Salivary Glands;" "Early Diagnosis and Management of Breast Cancer;" and "Cancer of the Stomach."

Groups of physicians who want to view the films can obtain them from their local unit of the American Cancer Society. □

An American Custom

"The Americans of all ages, all conditions and all dispositions constantly form associations. They have not only commercial and manufacturing companies in which all take part but associations of a thousand other kinds, religious, moral, serious, futile, restricted, enormous, or diminutive. The Americans make associations to give entertainments, to found establishments for education, to send missionaries to the antipodes. Wherever at the head of some new undertaking you see the government of France or a man of rank in England, in the United States you will be sure to find an association."

Alexis De Tocqueville
1805-1859

AMA
22ND CLINICAL CONVENTION
MIAMI BEACH
DECEMBER 1-4,1968 · CONVENTION HALL

. . . the American "Riviera." Where glittering luxury hotels tower above glamorous Collins Avenue; and medicine, sea and sunshine mix in a delightful subtropical setting.

Register now, and be on hand for the world's largest winter medical meeting—the AMA's 22nd Clinical Convention. At this midwinter "summer" session in medicine there will be Three Postgraduate Courses: Fluid and Electrolyte Balance, Diabetes, and Hyperthyroidism in the Elderly Patient • 17 Scientific Sessions • Breakfast Roundtable Conferences • Color Television • and Medical Motion Pictures. The modern, air-conditioned Convention Hall will house hundreds of scientific and industrial exhibits to show you the very latest in equipment, services and drugs.

Plan now to join your colleagues in Miami Beach. Be sure to look for the complete scientific program, plus forms for advance registration and hotel accommodations in the October 21st issue of JAMA.

Geigy

onedownmanship

Regroton® chlorthalidone 50 mg.
reserpine 0.25 mg.

One Regroton tablet a day usually helps you and your patient bring high blood pressure down and keep it down.

Regroton produces a smooth, long-acting effect that usually reduces both systolic and diastolic pressures. At the same time it often acts to allay anxiety and nervous tension associated with hypertension.

Although Regroton is generally well tolerated, adverse reactions may occur. This drug is contraindicated in mental depression, demonstrated hypersensitivity, and most cases of severe renal or hepatic diseases. For a complete list of side effects, please see the Prescribing Information summarized on the following page.

Regroton®

chlorthalidone 50 mg.
reserpine 0.25 mg.

onedownmanship

One Regroton tablet a day usually helps you and your patient bring high blood pressure down and keep it down.

Indications: Hypertension. **Contraindications:** History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases. **Warning:** With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has frequently been required and deaths have occurred. Discontinue coated potassium-containing formulations immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur. Discontinue one week before electroshock therapy, and if depression or peptic ulcer occurs. *Use in pregnancy:* Because chlorthalidone may cross the placental barrier and appear in cord blood and thiazides may appear in breast milk, this drug should be used with care in pregnant patients and nursing mothers. When used in women of childbearing age, the potential benefits of the drug should be weighed against the possible hazards to the fetus. Use of chlorthalidone may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. Increased respiratory secretions, nasal congestion, cyanosis and anorexia may occur in infants born to reserpine-treated mothers. **Precautions:** Antihypertensive therapy with this drug should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs, or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. To avoid hypotension during surgery, discontinue therapy with this agent two weeks prior to elective surgical procedures. In emergency surgery, use, if needed, anticholinergic or adrenergic drugs or other supportive measures as indicated. Because of the possibility of progression of renal damage, periodic kidney function tests are indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated. Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, the drug should be discontinued and potassium supplements given, provided the patient does not have marked oliguria. Take particular care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Severe salt restriction is not recommended. Use cautiously in patients with ulcerative colitis or gallstones (biliary colic may be precipitated). Bronchial asthma may occur in susceptible patients. **Adverse Reactions:** The drug is generally well tolerated. The most frequent side effects are nausea, gastric irritation, vomiting, diarrhea, constipation, muscle cramps, headache, dizziness and acute gout. Other potential side effects include angina pectoris, anxiety, depression, bradycardia and ectopic cardiac rhythms (especially when used with digitalis), drowsiness, dull sensorium, hyperglycemia and glycosuria, hyperuricemia, lassitude, restlessness, transient myopia, impotence or dysuria, orthostatic hypotension which may be potentiated when chlorthalidone is combined with alcohol, barbiturates or narcotics, leukopenia, aplastic anemia, skin rashes, thrombocytopenia, agranulocytosis, nasal stuffiness, increased gastric secretions, nightmare, purpura, urticaria, ecchymosis, weakness, uveitis, optic atrophy and glaucoma, and pruritus. Eruptions and/or flushing of the skin, a reversible paralysis agitans-like syndrome, blurred vision, conjunctival injection, increased susceptibility to colds, dyspnea, weight gain, decreased libido, dryness of the mouth, deafness, anorexia, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Jaundice, xanthopsia, paresthesia, photosensitization and necrotizing angiitis are possible. **Average Dosage:** One tablet daily with breakfast. **Availability:** Pink, single-scored tablets in bottles of 100 and 1000.

Industry, Physicians, Legislators, Others Seeking Solutions to Air Pollution

BY JULIE ORWIG
LANSING

—In 1952 and again in 1962 a thick, impenetrable smog fell over London. The first time, the stifling seige last two weeks, the second only four days. However, the results in both instances proved the same when Mother Nature finally and sympathetically cleared the air — the city had suffered extensive property damage, but more importantly, soaring death rates were reported during these brief periods.

—In New York City, Ernest L. Wynder, M.D. and Dietrich Hoffman, M.D., of the Sloan Kettering Institute revealed the results of a startling experiment. For six weeks the doctors kept a truck, built to act as a human lung, parked in Herald Square. The truck sucked in thousands of cubic feet of air and ran it through filters. At the end of the six weeks the doctors scraped a thick residue from the filters. Reducing this to its chemical components, they put it on the backs of mice. Eventually, 90% of the mice developed cancer.

—In 1961 a poll revealed that in Los Angeles, where the secret of photochemical smog had been discovered, doctors have told over 10,000 patients to leave the area for their own good.

Certainly these are some of the more dramatic examples of the problems presented by air pollution. However, it has taken just such startling revelations and too often disasters to finally awaken man to the fact that he is creating a virtual sewer from the air he breathes.

Edward Edelson and Fred Warshofsky, in their book, *Poisons in the Air,* report "that the history of air pollution is largely a tale of two cities — London, where the air is historically worse than any other place on earth, and where the greatest air pollution disaster ever recorded occurred; and Los Angeles, which introduced the world to a new type of air pollution, then blazed a trail toward cleaning it up."

BUT AIR POLLUTION is no longer simply a historical problem experienced by a few of our largest cities. Air pollution is here and now — in Michigan. And it is everyone's enemy whether he lives in the city or surrounding countryside. And it is a problem to be reckoned with as technology threatens to spew even increased amounts of poison into the atmosphere while urban living cramps greater numbers into smaller areas.

In 1960 statistics gathered by a U.S. Senate committee confirmed that 43 million people lived in cities with "major" air pollution problems. Another 30 million reportedly lived in areas with problems described as "moderate."

The idea that polluted air could cause disease is by no means new. Medical history reports that at one time cholera, smallpox, diptheria, scarlet fever, yellow fever, malaria and even syphilis were all erroneously thought the result of "bad air."

Now medical science is actually beginning to find that our respiratory systems can be greatly effected by polluted air. But the smoke is only beginning to clear on the relationship between pollution and respiratory disease. Most medical authorities will now admit, however, that there is at least some relationship between the two.

MORTALITY AND MORBIDITY rates seem to support this belief. In the "Journal of Environmental Health," Mel Weisburg, M.D., of the American Medical Association, reports that lung cancer mortality is twice as high in cities as in rural areas, more or less proportionate to the size of the corresponding population. Death rate sta-

Photo, Courtesy of Michigan Department of Public Health

tistics from London; Donora, Penn., and the Meuse Valley in Belgium, where smog disasters have occurred, add further evidence that polluted air is detrimental to the respiratory system.

The extent to which air pollution affects respiratory disease is unknown. One thing is certain, however. Both pollution and this type of disease are on the rise. Just how proportionately the two are related is the dilemma of physicians, government officials, concerned citizens — all those who are attempting to do something to clean up the mess.

OFFICIALS ARE NOT dealing with a disease such as malaria, now known to be caused by five or more species of parasitic protozoa and transferred to the human blood by mosquitoes. The exact causes of asthma, chronic bronchitis, emphysema and lung cancer are unknown.

Government officials find it difficult to move in, as in the case of malaria, and tell a man to clean up the swamp behind his home because it is a breeding place for malaria carrying mosquitoes. With respiratory disease it is not easy to force industry and individual citizens to install emission devices or to stop burning rubbish. The burden of proof lies with the scientist and researcher.

The old adage of "man or mouse" further complicates the case for science. It is virtually impossible to reproduce in the laboratory with any degree of certainty, the gradual effects which an ever-changing polluted atmosphere may have on a human being. Researchers are constantly reminded of the dangers involved in assuming a similarity between human and animal reactions to an experiment.

Much is also being done outside the researchers laboratory to further the cause of clean air. On the national scene the federal government passed the Clean Air Act (88-206) in 1963 which provided for federal grants amounting to $95 million to match local expenditures aimed at the control of air pollution. This contribution has been increased when two or more cities or states join forces in combatting pollution.

In 1965 an amendment (89-272) was passed giving the Secretary of Health, Education and Welfare the power to set emission standards for automobiles and trucks. Providing for the construction of needed research facilities, a total of $92 million over four years was authorized for studies of the problems of waste disposal.

As a result of this amendment newly installed devices on 1968 model cars will reduce hydrocarbon emissions by 60% and carbon monoxide emissions by 50%.

The federal House and Senate this year passed S-780, known as the Air Quality Act which authorizes $428 million over three years to continue and expand efforts of the earlier acts. Under this law states will be given the upperhand in abating air pollution with the federal government stepping in only if their efforts should fail. The law authorizes a two-year study of national pollution standards and will permit states to set their own goals in this area. The Secretary of Health, Education and Welfare is given the power to establish air quality regions and set up commissions to govern regions where air pollution overlaps two or more states or areas.

IN MICHIGAN, THE state legislators are protecting their authority from federal government intervention while at the same time helping to clean up Michigan air through the enactment of new laws.

In 1965 Acts 348 and 250 were passed by the 73rd Legislature. Act 348, known as the Air Pollution Control Act, provides for the creation of an Air Pollution Control Commission within the Department of Public Health. Under this act, the Commission is licensed to promulgate rules and regulations to control air pollution, to compel witnesses in complaint cases to attend hearings, to institute court proceedings against offenders and to provide inspection and approval of air cleaning devices. Act 348 was amended this year to provide that nothing in its content be inconsistent with federal regulations on motor vehicles.

On February 3, 1967, the federal Control Commission adopted a set of rules and regulations to be applied when a written complaint is filed with the Commission against a possible polluter.

Act 250, also passed in 1965, provides that industries may make application with the state tax commission for exemption from real, property, use and sales taxes on air pollution control facilities which they install. The procedures for obtaining such exemptions were further clarified in an amendment (Act 145) passed by the 74th Legislature.

THE LAWMAKERS ARE not the only people in Michigan who are helping to solve the problems of contaminated air. As the spokesman for and protector of the interests of industry, the Michigan State Chamber of Commerce in a recent report applauds the advances being made in correcting pollution.

The Michigan State Chamber, having sold legislators on the idea that incentives would produce better results than punitive measures, was instrumental in promoting the passage of the state act of 1965 which allows for tax exemptions for industrial installation of pollution control devices.

While it is hard to condone industry's reluctance to install air pollution abatement and control devices, still it is understandable. An investment in such facilities does not increase productivity and it does raise the cost of manufacturing.

Industrial agencies are beginning to accept their responsibilities in this area, however. Harold E. Thayer, Chairman of the National Association of Manufacturers Area Industrial Problems Committee, speaking at the National Conference on Air Pollution last December, reaffirmed the contention that industry needs economic incentives, in the form of tax credits, for the installation of pollution control facilities.

As easy as it is to find a whipping boy, industry alone is not responsible for the condition of today's air. Individual refuse burning, smoke from salvage operations and the automobile contribute their share to pollution.

IN THE CASE OF the automobile, the new 1968 exhaust-control additions will help the problem. More research and development are necessary.

On a positive note, Jay A. Bolt, professor of mechanical engineering at the University of Michigan whose present research deals with engines and air pollution, states that present gasoline-powered automotive engines can, at increased cost to the consumer, be further developed to meet any reasonable anti-pollution emission standards.

The Michigan Association of the Professions is concerned too about air pollution. The 1963 Congress of the Professions adopted a resolution which declared, "that MAP directly and in cooperation with its state organization members, support the passage of any necessary legislation to permit the health authorities of Michigan to rid the state of pollution in the air insofar as that can be accomplished by state authority and also that MAP join with other groups, of like policy, in programs of public education in the support of anti-air-pollution efforts."

The MAP resolution declared, in part, that "one of the greatest health menaces facing the people

of Michigan and particularly the residents of Michigan cities is polluted air." The resolution urged preventive action programs in the interest of better health.

It is apparent that industry, researchers, lawmakers and independent community groups are all beginning to take an active part in helping to clean up the air pollution mess.

BUT WHERE DOES the medical profession's responsibility lie in this area?

Ultimately, if air pollution is not controlled, doctors, by virtue of their profession, will have to accept responsibility in caring for the millions of people who will be affected. Hopefully, there will be no more London disasters.

The American Medical Association is taking an active role in the fight. Believing that air pollution is primarily a problem best solved at local levels, the AMA has done much to encourage and support local medical participation in community control activities. For example, the AMA added its support to the Los Angeles County Medical Association's efforts in assisting local authorities in setting up emergency alert levels for pollution and in supporting legislation dealing with auto exhaust and fuel oil burning.

Another function of the AMA is to provide liaison with public and private groups to represent the profession's interests in air pollution disputes. AMA committees have been largely responsible for the preparation of informational documents and statements on air pollution for medical, technical and lay groups.

THE AMA BOARD of Trustees in April, 1965, approved creation of the Joint American Institute of Architects-American Medical Association Committee on Environmental Health. It is hoped that through this committee environmental problems such as air pollution will be more effectively approached through architectural design and planning.

The Michigan State Medical Society House of Delegates has resolved to support and commend the state legislature for their passage of pollution acts 250 and 348.

California, Illinois and New York medical societies have all formerly adopted air pollution programs.

The ills of dirty air can only be cured through individual concern and participation — and this includes the concern and participation of Michigan's physcians.

The AMA's "Physicians Guide to Air Pollution" states, "The physician who advises patients to move on account of air pollution also has an interest in promoting air pollution control in his community. He has a stake in securing purity of air in the same way he has in other biological needs — food, drugs, water. While the control of air pollution may appear beyond the scope of his practice, the physician can contribute medical standards and informed leadership to the community effort."

MSMS PRESIDENT URGES DOCTORS BE INVOLVED IN ANTI-POLLUTION

"The most effective approach to air pollution problems is the grass-roots, community approach."

So declared MSMS President B. M. Harris in a recent editorial in *Michigan Medicine*. He wrote:

"As physicians we have a community responsibility both individually and collectively through our professional and civic organizations to accept the challenge of helping clean the air we breathe."

Doctor Harris urged every MSMS member "to familiarize himself with his community's regulations on air pollution and their enforcement."

The MSMS President also wrote, "The medical fraternity, the ultimate recipients of victims whose exposure has progressed to the symptomatic stage (at which point the only help may be palliative) has both the opportunity and responsibility to participate actively in programs now underway and to eliminate the various sources."

The individual physician in his practice is concerned about the possible effects of pollution on his patients as he studies air pollution data published by local and other government agencies. And more and more doctors are taking an active part in efforts to clean up the present condition of the air.

Blue Shield Data Processing Nears 150,000 Inputs Daily

Michigan Blue Cross "went computer" in 1955, when it installed an IBM 705 to handle all data processing for itself and Michigan Blue Shield.

Blue Shield's own Data Processing Department came into existence shortly before the advent of Medicare in 1966. It has grown from an original four employees, who coordinated Blue Shield business with the Blue Cross Data Processing Center, to 264 employees involved in a completely separate and independent computer operation.

In June, 1966, Blue Shield took delivery of its first computer, an H200. Its computer staff grew to 78 trained specialists by October of that year, when the computer was transferred to the 17th floor of the Cadillac Tower Building.

Further expansion of the operation occurred when Blue Shield assumed administrative responsibility for Medicaid in December of 1966, and in the spring of 1967 the company began to computerize regular Blue Shield business. At this point the writing of statistical reports and check-writing formerly done by Blue Cross were phased into the operation and 40 more keypunchers added to the staff.

Blue Shield Data Processing came to maturity in August, 1967, as a formally organized Group, complete with Planning & Control, Systems, Programming, Data Control, and Computer Operations departments. Today, the only joint work done between the Blues' two operations is the checking of Blue Shield's daily input against Unifile's enrollment information, and billing.

Low volume programs such as CHAMPUS are processed on keypunch cards. Programs as vast as MEDICARE are computerized. Eventually, all Blue Shield, Medicare and Medicaid pricing will be done by computer.

The use of Data Recorders not only saves 34% in operations expense for data conversion but results in greater speed in processing information, since the computers can read magnetic tape 60 times faster than cards.

Blue Shield's Computer Room, equipped with two H2200 computers with 65K (a tape-oriented system), plus the original H200 computer, handled a volume of 146,000 "inputs" daily during March of 1968, or 81,000 more daily inputs than during the same month in 1967. In addition, by means of a Digitronics Remote Terminal, a machine tied by direct line to Social Security Administration headquarters in Baltimore, Blue Shield transmits and receives Medicare information directly on magnetic tape.

At work in Blue Shield computer operation are Fred Hasson, Nick Kristo and Gary Chick.

While Blue Shield Data Processing is completely modern, plans are already being made for years ahead.

A utilization file of six million case histories is undergoing long term review by MBS to determine what medical services are being used, and how. Such case histories, properly authorized for use, may in the future furnish valuable emergency information about the past ailments, medications and doctors of a patient in a coma.

At this moment Data Processing is gearing to handle an estimated 383,000 inputs daily by 1975, including data concerning the prescription and dental services which are sure to come. This is one more aspect of a progressive modern company with an eye to future, as well as present needs. ☐

Many Colombian men and women, seeking help for themselves and their children, crowd at the docks when the Ship Hope docks to provide medical care.

Enteritis, Gastritis Among Leading Causes Of Death in Colombia

This article describes some of the experiences by Mary L. Cretens, M.D., Gladstone, during a two month rotation, while the Ship Hope was in Colombia. Doctor Cretens is director of the Delta County Department of Health.

My two-month Rotation on the Ship Hope at Cartagena, Colombia, provided an opportunity to observe a kaleidoscopic picture of several decades of medicine. Some areas of medical care were many years behind our own and others were more current. Many Colombian physicians were very receptive to new ideas, some not. It was revealing to see yourself and your reactions reflected in many of the local medics.

Improvisations were important and generally we lacked much talent in this field, although the Colombians were no better. The Colombians were used to letting repairs of equipment and housing go until the equipment or housing was no longer useable, then they would discard it, often with no replacements.

I was somewhat prejudiced, but I felt the Public Health — General Practice Rotation was the best. All physicians had duties both on and off ship, but the two above mentioned had more functions on land. As I had a combination General Practice-Public Health Rotation, I had ample opportunity to observe sick and well people alike. I was priviledged to visit all the health and sanitation facilities of the area. I worked in the Ship hospital and sick bay, the city hospital, the outpatient clinics, and even made home visits and treated patients in their homes. I had a variety of interpreters which learned from me and my predecessors much about medical counseling. They all promised to carry on the continuing land based program sponsored by the Hope. This program will offer service for several years in Colombia. The interpreters were very intelligent women, many from influential families, that could put their finger on the source or cause of health problems. Their interpreter work had drawn them closer to all the people in this two-class society.

The feelings of a true medical-speciality team soon developed among the Rotators and was fostered by quarters so small that if the beds were placed side by side, instead of stacked, there would be no room for walking through the room. The team spirit was helped further by the fine, large, well set tables in the dining room and the group "deck" sessions in the evening. Age of the practitioner made no difference, in fact the most active practitioner on our Rotation was the oldest.

Colombia is a very rich country in resources. Poor distribution of goods and lack of development has prevented the masses from having adequate food and housing (average annual income is $175.-00). There is an extremely high birth rate and 50% of the children are under 15.

The father most often claims little family responsibility for his children, so very few children are educated. This inadequacy of education leads to the crux of their health problems. For example, there is no conception of proper diet. Sweets, fat, and starch are often eaten almost exclusive of other foods. Lack of potable water, coupled with lack of knowledge of cleanliness, plus tropic heat makes for nearly 100% infestation with amoeba, ascaris and the like.

People often do not even know how to get medical help and when they do seek medical help, they must sometimes wait two days to be seen. The

MARY L. CRETENS, M.D.
GLADSTONE

serious cases are not sorted from the insignificant diseases and so the serious problems are not given priority. Often people will not seek the physician's help at all; they will only go to the druggist who dispenses everything but narcotics.

Important causes of death are enteritis and gastritis. Heart disease is relegated to the number four cause of death. One poor lady counted and saved 420 worms her one year old child had passed, but she never considered seeking medical help for the child until we visited her home.

Generally diseases were much the same as elsewhere, except for incidence and severity. Almost all diseases were complicated by malnutrition and anemia. For the physician interested in epidemiology there are many interesting areas; for example, great incidence of enlarged thyroids in a seacoast living people, and the reversion in adults of blood cell patterns similar to those of childhood.

The greatest challenge and opportunity to the Rotator comes in teaching or, as I like to see it, the exchange of ideas. Much can be done by making comparison of methods and arriving at possible alternatives to solve problems.

What is needed in a country such as Colombia is better education at all age levels and the training of more medical and especially paramedical personnel and retraining old personnel in new methods of prevention, diagnosis, and treatment. Generally the Hope is doing just that, so it continues to have lasting value as contrasted to most of our other foreign programs.

State Appellate Court Ruled Hospital Records Admissible in Estate Suit

(Editor's Note: The following article is quoted from the AMA Citation newsletter of August 1, 1968, prepared by the AMA Law Department.)

In a proceeding to determine the validity of a will executed by a testator in a hospital a short while before his death, his hospital records were properly admitted in evidence on the issue of his mental competency. The records met the requirements of the Business Records Act, a Michigan appellate court ruled. An internist's testimony on the testator's competency was also properly admitted.

A hospital employee who was the custodian of records identified the records offered in evidence as those of the patient. He testified that the entries were made in the regular course of the hospital's business and that they were made at or near the time the will was executed. He also testified that the records, including the nurses' notes, were used by the physician in the course of the patient's treatment. The physician who treated the man also testified as to the hospital's procedures in keeping patients' records. He further testified that the observations of nurses and others were of particular importance in this case because the patient was suffering from acute cirrhosis of the liver. There were 15 nurses, as well as numerous laboratory and X-ray technicians associated with the patient's treatment. To have required the calling of each of those persons would not have served any useful purpose, since the records' reliability had been established.

The will's proponent objected to the internist's testimony as to the testator's competency on the ground that his opinion was based solely on the hospital records. However, the evidence showed that he had examined the testator a short time before he was admitted to the hospital. The internist was eminently qualified in his field and was Board-certified. He testified as to the significance of the laboratory data and the administration of drugs appearing in the hospital records, and of the extreme importance of the nurses' notes. He testified that, in a case of cirrhosis such as the testator's, he was particularly concerned about mental confusion as an early indication of the worsening of the patient's condition. He related the mental confusion to the level of blood ammonia which appeared in the laboratory reports and demonstrated that there was a progressive deterioration of the testator's condition. It would have been error to exclude the internist's testimony.—*In re Estate of Searchill,* 157 N.W.2d 788 (Mich., March 20, 1968)

Must Get Consent

BY THE AMA

Is it proper for a physician to discuss his patient's medical condition, disease or illness with the press?

According to the AMA Judicial Council's opinion adopted in November, 1967, a physician's obligation is to his patient.

However, a patient, by virtue of his position, may have an obligation to others such as stockholders or voters to whom he may be responsible. If such an obligation exists, the disclosure of health knowledge must come from the patient, not the physician. The physician should insure the medical accuracy of any authorized report.

In summary, it is the opinion of the Judicial Council that a physician may not discuss the patient's health condition with the press or the public without the patient's consent or, in the event of his incapacity, the family's consent.

Public Seen Accepting Fallacies About Old Age, and Believing Them; Rules for Good Health Suggested

BY PETER HOHEISEL
DETROIT

The shaking hand, tottering gait, loss of memory and mental faculties — are these the necessary consequences of old age?

Are old people necessarily more susceptible to cancer, stroke, and heart disease?

Does age 65 mark the beginning of inevitable physical and mental deterioration?

An emphatic "no" is the answer to all these questions according to the results of 10 years' work by the American Medical Association's Committee on Aging.

"The sad reality is that the American public accepts certain fallacies about old age and lives by them," says Frederick C. Swartz, M.D., a Lansing physician who heads the AMA Committee on Aging. "People think that at 65 they've over the hill and then they give up. Of course that's nonsense."

THE MAIN CONCLUSION of the AMA Committee on Aging study, as expounded by Doctor Swartz, is that there is no disease entity or physical or mental condition that results from the passage of time.

"Age does no damage to any organ," explains Doctor Swartz. "It's the use you put it to that counts. Nor does age make you more susceptible to any specific disease, he continued. I tell patients who are over 30 and complaining about getting old that what they need is conditioning; that they're getting lazy," says the Lansing physician.

"Most people do not really use their muscles, and yet vigorous physical stress is necessary for normal body functioning," he continued. "In order for exercise to be effective, it has to stretch the muscle to the fullest.

"Osteoporosis, a common complaint of older people, is as preventable as polio if people would exercise and stretch their muscles and bones. Lack of exercise is also the fundamental reason behind the many fractured bones and hips in older people."

TO PREVENT SENILITY, Doctor Swartz recommends mental as well as physical exercise. "People should read something hard each day so that their mind has to work. The old saying holds true: 'What you don't use, you lose.'

"These are some of the things people can do," concludes Doctor Swartz, "so that they can live longer, feel better, and enjoy living."

ANOTHER MAN ACTIVE in working with old people is Hazen Price, M.D., chairman of the Michigan State Medical Society Committee on Aging. Doctor Price is medical director for 500 elderly people at the Arnold Home for the Aged in Detroit.

The MSMS Committee on Aging works closely with the Michigan Society of Gerontology in

---

Peter Hoheisel is now a full-time graduate student at Wayne State University, after leaving the MSMS public relations staff in September.

physican-education programs so that doctors can know more about the environmental realities which affect an older person's health.

"For a long time physicians weren't interested in things like family situation, housing, and retirement when they treated old people," Doctor Price says. "Now we are encouraging physicians to look into these things for the total care of the individual person.

"We can't take care of a person only in respect to his heart disease; we must take a multidisciplinary approach, and the work of our Michigan State Medical Society committee has been to broaden the outlook and interest of physicians in this field.

"I would like old people to realize that even if they have a chronic disease there is always something that can be done about it, if only to make the person more comfortable with it."

WHAT ARE THE RULES for good health among older people? Doctor Price outlines three basic ones:

1) *Physical activity.* This helps the breathing, circulation, and digestion.

2) *Mental activity.* A person shouldn't think that he can't learn as he gets older.

3) *Useful work.* Inactivity breeds a lot of trouble.

With regard to useful work, Doctor Price believes that older people shouldn't just work to keep themselves occupied, but should be active in being useful to others. "When you lose your usefulness you become a fixture, not somebody important. There is nothing so rewarding as doing something for someone else."

When asked about successful adjustment to old age among the people he knows, Doctor Price replied that the key is in accepting the limitations of old age. "Those who don't accept the limitations are depressed, and never successfully adjust. Instead of doing what they can do, they brood about what they can't do."

Women, according to Doctor Price, adjust to old age better than men. He feels that this is because a woman's life has centered around the home, and with age her life style does not drastically change. Retirement for a man, however, is a radical change from what he has been doing.

THE CONCLUSION OF these Michigan experts on aging is that environment, heredity, and living habits are the main causes of the illness and deterioration, normally associated with old age, and that age 65 is no automatic sign of senility. ☐

Press Promotes Need for Doctors

Every week, Michigan newspapers voice their editorial opinions about various medical and health subjects.

Often these editorials deal with the need for physicians and often they describe efforts of the medical profession to recruit toward this same common goal.

GIFTED YOUNG PERSONS NEEDED

From The Mt. Pleasant Times-News

"There is something very special about a good doctor. In these days when so much emphasis is put on the common man and equality the instinct of survival dictates that when we get sick, we want no part of the common man.

"We want an uncommonly good doctor and good doctors are not created overnight. Moreover, it takes a person of certain aptitude and qualifications to make a good doctor.

"To hear some of the talk about how to increase the physician population, one would think that all that is necessary is to open the doors of the medical schools and herd the young people in for training.

"WHEN IT COMES to the disciplines of science, the good doctor enjoys a happy combination of a penetrating scientific mind and a compassionate consideration for his fellowman—attributes beyond the average person.

"Expanding the doctor population cannot be accomplished as rapidly as laws can be passed that create demand for medical services.

"The American Medical Association at its last annual meeting laid heavy stress on expanding medical school facilities and increasing the output of qualified medical practitioners. ". . . our resolve," states the AMA Board of Trustees, "should always be as it is now; to use the best tested and most forward looking measures to provide excellent health care for all of our citizens through an ample number of able, educated, and highly skilled physicians."

"GIFTED YOUNG PERSONS of ability will find a life of work in the medical arts highly rewarding, spiritually and materially.

"Those who enter this field should dedicate themselves to maintaining the high standards that the profession has established."

NEW MEMBERS

Members of the Michigan State Medical Society join in welcoming the following new members into a progressive state medical organization. MSMS is dedicated to promote the science and art of medicine, the protection of the public health, and the betterment of the medical profession. Each new member is encouraged to join with other MSMS members at both the local and the state levels in achieving these goals.

IN MEMORIAM

A. G. Armstrong, M.D., Detroit

A. Gordon Armstrong, M.D., Detroit physician for 43 years, died August 21 at the age of 71.

Doctor Armstrong was a member of staff at Hutzel Hospital and previously at Providence Hospital, Detroit.

Born in Ontario, Canada, he was graduated from the University of Toronto medical school in 1921. He served with the British Navy during World War I.

He was a 33rd Degree Mason and a member of the Detroit Athletic Club.

R. L. Fox, M.D., Traverse City

Richard L. Fox, M.D., Traverse City internist, died September 1, 1968. He was 36.

Doctor Fox was killed in an auto accident.

Doctor Fox received the B. S. degree from the University of Michigan and the M.D. degree from Northwestern University Medical School in 1958. Internship was at Henry Ford Hospital, Detroit, 1958-59. His residency was also done at Henry Ford Hospital, from 1959 through 1962. In 1962 he became a clinical cancer research fellow at the Detroit Institute of Cancer Research.

His practice was primarily in oncology. Hospital affiliations were with Munson Medical Center, Traverse City, and Mercy Hospital, Cadillac.

He was a member of Alpha Kappa Kappa.

L. B. Saraf, M.D., Detroit

Leo B. Saraf, M.D., Detroit surgeon, died June 28. He was 52.

Born in Sungurla in Asia Minor, Doctor Saraf received the A.B. degree from Wayne State University and the M.D. degree from Wayne State University School of Medicine in 1943. His internship was served at St. Mary's Hospital, now Detroit Memorial Hospital, and his residency at Detroit Receiving Hospital. He received formal postgraduate training in pathology at Wayne State University School of Medicine in 1943-44.

Doctor Saraf entered the private practice of general surgery in 1951. He was affiliated with St. Joseph Mercy, St. John, Receiving, Jennings and Detroit Memorial hospitals, Detroit.

He was a member of the American College of Surgeons.

Thomas Schrier, M.D., Comstock

Thomas Schrier, M.D., Comstock general practitioner, died September 6 at the age of 63.

He was affiliated with Borgess Hospital and Bronson Hospital in Kalamazoo.

Doctor Schrier received his premedical education at Kalamazoo College, Kalamazoo. He was graduated from the University of Michigan Medical School in 1931. During World War II, he served in the U. S. Army Medical Corps.

His medical fraternity was Theta Kappa Psi.

K. S. von Haitinger, M.D. Grosse Isle

Kalman S. von Haitinger, M.D., Grosse Isle psychiatrist, died in August. He was 61.

Doctor Haitinger was graduated in 1934 from the University of Louisville Medical School, Louisville, Kentucky. He received the A. B. degree from Tusculum College, Greeneville, Tennessee.

He began practice in Michigan in 1939. From 1942-46 he served in the U. S. Army Medical Corps.

He was a member of the American Psychiatric Association and of Alpha Kappa Kappa.

FOR YOUR PATIENTS:

Today's Health Guide is an up-to-date, 640-page, family health reference that should be in every home. The AMA's long awaited new book, Today's Health Guide, is the product of 200 of the world's most renowned authorities in medicine, science and allied fields.

The Guide discusses more than 2,000 illnesses, diseases and other medical subjects including diet and nutrition, child care, safety and first aid, sex education, mental health and when to seek professional medical attention. Over 300 striking illustrations and an eight-page full-color transparency of the human body vividly complement the text.

Today's Health Guide is the medical profession's answer to the need for an inexpensive yet authoritative and comprehensive home health guide.

Your patients may obtain one by sending a check or money order for $5.95 for each copy to the American Medical Association, 535 North Dearborn Street, Chicago, Illinois 60610.

This advertisement for TAO® (triacetyloleandomycin), published at the request of the Food and Drug Administration, replaces a recent one which the FDA regards as misleading.

The advertisement headlined "new evidence for TAO . . ." and emphasized that the drug is "for the frequently seen respiratory infection in the office and for a problem pathogen* in the hospital. *Staphylococcus aureus."

We emphasize that triacetyloleandomycin is to be used only for acute, severe bacterial infections where adequate sensitivity testing has demonstrated susceptibility to this drug and resistance to other less toxic agents. In view of the possible, but reversible, jaundice and hepatotoxicity of this drug, other less toxic agents should be used unless the organism is resistant to those agents, or in those cases where hypersensitivity precludes their use.

TAO is contraindicated in preexisting liver disease or dysfunction, and in individuals who have shown hypersensitivity to the drug.

The advertisement emphasized that no tooth staining has been reported after ten years of use of this antibiotic. The Food and Drug Administration regards this claim as an implied comparison suggesting that triacetyloleandomycin and tetracycline have a similar antibacterial spectrum of effectiveness, and that TAO has less toxic potential. Any such implication is not intended and, of course, would be invalid.

The advertisement referred to a research study in which patients were given triacetyloleandomycin prior to determining the susceptibility of the offending organism. Any suggestion that triacetyloleandomycin be used clinically without first determining susceptibility of the offending organism should be disregarded.

TAO®(triacetyloleandomycin)
Brief Summary

INDICATIONS: Include streptococci, staphylococci, pneumococci and gonococci. Recommended for acute, severe infections where adequate sensitivity testing has demonstrated susceptibility to this antibiotic and resistance to less toxic agents.

CONTRAINDICATIONS: Contraindicated in pre-existing liver disease or dysfunction, and in individuals hypersensitive to the drug.

PRECAUTIONS: CAUTION: USE OF THIS DRUG MAY PRODUCE ALTERATIONS IN LIVER FUNCTION TESTS AND JAUNDICE. CLINICAL EXPERIENCE AVAILABLE THUS FAR INDICATES THAT THESE LIVER CHANGES WERE REVERSIBLE FOLLOWING DISCONTINUATION OF THE DRUG.

Not recommended for prophylaxis or in the treatment of infectious processes, which may require more than ten days continuous therapy. In view of the possible hepatotoxicity of this drug when therapy beyond ten days proves necessary, other less toxic agents should be used. If clinical judgment dictates continuation of therapy for longer periods, serial monitoring of liver profile is recommended, and the drug should be discontinued at the first evidence of any form of liver abnormality. When treating gonorrhea in which lesions of primary or secondary syphilis are suspected, proper diagnostic procedures, including dark-field examinations, should be followed. In other cases in which concomitant syphilis is suspected, monthly serological tests should be made for at least four months. When used in streptococcal infections, therapy should be continued for ten days to prevent the development of rheumatic fever or glomerulonephritis. The use of antibiotics may occasionally permit overgrowth of nonsusceptible organisms. A resistant infection or superinfection requires reevaluation of the patient's therapy. In the event such occurs with this drug the medication should be discontinued, and specific antibacterial and supportive therapy instituted.

ADVERSE REACTIONS: Although reactions of an allergic nature are infrequent and seldom severe, those of the anaphylactoid type have occurred on rare occasions.

Another step forward in Ultrasonics The Burdick UT/420 Continuous or Pulsed Ultrasound

Burdick introduces its newly designed UT/420 Ultrasound! Handsomely styled, the new UT/420 produces a combination of thermal, mechanical, and chemical effects in tissue not possible with any other modality. Selection of continuous or pulsed energy offers flexibility of treatment—pulsed ultrasound permits increased mechanical effects at higher intensities without pain.
Ask your Burdick dealer about the UT/420 (he has an Ultrasound Dosage Chart for you as an aid to more effective treatment)—or write us.

Tegretol®
carbamazepine

Therapeutic breakthrough in non-narcotic control of the pain of trigeminal neuralgia

Warning
Fatal cases of aplastic anemia have been reported following treatment with Tegretol. Agranulocytosis, thrombocytopenia and transitory leukopenia have also been observed.
Complete blood and platelet counts should be done prior to and at regular intervals during treatment with the drug (see recommendations under "Important Note and Precautions") to help in the early detection of serious bone marrow injury. Abnormalities in initial blood tests should rule out use of the drug. Also, patients should be made aware of such early toxic signs of a potential hematologic problem as fever, sore throat, mouth ulcers, easy bruising and petechial or purpuric hemorrhage. Should such signs appear, the patient should be advised to discontinue the drug and to report to the physician immediately.

Indication Tegretol is indicated in the treatment of the pain associated with true trigeminal neuralgia. It is not a simple analgesic and should never be administered for relief of trivial facial aches or pains.
Contraindication Do not use in those with a known sensitivity to any tricyclic compound or in those being treated with M.A.O.I. agents. As long a period as possible should elapse before using Tegretol in patients who have been treated with M.A.O.I.'s, with a minimum of 7 days. In such cases, initial dosage should be low and the patient's reaction to gradual increments closely observed.
Important Note and Precautions Familiarity with the clinical symptoms which lead to an accurate diagnosis of true trigeminal neuralgia and with the complete prescribing information, careful patient selection, a thorough examination before treatment and close patient supervision throughout the treatment period are essential to the safe and effective use of this drug.
Where feasible, Tegretol should not be used in conjunction with any potent drug which may increase the possibility of toxic reactions.
In pregnancy, the drug should not be prescribed during the first trimester and thereafter only to patients in whom the clinical situation warrants the potential risk. It should not be administered to nursing mothers.
Patients with increased intraocular pressure should be closely observed during treatment with this drug because of its anticholinergic effect.
Because of the drug's relationship to other tricyclic compounds, the possibility of activation of latent psychosis and, in the elderly, of confusion or agitation, should be considered.
Dizziness and drowsiness may occur and patients should be cautioned about the hazards of operating machinery or automobiles and of engaging in other hazardous tasks.
Use cautiously in patients with a history of coronary artery disease, organic heart disease, congestive failure or liver disease.
Before initiating therapy, the following laboratory procedures should be performed:
1. Complete blood and platelet counts which, if abnormal, should rule out the use of the drug.
2. Baseline evaluations of liver function.
During treatment with Tegretol, the following laboratory procedures should be performed:
1. Complete blood and platelet counts should be done at intervals of one week during the first month of drug treatment, every two weeks during the second and third months, and at monthly intervals thereafter for as long as the patient is taking the drug. A trend toward a decreasing white blood cell count should suggest a dosage reduction and more frequent
laboratory and clinical evaluations. Should this trend continue, the
should be discontinued.
2. Liver function tests must be performed at regular intervals during
ment with this drug since liver damage may occur during therapy. T
drug should be discontinued immediately in cases of aggravated li
dysfunction or active liver disease.
3. Periodic eye examinations, including slit-lamp, funduscopy and to
etry, are recommended for patients being treated with this drug sin
many phenothiazines and related drugs have been shown to cause
changes.
4. Complete urinalysis and BUN should be done on patients treate
Tegretol because of observed renal dysfunction.
Adverse Reactions Dizziness, drowsiness, unsteadiness on the feet
nausea, vomiting, aplastic anemia, transitory leukopenia, agranuloc
eosinophilia, leukocytosis, thrombocytopenia, purpura, abnormalitie
liver function tests, cholestatic and hepatocellular jaundice, urinary
quency, acute urinary retention, oliguria with elevated blood pressu
albuminuria, glycosuria, elevated BUN, microscopic deposits in the
impotence, disturbances of coordination, confusion, headache, fatig
blurred vision, transient diplopia and oculomotor disturbances, spe
disturbances, abnormal involuntary movements, peripheral neuritis
paresthesias, depression with agitation, talkativeness, nystagmus, ti
nitus, paralysis and other symptoms of cerebral arterial insufficienc
pruritic and erythematous rashes, urticaria, Stevens-Johnson syndr
photosensitivity reactions, alterations in skin pigmentation, exfoliati
dermatitis, alopecia, diaphoresis, recurrence of thrombophlebitis, e
multiforme and nodosum, aggravation of disseminated lupus erythe
tosus, gastric distress, abdominal pain, diarrhea, constipation, ano
dryness of the mouth and pharynx, glossitis, stomatitis, fever, chills,
adenopathy, lymphadenopathy, aching joints and muscles, leg cra
conjunctivitis, left ventricular failure, aggravation of hypertension, h
tension, syncope and collapse, edema, aggravation of coronary arte
disease and congestive heart failure. (Whether these cardiovascula
are drug-related is not known. However, some of these complicatio
resulted in fatalities.) The necessity for discontinuing the drug shou
dictated by the gravity and severity of the adverse reactions.
Dosage and Administration The drug should always be taken with r
if possible.
Initial: One-half tablet (100 mg.) b.i.d. on the first day. Thereafter, th
should be increased in one-half tablet (100 mg.) increments every 1
until freedom from pain is achieved. To relieve pain, between 200 m
1200 mg. per 24 hours may be necessary.
Maintenance: Initial control of pain can be maintained in most patie
with a dose of 400 mg. to 800 mg. daily. Maintenance doses may ra
between 200 mg. and 1200 mg. daily.
At least once every 3 months during treatment period attempts shou
made to discontinue the drug or to reduce the dose to the minimum
effective level.
Availability Round, white, single-scored tablets of 200 mg. in bottl
of 100 and 1000.

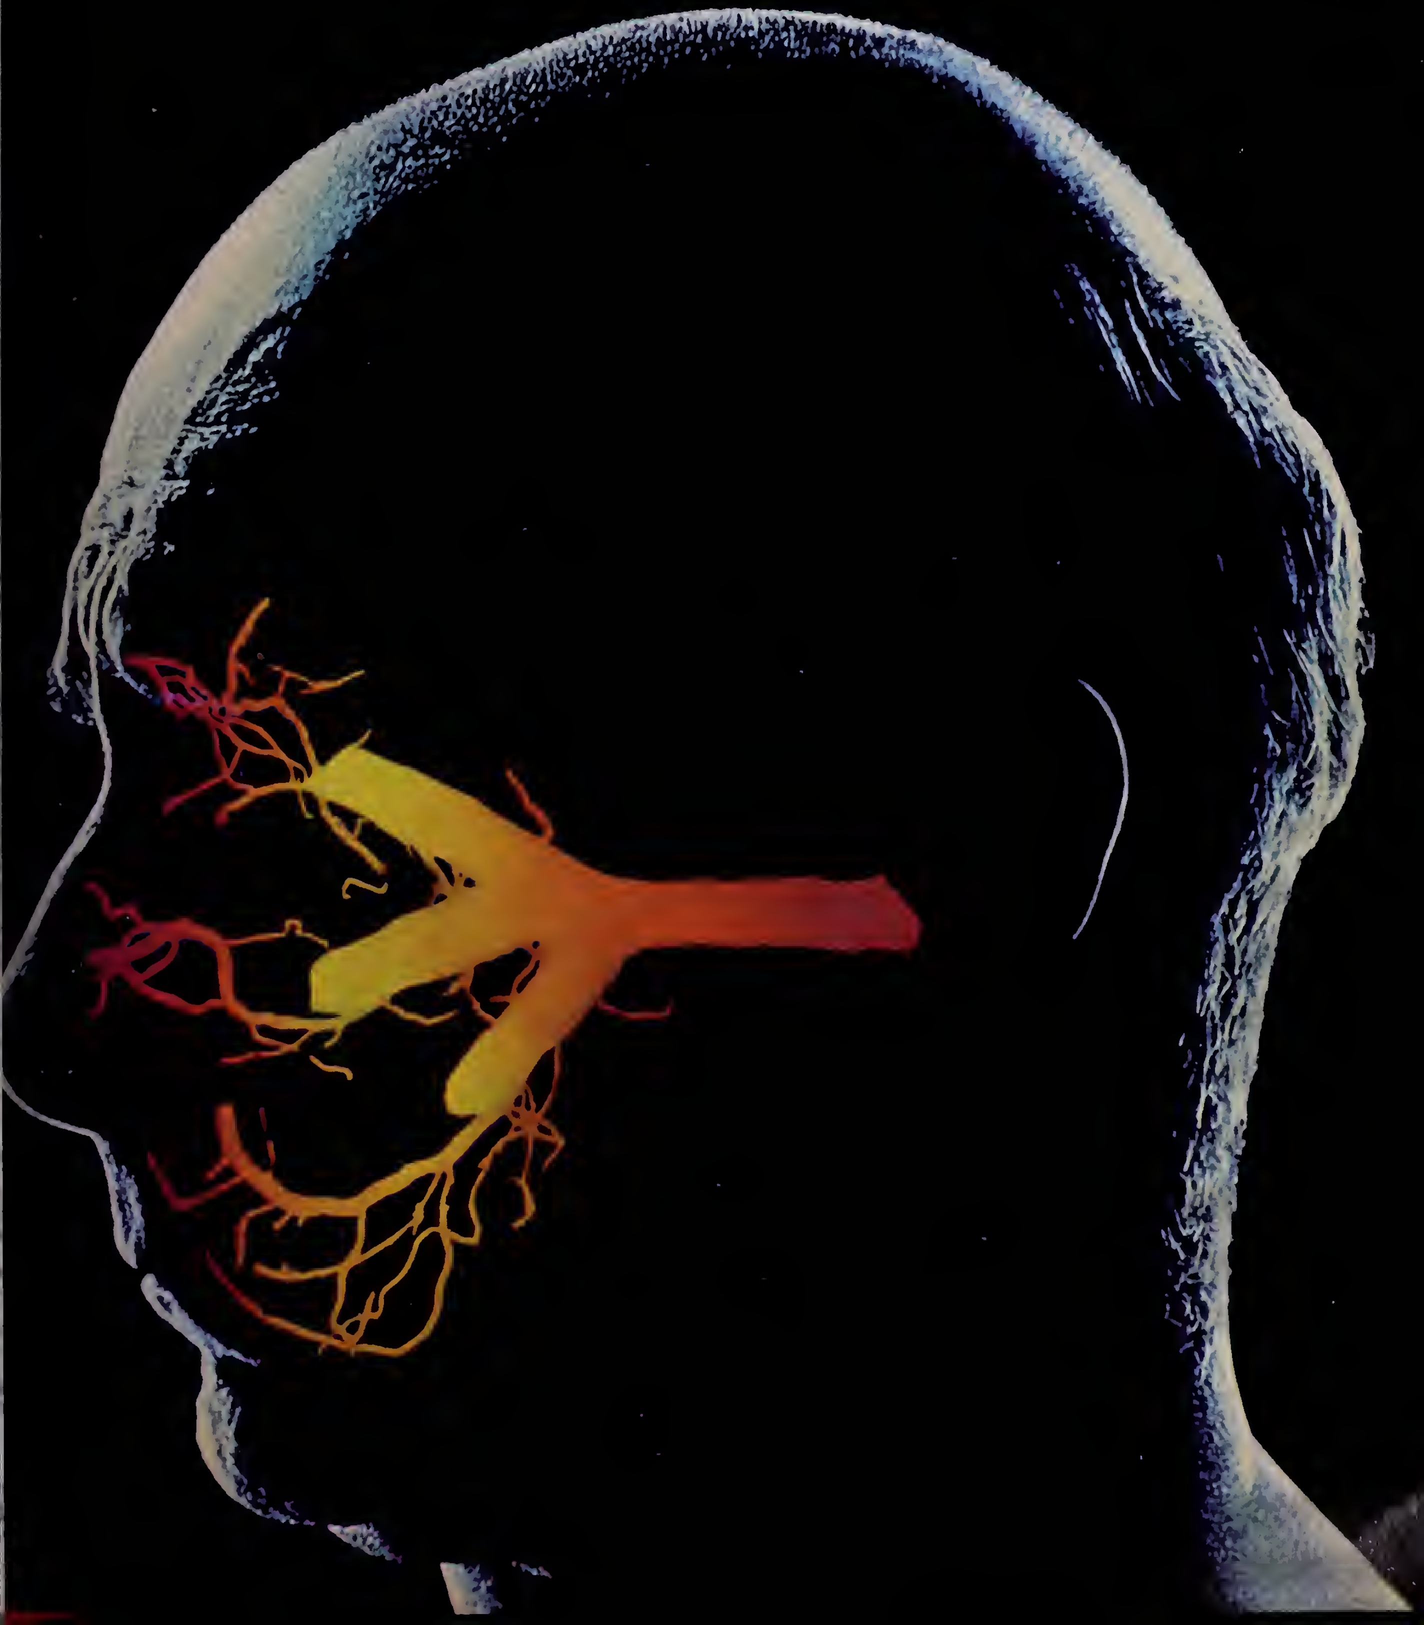
Gei

uncommon relief of uncommon pain



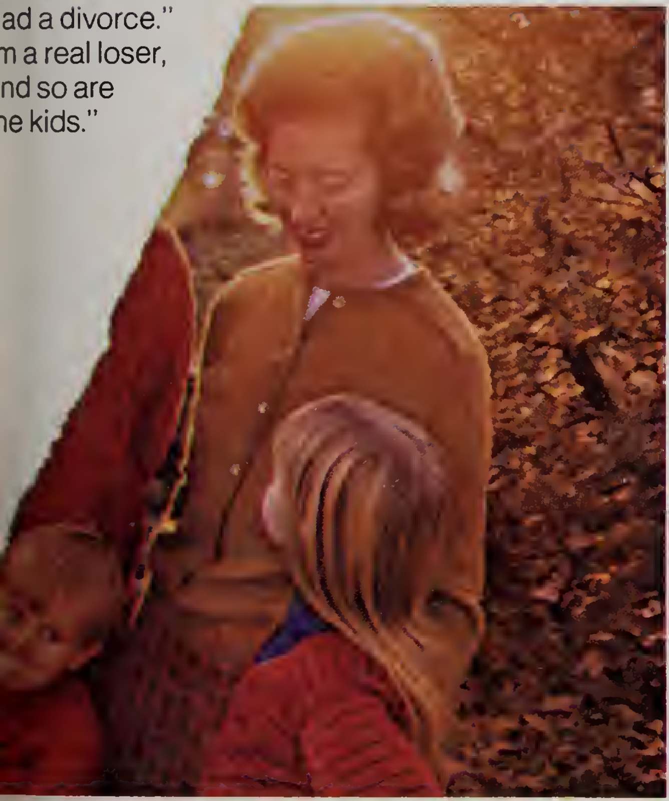
The Divorced Depressive: “Forty Forgotte

“Had a large wedding.”
“Had a fine home and family.”

TO-5757

.Forlorn"

ad a divorce."
m a real loser,
nd so are
e kids."



The loss of marital compatibility results in nearly 500,000 U.S. divorces each year.

Depression characterized by untold guilt feelings, grief and loneliness may follow.

When you diagnose depression, Tofrānil may be indicated for relief.

As maintenance therapy during the active phase of depression, Tofrānil can often help prevent relapse.

The use of Tofrānil in patients receiving M.A.O.I.'s is contraindicated. In patients with cardiovascular disease, thyroid disorders, increased intraocular pressure; in those receiving anticholinergics (including antiparkinsonism agents), thyroid medication or antihypertensive adrenergic neuron-blocking agents; and in those in their first trimester of pregnancy – the special precautions listed in the Prescribing Information should be carefully observed.

Toxic reactions severe enough to require discontinuation of Tofrānil are uncommon. However, for complete details, please refer to the complete Prescribing Information.

Turn page for brief summary of Prescribing Information.

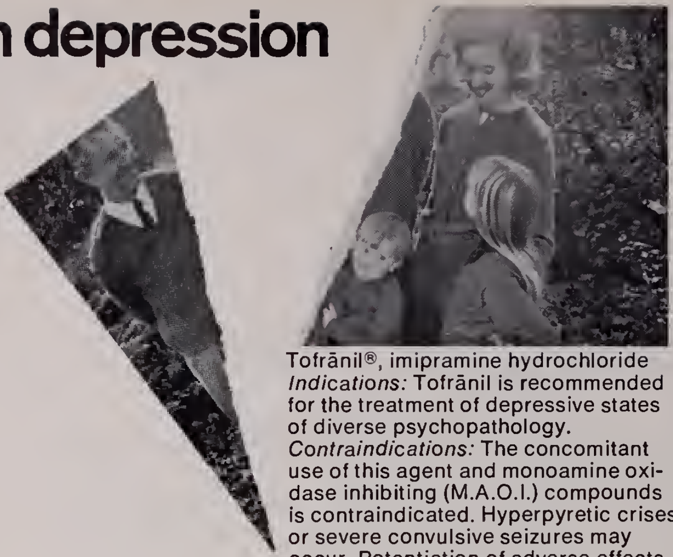
in depression **Tofrānil®** imipramine hydrochloride

Geigy

in depression

Tofrānil® Geigy

imipramine
hydrochloride



Tofrānil®, imipramine hydrochloride
Indications: Tofrānil is recommended for the treatment of depressive states of diverse psychopathology.
Contraindications: The concomitant use of this agent and monoamine oxidase inhibiting (M.A.O.I.) compounds is contraindicated. Hyperpyretic crises or severe convulsive seizures may occur. Potentiation of adverse effects can be serious or even fatal. An interval of at least 7 days after M.A.O.I. therapy has been discontinued should be allowed before this drug may be substituted. Initial dosage should be low, increases should be gradual, and the patient's progress should be carefully observed.
Warning: Clinical reports have suggested that there may be a risk of teratogenesis associated with the use of this compound during the first trimester of pregnancy. Unless, in the opinion of the prescribing physician, the potential benefits outweigh the possible risks, it should not be used during the first trimester of pregnancy.
Cardiovascular complications, including myocardial infarction and arrhythmias, have occasionally occurred in susceptible individuals. Patients with cardiovascular disease should be given the drug only under careful observation and in low dosage.
Precautions: Since suicide is always a possibility in severely depressed patients and one which may persist until significant remission occurs, such patients should be carefully supervised during early treatment. Some severely depressed patients may also require hospitalization and/or concomitant electroconvulsive therapy.
Because of its anticholinergic effect, caution should be observed in prescribing the drug for patients with increased intraocular pressure.
In rare instances, transient cardiac arrhythmias have occurred in hyperthyroid patients and in patients receiving thyroid medication when this compound was added to the regimen. Imipramine may block the pharmacologic activity of guanethidine and other related adrenergic neuron-blocking agents.
The drug is not recommended at the present time in patients under 12 years of age.
Adverse Reactions: Dryness of the mouth, tachycardia, constipation, disturbances of accommodation, sweating, dizziness, weight gain, urinary frequency or retention, nausea and vomiting, peripheral neuritis, mild parkinson-like syndrome, tremors, rare cases of falling in elderly patients, confusional states (with such symptoms as hallucinations and disorientation), activation of psychosis in schizophrenics and agitation (including hypomanic and manic episodes) which may require dosage reduction and/or addition of a tranquilizer or temporary discontinuation of the drug, epileptiform seizures, orthostatic hypotension and substantial blood pressure fall in hypertensive patients, purpura, transient jaundice, bone marrow depression including agranulocytosis, sensitization and skin rash including photosensitization, eosinophilia, and mild withdrawal symptoms on sudden discontinuation after prolonged treatment with high doses. Occasional hormonal effects (impotence, decreased libido, and estrogenic effects) may be observed. Atropine-like effects may be more pronounced (e.g. paralytic ileus) in susceptible patients and in those using anticholinergic agents (including antiparkinsonism drugs).
Outpatient Adult Dosage: Initially, 75 mg. daily, increased, if necessary, to 150 or 200 mg. Maintenance dosage may be lower, 50 to 150 mg. daily, if possible.
Geriatric and Adolescent Dosage: Initially, 30 or 40 mg. daily, which may be increased according to response and tolerance. It is usually unnecessary to exceed 100 mg. daily.
A lag in therapeutic response, lasting from a few days to a few weeks, should be expected. When dosage recommendations are already being followed, increasing the dosage does not normally shorten this latency period and may increase the incidence of adverse reactions.
Availability: Round tablets of 25 and 50 mg.; triangular tablets of 10 mg. for geriatric and adolescent use; and ampuls, each containing 25 mg. in 2 cc. for I.M. administration.

"Upper respiratory infection! I thought everything was a 'virus' these days?"

Say you saw it in Michigan Medicine

Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® in two different tablet formulations.

And let you control the dosage.

With Novahistine LP tablets and Novahistine Singlet™ tablets you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient.

Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever.

Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.

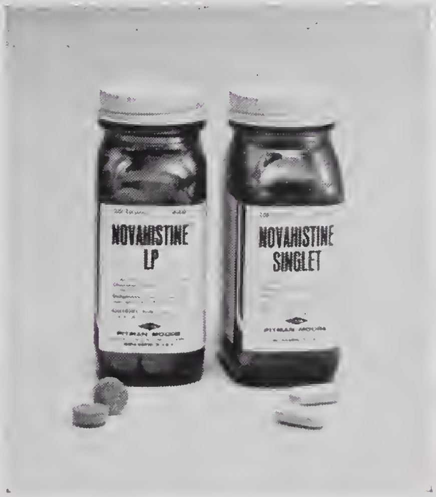
Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.

Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg.; and chlorpheniramine maleate, 4 mg.

Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

DOW **PITMAN-MOORE** DIVISION OF THE DOW CHEMICAL COMPANY, INDIANAPOLIS



An anorectic will help her lose weight– but can she keep it off? You need more than a pill (even ours) to do that!

That's why Abbott offers you a pill plus a program.

ABBOTT

For smooth appetite ontrol plus mood levation

DESOXYN® Gradumet®

Methamphetamine Hydrochloride
in Long-Release Dose Form

5 mg.
10 mg.
15 mg.

For patients who can't ake plain amphetamine

DESBUTAL® 10 Gradumet

10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet

15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

The Program

Veight Control Booklet

Specifically written to help your patients understand why they are overweight, and what they can do about it. The booklet stresses the importance of *changing lifelong eating habits* and explains how this can be done, sensibly, comfortably—and permanently. There is, also, a comprehensive list of foods showing their caloric content.

the
secret
of
controlling
your weight

Food Diary

Designed to help the overweight patient follow your eating instructions. Space is provided for breakfast, lunch, supper, and even snacks. By writing down everything that's eaten each day, the patient is constantly reminded that she's trying to change her eating habits. And you are furnished with a written record of how well she's doing.

Picture Menu Booklet

A large (10″ x 10″) booklet which features appetizing lunch and dinner menus for every day of the week. The meals are depicted in full color and the correct portion size so that the dieter can see the amount of food that's recommended. Patients are pleasantly surprised to learn that each day's meals add up to only 1,000 calories.

Brief Summary

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

Indications: Desoxyn and Desbutal are used orally as appetite suppressants, for reduction of mild mental depression, and to help in management of psychosomatic complaints or neuroses. Desoxyn, when administered parenterally, may be used as a vasopressor agent or analeptic.

Contraindications: Methamphetamine (in Desoxyn and Desbutal) is contraindicated in patients taking a monoamine oxidase inhibitor. Do not use pentobarbital (in Desbutal) in persons hypersensitive to barbiturates.

Precautions, Side Effects: Observe caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs. Prolonged usage may lead to tolerance or psychic dependence. Careful supervision is necessary to avoid chronic intoxication and drug dependence.

Amphetamine side effects such as headache, excitement, agitation, palpitation or cardiac arrhythmia usually may be controlled by reducing the dose. Paradoxically-induced depression is an indication to withdraw the drug. Pentobarbital (in Desbutal) may cause skin rash. Nervousness or excessive sedation with Desbutal is often transient.

on NCME TV…

TMANN ARCHIVE

he first nationwide medical
levision service, NCME—The
etwork for Continuing Medical
ducation—brings you visually the
nportant achievements of leading
edical authorities. By means of
osed-circuit television, this inde-
endent network provides your
ospital or medical school with a
omplete videotape service that
elps shorten the gap between new
edical knowledge and its availabil-
y for clinical or teaching purposes.

NC
ME

The Network
for Continuing
Medical
Education

NCME TV Offers These Practical Benefits:

☐ Every two weeks a new 60-minute videotape dealing with three separate medical subjects is sent to participating institutions.

☐ Content and format of NCME telecasts fulfill criteria for postgraduate medical education, permitting American Academy of General Practice course credits under specified conditions.

☐ To help your institution make effective use of closed-circuit television, NCME offers a wide range of services and utilization aids, including: Technical consultation in setting up a closed-circuit system; advance program information on the contents of each telecast; display units to help publicize programs; expense-paid seminars to improve utilization of medical television.

☐ NCME programs are brief and may be shown as often as desired; you can view the telecasts at times that are most convenient, without disrupting your normal schedule.

☐ Frequently NCME makes available published papers related to subjects presented on closed-circuit television.

A recent NCME hospital telecast presented Philip N. Sawyer, M.D., Professor of Surgery and Head of the Vascular Surgical Service at Downstate Medical Center, Brooklyn, N.Y., in a demonstration and evaluation of "Gas Endarterectomy."

In this program, Dr. Sawyer performs the operation on a patient with gross occlusion of the right iliac, femoral and popliteal arteries.

In Dr. Sawyer's view, gas endarterectomy has several advantages over mechanical methods: the operation can be completed faster, causes less damage to the arteries and offers a more successful outcome.

NCME is an independent network supported by Roche Laboratories to increase the use of closed-circuit TV for medical education under direct hospital and school control.

If your hospital or school does not participate in the biweekly NCME program, information on the cost-free service may be obtained by writing to
NCME, 342 Madison Avenue
New York, N.Y. 10017

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.

Contraindications: Glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal or bladder neck obstruction.

Precautions: Use cautiously in the presence of hypertension, hyperthyroidism, coronary artery disease; warn vehicle or machine operators of possible drowsiness.

Usage in Pregnancy: Use in pregnancy, nursing mothers and women who might bear children only when potential benefits have been weighed against possible hazards.

Note: The iodine in isopropamide iodide may alter PBI test results and will suppress I^{131} uptake; discontinue 'Ornade' one week before these tests.

Adverse Reactions: Drowsiness; excessive dryness of nose, throat or mouth; nervousness; insomnia. Other known possible adverse reactions of the individual ingredients: nausea, vomiting, diarrhea, rash, dizziness, fatigue, tightness of chest, abdominal pain, irritability, tachycardia, headache, incoordination, tremor, difficulty in urination. Thrombocytopenia, leukopenia and convulsions have been reported.

Supplied: Bottles of 50 capsules.

He's had enough excitement for one day.

For the patient who has been through an accident, the worry and anxiety following the experience may actually heighten the perception of pain. This is why there's a classic ¼ grain *sedative* dose of phenobarbital in Phenaphen with Codeine—*to take the nervous "edge" off,* so the rest of the formula can control the pain more effectively.

Phenaphen® with Codeine

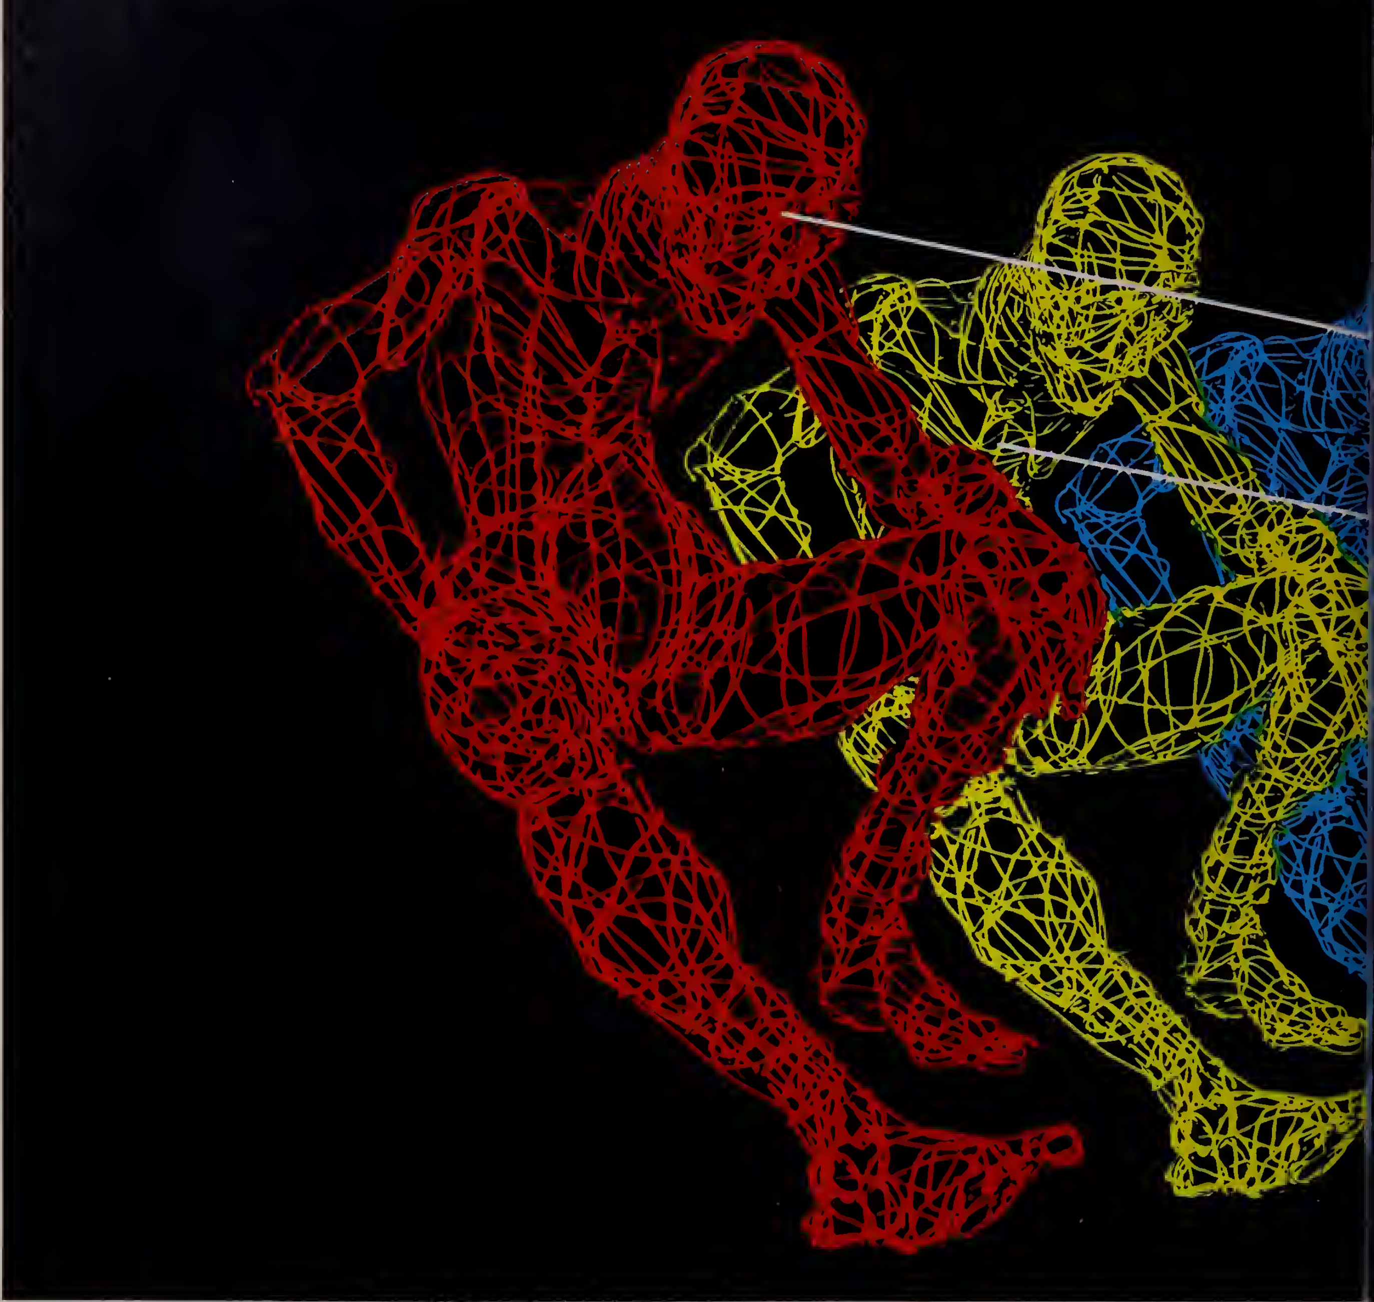
Phenaphen® with Codeine No. 2, No. 3, or No. 4 contains: *Phenobarbital* (¼ gr.), 16.2 mg. (Warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg.; Phenacetin (3 gr.), 194.0 mg.; Hyoscyamine sulfate, 0.031 mg.; Codeine Phosphate, ¼ gr. (No. 2), ½ gr. (No. 3), or 1 gr. (No. 4). (Warning: may be habit forming).

THE COMPOUND ANALGESIC THAT CALMS INSTEAD OF CAFFEINATES

Indications: Phenaphen with Codeine provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** 1 or 2 capsules at 2 to 4 hour intervals, or as directed by physician. For further details see product literature.

A. H. ROBINS COMPANY
RICHMOND, VA. 23220 A-H-ROBINS

a comprehensive hematinic



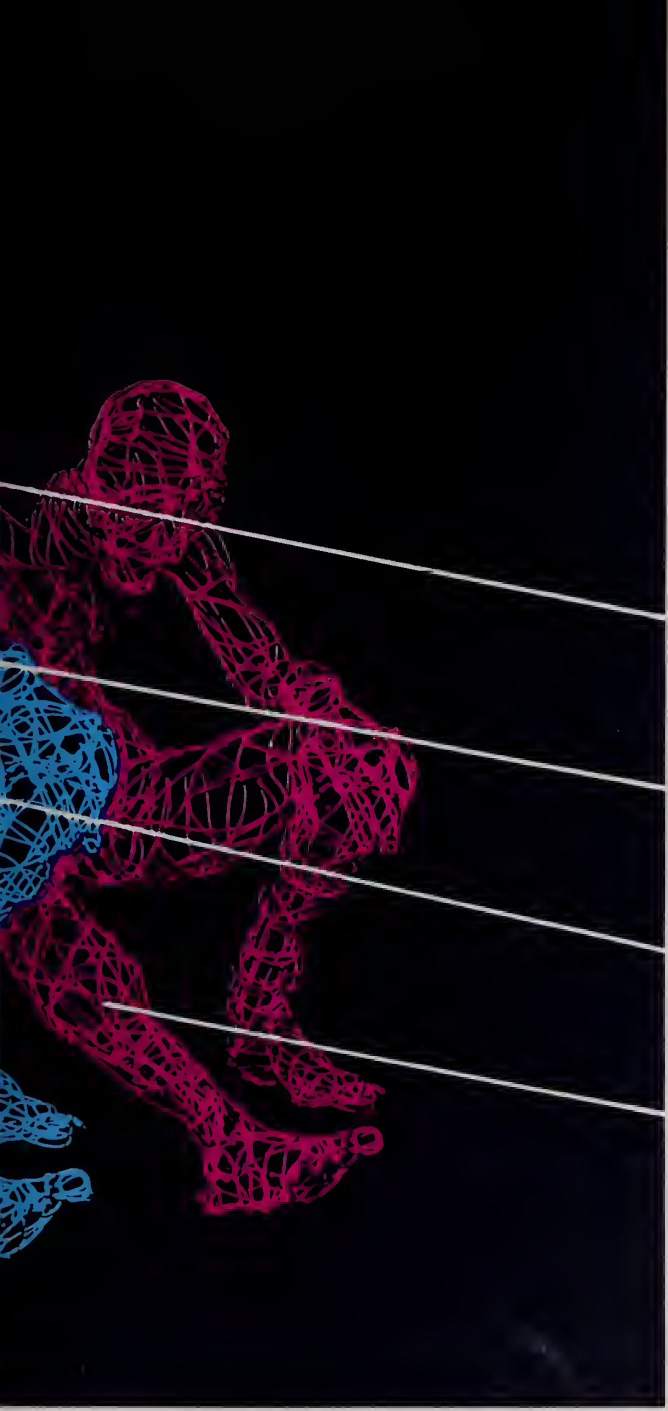
Description: Each Pulvule® contains—

Special Liver-Stomach Concentrate, Lilly (containing Intrinsic Factor)	150 mg.
Cobalamin Concentrate, N.F., equivalent to Cobalamin	7.5 mcg.
(The total vitamin B_{12} activity in the Special Liver-Stomach Concentrate, Lilly, and the Cobalamin Concentrate, N.F., is 15 micrograms.)	
Iron, Elemental (as Ferrous Fumarate)	110 mg.
Ascorbic Acid (Vitamin C)	75 mg.
Folic Acid	1 mg.

Indications: Trinsicon® (hematinic concentrate with intrinsic factor, Lilly) is a multifactor preparation effective in the treatment of anemias that respond to oral hematinics, including pernicious anemia and other megaloblastic anemias and also iron-deficiency anemia.

Contraindications: Hemochromatosis and hemosiderosis.

Precautions: Anemia is a manifestation that requires approp
investigation to determine its cause or causes.
In pernicious anemia, the use of folic acid without adec
vitamin B_{12} therapy may result in hematologic remission but
rological progression. Adequate doses of vitamin B_{12} (paren
or oral with potent intrinsic factor as in Trinsicon® [hema
concentrate with intrinsic factor, Lilly]) usually prevent, ha
improve the neurological changes.
As with all preparations containing intrinsic factor, resist
may develop in some cases of pernicious anemia to the pote
tion of absorption of physiological doses of vitamin B_{12}. If r
ance occurs, parenteral therapy, or oral therapy with so-c
massive doses of vitamin B_{12}, may be necessary. No single
men fits all cases, and the status of the patient observe
follow-up is the final criterion for adequacy of therapy. Per



You can treat combined deficiencies with

Trinsicon®

—the multifactor hematinic

Vitamin B_{12} plus intrinsic factor (15 mcg. B_{12} activity)—helps provide adequate levels of this important vitamin.

Folic acid (1 mg.)—treats nutritional macrocytic anemias and/or malabsorption syndromes.

Ascorbic acid (75 mg.)—augments the conversion of folic acid to its active form and helps iron absorption.

Iron (110 mg.)—treats hypochromic anemia.

clinical and laboratory studies are considered essential and are recommended.

Adverse Reactions: In rare instances, iron in therapeutic doses produces gastro-intestinal reactions, such as diarrhea or constipation. Reducing the dose and administering it with meals will minimize these effects.

In extremely rare instances, skin rash suggesting allergy has ollowed oral administration of liver-stomach material. Instances of apparent allergic sensitization have also been reported after oral administration of folic acid.

Dosage: One Pulvule twice a day. (Two Pulvules daily produce a standard response in the average uncomplicated case of pernicious anemia.)

How Supplied: Pulvules Trinsicon® (hematinic concentrate with ntrinsic factor, Lilly), in bottles of 60 and 500. [032568]

...a checklist for updating your ECG

If you bought your present cardiograph several years ago, are you aware of the many improvements that have been designed into new ECG equipment for greater reliability and diagnostic accuracy?

- √ High frequency response for diagnostically accurate tracings
- √ Dependable, trouble-free service
- √ Adaptable for auxiliary use, such as phone transmission of ECG's, heart sound recording, recording Achilles tendon reflex to determine patient's thyroid dysfunction
- √ One-half, standard, and double standardization on all leads
- √ Fast switching from lead to lead — 25 or 50mm. recording speeds
- √ Ease of operation; light weight; attractive styling

Take another close look at your ECG. Does it give you these important advantages? Ask your Burdick dealer to demonstrate the EK 4 — it's an excellent investment for your practice or department.

When it's more than a bad cold

your patient can feel better while he's getting better

Achrocidin®

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.;
Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen citrate 25 mg.

In tetracycline-sensitive bacterial infection complicating respiratory allergy, ACHROCIDIN brings the treatment together in a single prescription—prompt relief of headache and congestion together with effective control of the organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN (Tetracycline) equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity* reactions—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

Lederle
348-8

Sources of Sinus Headache

Sinus headache is often a reflection of congestion in the nasal mucosa. The pain that results in the various regions of the head may help in determining the particular structure(s) responsible. The proved formula of Sinutab which provides triple action — analgesic, decongestant and antihistaminic — is specifically designed for the symptomatic relief of sinus headache and nasal congestion.

INDICATIONS: Sinutab is indicated for the symptomatic relief of headache, facial pain, malaise, fever, nasal and sinus congestion often associated with acute and chronic sinusitis, allergic rhinitis, vasomotor rhinitis, influenza, and the common cold.

ADVERSE REACTIONS: Epigastric distress, drowsiness, dizziness, insomnia and nervousness.

PRECAUTIONS: Instruct patients not to drive or operate machinery if drowsiness occurs. Use with caution in patients with thyroid disease, heart disease, hypertension, diabetes or kidney disease. Excessive dosage or prolonged use may cause kidney damage.

DOSAGE: Adults — 2 tablets every 4 hours.
Children (6-12 years) — ½ the adult dose.

Each tablet contains 150 mg. acetaminophen, 150 mg. phenacetin, 25 mg. phenylpropanolamine HCl, and 22 mg. phenyltoloxamine citrate.

Source of Symptomatic Relief

Sinutab® | 2 tabs. q.4 h.

painful night leg cramps...
respond to specific therapy with
QUINAMM™
(Quinine sulfate, 260 mg.,
Aminophylline, 195 mg.)

The Bettman Archive

Just one tablet at bedtime • Prevents painful night leg cramps • Permits restful sleep

How many of your patients stamp their feet at night and lose sleep because of painful leg cramps? Unless prompted, they usually fail to report this distressing condition and suffer needlessly.

One tablet of QUINAMM at bedtime usually controls distressing night cramps and permits restful sleep with the initial dose.

Prescribing information—Composition: Each white, beveled, compressed tablet contains: Quinine sulfate, 260 mg., Aminophylline, 195 mg. **Indications:** For the prevention and treatment of nocturnal and recumbency leg muscle cramps, including those associated with arthritis, diabetes, varicose veins, thrombophlebitis, arteriosclerosis and static foot deformities. **Contraindications:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Side Effects/Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets.

Michigan State Medical Society

MSMS Members In The News

BY CAROL MAXWELL
OF THE MSMS STAFF

F. A. Nick, M.D., Ypsilanti,
has been selected team physician for the Olympic team for Iran. The Olympic Games in Mexico City will not be the first he has attended, as Doctor Nick was himself once a member of the Iranian team. A six-time national boxing champion of Iran, he competed as a bantamweight in the 1952 Games in Helsinki, Finland. Former ringside physician in the Florida Golden Gloves while serving his residency in Jacksonville, he now is a member of the Washtenaw County Medical Society's committee on athletics and of the American College of Sports Medicine.

Lynn D. Allen, M.D., Pontiac,
recently was reappointed by the Pontiac City Council to the Pontiac General Hospital Board of Directors. He was first appointed 10 years ago.

Donald H. Kaump, M.D., Ann Arbor,
has been promoted to director of the new Parke-Davis department of pathology and toxicology and will also serve as acting director of the department of experimental therapeutics. He is a special lecturer in pathology at the University of Michigan Medical School.

Edward F. Crippen, M.D., Detroit,
formerly of Mancelona and more recently Deputy Commissioner of Health for the City of Detroit, has begun his new duties as Nevada State Health Officer in Carson City.

Arthur C. Curtis, M.D., Ann Arbor,
will address the annual leadership conference of the American Social Health Association in New York City Oct. 27-28 when the voluntary agency meets to consider "Venereal Disease Research Priorities: Biologic, Behavioral and Control." Doctor Curtis, professor of dermatology, University of Michigan, will speak about plans and priorities in control measures of the nongovernmental organization.

William B. Weil, Jr., M.D., East Lansing,
chairman of MSU's new Department of Human Development, has been named president-elect of the Society for Pediatric Research. He has been secretary of the society since 1962.

Vernon V. Bass, M.D., Saginaw,
Vice-Speaker of the MSMS House of Delegates, spoke to the Ottawa County Medical Society October 4 during a program exploring various possible projects and activities for county medical societies.

John J. Hanlon, M.D., Detroit,
began new duties in September as the Assistant Surgeon General in the Public Health Service in Washington. He formerly had been Commissioner of Health of the City of Detroit and head of the WSU Medical School Department of Community Medicine.

Shirley Austin, M.D., Detroit,
spoke at the MSMS pre-convention news luncheon in Detroit September 18. She discussed "Relief of Pain" for the press, radio and television reporters.

House Re-Elects Blodgett, Bass

Lightbody Installed; Mason Elected Next President; Taylor to Head Council

The leadership of MSMS today lines up with:

President: James J. Lightbody, M.D., Detroit

President-Elect: Robert J. Mason, M.D., Birmingham

Speaker: James B. Blodgett, M.D., Detroit

Vice-Speaker: Vernon V. Bass, M.D., Saginaw

Council Chairman: Ross V. Taylor, M.D., Jackson

Council Vice-Chairman: Ralph R. Cooper, M.D., Detroit

These men were installed, elected, or re-elected at the 1968 Annual Session of the MSMS House of Delegates in Detroit, along with others who were selected to serve on The MSMS Council or in the MSMS delegation to the AMA House of Delegates.

The MSMS House of Delegates, at its closing session, September 24, unanimously elected Doctor Mason as the President-Elect. He had served as Chairman of the MSMS Council for two years, and had been a member of The Council, representing Oakland-Macomb, for nine years.

At that final session, the delegates re-elected Speaker Blodgett and Vice-Speaker Bass for their second terms. The delegates praised them for their excellent handling of the 1968 business meeting. Doctor Lightbody was installed as the new President at a special Delegates Dinner September 22 to succeed B. M. Harris, M.D., who completed his year as MSMS President.

When The MSMS Council reorganized on September 24, the councilors elevated Doctor Taylor from Vice-Chairman to the Chairmanship. Doctor Cooper was elected Vice-Chairman and the Chairmen of the three Standing Committees were all re-elected—Robert K. Whiteley, M.D., Finance; John J. Coury, M.D., County Societies, and Brooker L. Masters, M.D., Publication.

Four delegates and four alternate delegates were re-elected for two-year terms in the AMA House of Delegates. All were unopposed. Returned as Delegates were Sidney Adler, M.D., Detroit; George W. Slagle, M.D., Battle Creek; Don-

(Continued on Page 1304)

The royal purple ribbon with the MSMS President's Key is placed over the head of James J. Lightbody, M.D., at the 1968 Annual Session to signify his installation as President for 1968-69. The key was passed on by B. M. Harris, M.D., who then received a Past President's Scroll from the new President.

Party Platforms on Health:

The two party conventions adopted platforms which have been explained by the candidates during the current campaign.

Following are the platform statements by each about health:

DEMOCRATIC

The best of modern medical care should be made available to every American. . . .

Through a partnership of government and private enterprise we must develop new coordinated approaches to stem the rise in medical and drug costs without lowering the quality or availability of medical care. Out-of-hospital care, comprehensive group practice arrangements, increased availability of neighborhood health centers, and the greater use of sub-professional aides can all contribute. . . .

We will raise the level of research in all fields of health. . . .

We must build new medical, dental and medical service schools, and increase the capacity of existing ones. . . .

Medical care should be extended to disabled beneficiaries under the Old Age, Survivors and Disability Insurance Act to the same extent and under the same system that such care is available to the aged. . . .

Maternal and child health centers, located and designed to serve the needs of the poor, and voluntary family planning information centers should be established throughout the country.

Medicaid programs administered by the states should have uniform standards. . . .

We urge consideration of a program comparable to Medicare to finance pre-natal care for mothers and post-natal care for children during the first year of life.

REPUBLICAN

We pledge to encourage the broadening of private health insurance plans, many of which cover hospital care only, and to review the operation of government hospital care programs in order to encourage more patients to utilize non-hospital facilities.

Expansion of the number of doctors, nurses and supporting staff . . . will have our support.

We will foster the construction of additional hospitals and encourage regional hospital and health planning. . . .

We will also press for enactment of . . . programs for financing of hospital modernization. . . .

New diagnostic methods and also preventive care to assure early detection of physical impairments . . . will have our support.

We will work with states and local communities to help assure improved services to the mentally ill within a community setting and will intensify research to develop better treatment methods. We will encourage extension of private health insurance to cover mental illness.

While believing no American should be denied adequate medical treatment, we will be diligent in protecting the traditional patient-doctor relationship. . . .

VOTE AS YOU PLEASE
BUT VOTE!

Continued: 1968 House of Delegates, Council Elects

ald N. Sweeny, Jr., M.D., Detroit, and Joseph A. Witter, M.D., Highland Park. Continuing to serve as Alternates are James C. Danforth, Jr., M.D., Detroit; John J. Coury, M.D., Port Huron; Marjorie Peebles Meyers, M.D., Detroit, and Vernon V. Bass, M.D., Saginaw.

Continuing to serve another year as Delegates are Otto K. Engelke, M.D., Ann Arbor; John R. Heidenreich, M.D., Daggett; Luther R. Leader, M.D., Royal Oak; and Robert E. Rice, M.D., Greenville; and as Alternate Delegates, Harold A. Furlong, M.D., Pontiac; B. M. Harris, M.D., Ypsilanti; Paul T. Lahti, M.D., Royal Oak; and John W. Moses, M.D., Detroit.

The delegates elected two new members of The MSMS Council. Sydney Scher, M.D., Mt. Clemens, to succeed Doctor Mason representing the 15th District; and Wm. A. LeMire, M.D., Escanaba, to succeed Eugene R. Elzinga, M.D., Marquette, who was not a candidate, representing the 12th District.

Returned to The Council were Milton R. Weed, M.D., Grosse Pointe Park, 1st District; John J. Coury, M.D., Port Huron, 7th District; A. Carl Stander, M.D., Saginaw, 8th District; and Edward H. Rodda, M.D., Bay City, 10th District.

THE PROCEEDINGS WILL BE PRINTED IN DECEMBER AS PART OF JOURNAL

Unofficial Summary of House Action

BY JAMES B. BLODGETT, M.D.
SPEAKER, HOUSE OF DELEGATES

The following summary report of the proceedings of the 103rd (1968) House of Delegates of the Michigan State Medical Society is *UNOFFICIAL.*

It is designed to assist delegates in reporting to their medical societies prior to the publication of the official stenotyped record which is printed in *Michigan Medicine,* the Society's monthly journal.

One-hundred-sixty-two Delegates and 23 Section Delegates considered 70 resolutions (a 15% increase over 1967), a 12-page comprehensive report of the past year's activities of the MSMS Council, an 11-page report plus supplement from Michigan Medical Service, the summary of activities of the 53 committees of the Society, The Council and the House of Delegates, and numerous special reports.

The following decisions of the House as the legislative body of MSMS shape the policy and course of the Michigan State Medical Society for 1968-69.

MATTERS OF GENERAL MSMS BUSINESS

The House amended the Bylaws to permit a partial waiver of MSMS dues if this action is also taken by the component county society due to the member's illness, disability or straited financial circumstances. (Resolution 13)

The House divided the Society's scientific section on Psychiatry and Neurology into separate sections on each specialty. (Resolution 14)

The House favored annual reappointment to the active medical staff of a hospital, stating that reappointment should not be denied except for medical ineptitude, character deficiency, conviction of unethical conduct, revocation of license by the State, or violation of those bylaws, rules or regulations of the hospital which have been approved by the medical staff. (Resolution 18 as amended)

The House directed that the Joint Commission on Accreditation of Hospitals be asked to require "Hospital Care Committees" in all hospitals as a condition of accreditation, composed of physician members of the staff, to review all aspects of hospital-provided (as opposed to physician-provided) patient care. (Resolution 37)

The House urged the American Medical Association to take leadership to combat crime and delinquency by studying the medical aspects of the same. (Resolution 45)

The House directed the official establishment of liaison with all Michigan Student American Medical Association groups; the House also resolved to increase financial support to all Michigan SAMA chapters. (Resolution 52)

The House requested that a program be developed to provide limited affiliate membership in local county medical societies for medical students. (Resolution 53)

The House instructed The Council of MSMS to seek a grant for the purpose of conducting a pilot study on ways and means to improve efficiency in the hospital care of patients. (Resolution 10)

The House urged all physicians to consider carrying excess professional liability (coverage at least $1,000,000) since awards in many cases far exceed the usual $100,000 coverage. A study of ways and means to reduce the cost of adequate coverage will be made and reported to the 1969

Members of the Oakland County Medical Society escort Robert J. Mason, M.D., to the rostrum of the House of Delegates after the delegates chose the Birmingham physician as President-Elect. The three men who can be identified behind Doctor Mason are Harold A. Furlong, M.D., Pontiac, who made the nominating speech; Paul T. Lahti, M.D., Royal Oak, and Richard R. Galpin, M.D., Pontiac, Oakland president.

Continued: Unofficial Summary of House Action

House. (Reference Committee on Professional Liability Insurance)

The House commended the MSMS Woman's Auxiliary for their contributions to World Medical Relief and the AMA Education Research Foundation and their general valuable aid to the State Society. (Reference Committee on Reports of Council and Officers)

The House recognized the importance of physicians' contributions to the health and welfare of humanity through counseling their patients in family planning. (Resolution 6)

The House requested a study of the problem of investigating complaints against physicians who are not members of MSMS. (Resolution 16 as amended)

The House directed that the matter of water pollution be given increased emphasis by the MSMS. (Resolution 21 as amended)

The House requested Michigan medical schools to intensify their efforts to encourage their graduates to practice in Michigan, and also asked that all appropriate lay groups (Chambers of Commerce, etc.) be encouraged to take similar action. (Resolution 38 and 69)

The House highly commended the Michigan Doctors Political Action Committee and urged every member to personally become active in MD-PAC and the political process. (Resolution 64)

The House empowered The Council to exercise its own judgment in proceeding to obtain group liability insurance. (Reference Committee on Reports of Council and Officers)

The House asked The Council to make every effort to confine the direction and supervision of medical laboratories to licensed physicians. (Resolution 56)

The House directed The Council to condemn all cigarette advertising on television, and also direct the Michigan AMA delegation to introduce a resolution in the AMA House calling for similar action by that body. (Resolution 58)

The House directed the Michigan AMA delegates to introduce a resolution in the AMA House requesting deletion of the AMA Reinstatement Fee. (Resolution 35)

MATTERS PERTAINING TO LEGISLATION AND GOVERNMENT

The House opposed a proposed revision to the Michigan Criminal Code which would make it a felony to violate the administrative rule of a state agency. (Resolution 9)

The House urged the strongest possible support of appropriate legislative action to fully develop the University of Michigan, Wayne State University, and Michigan State University medical schools (expansion of the latter to a full MD degree program). (Substitute Resolution for Resolutions 26 and 27)

The House directed introduction of a bill in the Michigan Legislature to extend the legal protection from liability now granted in Public Act 270 of 1967 to in-hospital staff committees to those county medical societies, MSMS and specialty society committees which develop confidential information to reduce morbidity or mortality or to promote medical education and research. (Resolution 31)

The House directed that MSMS support legislation which will allow minors to give their own consent for examination for and treatment of venereal disease. (Resolution 33)

The House requested that the Board of Registration in Medicine explore all means of mechanically streamlining their examination functions (computerization, etc.). (Resolution 34 as amended)

The House expressed opposition to any legislation that would in any way degrade the profession and dignity of a registered nurse or in any way equate the status of a registered nurse with persons of less training. (Resolution 42)

The House encouraged the enactment of legislation which will more strictly enforce the existing laws relative to driving while drunk and impose more severe penalties for violations thereof, detect and prosecute the reckless or careless driver, and provide for a more careful and appropriate interval examination of all drivers. (Resolution 62 as amended)

The House directed that the Michigan Department of Social Services be advised to make any necessary changes, including legislative if necessary to provide direct payment to Title 19 Group 2 patients. (Resolution 63 as amended)

The House reiterated that "in the future, payments from all governmental agencies should be on the same basis" (the usual, customary and reasonable fee) as Title 18B Medicare, and that this recommendation be forwarded to all county medical societies for use in negotiating with local governmental agencies. (Reference Committee on State and Federal Legislation)

The House directed the Michigan AMA delegation to present a resolution to the AMA House seeking to eliminate present recertification requirements for Medicare and Medicaid patients. (Substitute for Resolutions 1 and 61, Reference Committee on Health Insurance and Medical Service)

The House asked the Michigan AMA delegation to introduce a resolution in the AMA House in support of a Uniform National Medical Licensing Examination. (Resolution 15)

The House directed the Michigan delegation to urge the AMA House to strongly support increased subsidies to hospital nursing schools. (Substitute for Resolution 57 and 59, Reference Report on State and Federal Legislation)

The House referred continuing study of feasible malpractice legislation to The Council for referral to an appropriate study committee. (Resolution 2)

The House referred specific recommendations regarding Medical Examiner Legislation to The Council for referral to the committee presently working in this area. (Resolution 54)

The House directed the Speaker to review the "Single Medical Practice Act" which had been referred to it. The Speaker was directed to appoint an ad hoc committee of the House, including representative of the Board of Registration in Medicine and the Legal Affairs Committee, and included Legal Counsel, to review it. The ad hoc committee will obtain the views of each county medical society. The Council is empowered to take any necessary action in this area. (Reference Report of Reports of Council and Officers)

The House adopted a resolution and accompanying policy guidelines on therapeutic abortion both of which are to be considered together as a single document. The resolution recommends change in the Abortion Laws of Michigan, and the policy guideline sets forth the House's view of the controls which should be exercised over abortions performed by licensed MDs and DOs in licensed and accredited hospitals. The resolution reads:

> Whereas, the current abortion laws of the State of Michigan are very restrictive so that only a very few women may receive legal abortions, and
>
> Whereas, all data indicate that despite these laws many women do receive criminal abortions and in the process many times seriously endanger their physical and mental health, and
>
> Whereas, all of the current abortion law reform bills are limited in their scope so that very few women would have the right to obtain an abortion, and
>
> Whereas, the right to bear a child should be primarily determined by the woman and her husband, therefore be it
>
> RESOLVED: That the Michigan State Medical Society urge the Michigan Legislature to so alter the abortion laws that the criminal code will not apply to abortions performed by licensed medical and osteopathic physicians in an accredited hospital licensed by the State.

The policy guidelines states:

> "Therapeutic abortion is a medical procedure. Accordingly the Michigan State Medical Society recognizes this responsibility to render available scientific medical information with respect to therapeutic abortion to legislators, authorized committees, the public, and finally and most importantly patients. Nowhere in the progression of therapeutic abortion legislation or practice should sight be lost of the fundamental principle that the primary decision belongs to the patient. This decision must be based on an informed understanding of the nature and the consequences of the therapeutic abortion and should be coupled with the informed consent of the husband if any and the parents and/or legal guardian if the patient is a minor. The Michigan State Medical Society respectfully recognizes that some physicians because of moral or religious grounds oppose liberalization of the abortion laws. Therefore, no physician or hos-

MORE ARTICLES AND PHOTOS OF 1968 ANNUAL SESSION WILL APPEAR IN NOVEMBER ISSUE OF MICHIGAN MEDICINE

pital should be compelled directly or indirectly to perform a therapeutic abortion.

In view of the above, the Michigan State Medical Society believes that therapeutic abortion may be authorized subject to the following conditions:

1. A licensed medical or osteopathic physician perform the abortion in an accredited hospital licensed by the state.
2. Two other doctors of medicine or osteopathy concur in writing that one of the following conditions exist:
   a) The abortion is deemed necessary to preserve the life of the pregnant female; or
   b) The abortion is deemed necessary to preserve the physical or mental health of the pregnant female; or
   c) That the infant may be born with incapacitating physical deformity or mental deficiency; or
   d) That 3 doctors of medicine or osteopathy believe that the pregnancy resulted from forcible rape or incest.
3. MSMS does not condone the concept that an abortion be performed on demand for any unwanted pregnancy or as a means of birth control. We do not believe, however, that in determining whether or not there is a risk to the pregnant woman's life or health account must be taken of the patient's total environment considering such factors as parity, contraceptive failure, socio-economic stress, or marital or family stress when a woman does request a therapeutic abortion."

MATTERS DEALING WITH PARAMEDICAL AND ALLIED SUBJECTS

The House urged that all Michigan hospital administrative staffs inform all ancillary medical personnel not to discuss a patient's diagnosis or treatment, or the qualifications or direction of any physician or nurse, with or in the presence of the patient. (Resolution 17)

The House endorses the principle of a "balanced patient load" for nursing homes rather than the categorizing of certain homes as "basic" and others as "skilled." (Resolution 43)

The House urged the subcommittee on Para-Medical Education of the Education Liaison Committee to continue with its development of a program for the education of physician's assistants. (Resolution 48)

The House highly commended the activities of the Michigan State Assistants Society and recommended membership in MSMAS for all eligible persons. (Reference Committee on Reports of Council and Officers)

The House encouraged continuing activity of the Liaison Committee with Podiatry. (Reference Committee on State and Federal Legislation)

The House directed The Council to seek a grant to conduct a "pilot study to improve hospital efficiency." (Resolution 10)

The House referred to The Council for its further consideration the project of a study of osteopathic training programs. (Resolution 41)

The House directed The Council to ask the Health Insurance Council to explore the inclusion of out-patient physical therapy by a licensed physical therapist as a benefit in all policies. (Resolution 22 as amended)

The House asked The Council to request the State Board of Education to turn its attention to developing nursing education programs following specific guidelines as set forth in resolutions 57 and 59. (Reference Report on State and Federal Legislation)

The House directed that the Joint Commission on Accreditation of Hospitals be asked to require "Hospital Care Committees" in all hospitals as a condition of accreditation, composed of physician members of the staff, to review all aspects of hospital-provided (as opposed to physician-provided) patient care. (Resolution 37)

The House encouraged the enactment of legislation which will more strictly enforce the existing laws relative to driving while drunk and impose more severe penalties for violations thereof, detect and prosecute the reckless or careless driver, and provide for a more careful and appropriate interval examination of all drivers. (Resolution 62 as amended)

The House referred continuing study of feasible malpractice legislation to The Council for referral to an appropriate study committee. (Resolution 2)

MATTERS PERTAINING TO BLUE SHIELD AND PREPAYMENT PLANS

The House requested a Michigan Medical Service study of the possibility of making regional anesthesia administered by the attending physician a compensable benefit. (Resolution 32 as amended)

The House asked the Michigan Medical Service Board of Directors to carefully review its advertising policies relative to the MVF plan to eliminate error or confusion by doctors and subscribers. (Resolution 39 as amended)

The House recommended to Blue Shield that it annually announce to its subscribers the percentage of the premium paid to Blue Cross and the percentage to Blue Shield so that they will know the ratio between physician remuneration and defraying of hospital costs. (Resolution 49)

The House endorsed, in principle, the Michigan Variable Fee Program of Michigan Blue Shield. (Resolution 55 as amended)

The House urged Michigan Medical Service to resist to the full extent of its ability, any effort of the Secretary of Health, Education and Welfare to take over confidential records or data pertaining to Michigan physicians. (Resolution 67)

The House adopted the Michigan RVS as revised in 1968, and directed that this valuable reference for physicians be revised annually if necessary. (Reference Report on Health Insurance and Medical Service)

The House commended Michigan Medical Service for its demonstrated management efficiency in improving its ability to handle vastly expanding business operations. (Reference Report on Health Insurance and Medical Service)

The House referred to The Council, for referral to a committee for further study, the proposition of revising Blue Shield's method of payment to physicians. (Resolution 44)

The House directed the Michigan AMA delegation to present a resolution to the AMA House seeking to eliminate present recertification requirements for Medicare and Medicaid patients. (Substitute for Resolutions 1 and 61, Reference Committee on Health Insurance and Medical Service)

The House asked that every county medical society be represented by at least one physician on a "Regional Advisory Committee to Blue Shield," the regions to be councilor districts or combinations thereof, to review claims, utilization frequency and charge patterns, and arbitrate fee disputes. The members of such review committees are to report back to their county societies. (Resolution 29 as amended)

MATTERS PERTAINING TO COUNTY MEDICAL SOCIETIES

The House urged all component county medical societies and medical staffs of hospitals to conduct one meeting a year on the subject of the legal problems of medical care. (Resolution 17)

The House resolved to intensify dissemination of specific information to county medical societies regarding State Comprehensive Health Planning and the role of the county society in providing leadership for this program. (Resolution 3 as amended)

The House urged each county medical society to develop citizens groups to support Medicine's effort to bring the University of Michigan, Wayne State University and Michigan State University to full potential function in training doctors of medicine. (Reference Report on Report of Council and Officers)

The House requested each county medical society to take an active interest in training ambulance personnel and in upgrading ambulance service. (Resolution 25)

The House asked that every county medical society be represented by at least one physician on a "Regional Advisory Committee to Blue Shield," the regions to be councilor districts or combination thereof, to review claims, utilization frequency, and charge patterns, and arbitrate fee disputes. The members of such review committees are to report back to their county societies. (Resolution 29 as amended)

The House directed the Speaker to review the "Single Medical Practice Act" which had been referred to it. The Speaker was directed to appoint an ad hoc committee of the House, including representative of the Board of Registration in Medicine and the Legal Affairs Committee, and including Legal Counsel, to review it. The ad hoc committee will obtain the views of each county medical society. The Council is empowered to take any necessary action in this area. (Reference Report of Reports of Council and Officers)

The House requested that a program be developed to provide limited affiliate membership in

---

The formal presentation of Marjorie Peebles Meyers, M.D., as the "Outstanding Physician of the Year" was made by Speaker James B. Blodgett, M.D., at the Delegates Dinner. (Details of the award and the service record of Doctor Meyers appeared in the October issue of **Michigan Medicine.**)

local county medical societies for medical students. (Resolution 53)

The House reiterated that "in the future, payments from all governmental agencies should be on the same basis" (usual, customary and reasonable fee) as Title 18B Medicare, and that this recommendation be forwarded to all county medical societies for use in negotiating with local governmental agencies. (Reference Committee on State and Federal Legislation)

MATTERS PERTAINING TO COMMITTEES

The House authorized establishment of a liaison committee between MSMS and the Michigan Hospital Association. (Resolution 7)

The House requested the liaison committee between MSMS and the Michigan Bar Association to make recommendations (by September 1969) regarding the legality and advisability of a law requiring that, if it is voluntarily agreed to by both parties, arbitration in malpractice suits be binding. (Resolution 20 as amended)

The House requested the standing committee on Constitution and Bylaws to study the question of MSMS referendum by petition and the use of mail ballots (Resolution 23) and also the general subject of life memberships. (Resolution 47)

The House directed The Council to appoint an ad hoc committee to study the relationship between the various state medical societies and the medical political action committees in the states. (Resolution 60 as amended)

The House approved the making of the Committee on Professional Liability a permanent Committee of the House. (Report of Reference Committee on Public and Professional Relations)

The House directed the Speaker to appoint a committee of the House to investigate remuneration of MSMS officers and report in 1969. Reference Report on Reports of Council and Officers)

The House urged the subcommittee on Para-Medical Education of the Education Liaison Committee to continue with its development of a program for the education of physician's assistants. (Resolution 48)

A House of Delegates Reference Committee reviewed the monograph "Where We Stand" and Resolution 65 pertaining thereto, and highly commended this document as a provocative and stimulating summarization of medical positions recommending that it be studied by all delegates and society officers as a basis for constructive dialogue and future deliberations. The House asked that the monograph be revised and updated yearly.

Eight Michigan physicians who have practiced 50 years and who were honored by the House of Delegates, pause in the hallway with MSMS President B. M. Harris, M.D., at far right. The five men in the front row with Dr. Harris, left to right, are: Lloyd Harvie, M.D., Saginaw; A. M. Giddings, M.D., Battle Creek; Fred O. Lepley, M.D., Grosse Pointe Woods; Karn C. Kerwell, M.D., Stephenson; Eldon C. Baumgarten, M.D., Grosse Pointe Woods; and Doctor Harris; and in the back row, left to right, Clyde Hasley, M.D., Detroit; M. S. Hurth, M.D., Lansing; and Milton D. Vokes, M.D., Detroit. Alfred C. Whittaker, M.D., Detroit, also was present to receive his pin but was not available for this photograph.

An antibiotic should work well in either acid or alkaline urine.

It isn't always necessary to adjust urinary pH in treating G.U. infections.

Not when the causative organism is a strain sensitive to DECLOMYCIN® Demethylchlortetracycline, as is often the case.

DECLOMYCIN remains stable and active in either acid or alkaline urine. So there's no need to acidify the urine to keep the antibiotic at work.

Why match the urine to the antibiotic...when you can match the antibiotic to the urine...by prescribing DECLOMYCIN. A b.i.d. dosage makes therapy convenient for your patient.

Effectiveness: DECLOMYCIN Demethylchlortetracycline should be equally or more effective therapeutically than other tetracyclines in infections caused by organisms sensitive to the tetracyclines.

Contraindication: History of hypersensitivity to demethylchlortetracycline.

Warning: In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated, and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort. Necessary subsequent courses of treatment with tetracyclines should be carefully observed.

Precautions: Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment.

Side Effects: Gastrointestinal system — anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. Skin — maculopapular and erythematous rashes; a rare case of exfoliative dermatitis has been reported. Photosensitivity; onycholysis and discoloration of the nails (rare). Kidney — rise in BUN, apparently dose-related. Transient increase in urinary output, sometimes accompanied by thirst (rare). Hypersensitivity reactions—urticaria, angioneurotic edema, anaphylaxis. Teeth — dental staining (yellow-brown) in children of mothers given this drug during the latter half of pregnancy, and in children given the drug during the neonatal period, infancy and early childhood. Enamel hypoplasia has been seen in a few children. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Demethylchlortetracycline may form a stable calcium complex in any bone-forming tissue with no serious harmful effects reported thus far in humans.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products. Treatment of streptococcal infections should continue for 10 days, even though symptoms have subsided.

Capsules: 150 mg; Tablets: film coated — 300 mg, 150 mg and 75 mg of demethylchlortetracycline HCl.

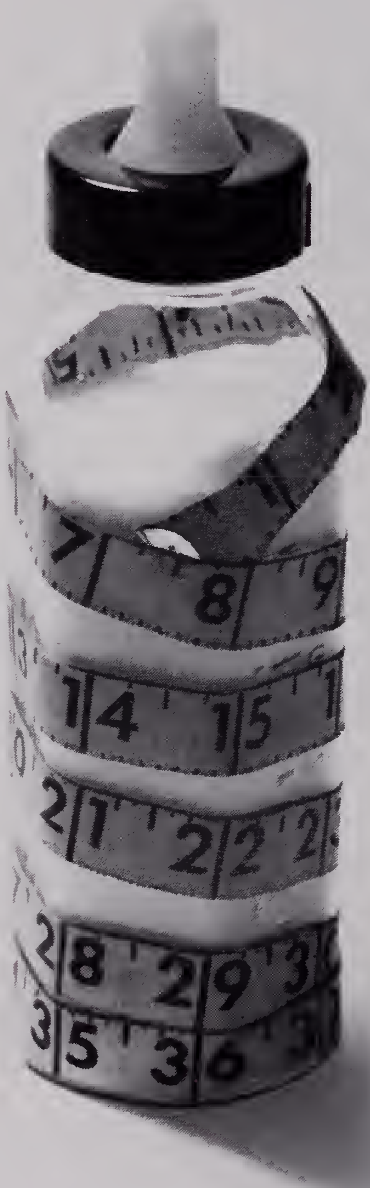
DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

Lederle LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York

HOW DO YOU MEASURE PROTEIN EFFICIENCY IN A FORMULA?



Concentrated
MODILAC
Gerber

Here are the answers on the Gerber Baby Formula...Modilac,™ as clinically confirmed by the Lowe* study:

1. What determines protein efficiency? As you probably know...the amount of weight an infant gains per gram of protein. Modilac, with a protein level intermediate between that of breast milk and cow's milk, demonstrated a definite superiority to high-protein evaporated milk formulas. In this study, Modilac-fed infants gained over 4 grams more weight per gram of protein.

2. What makes the protein in the Gerber Baby Formula so efficient? In contrast to evaporated milk and many premodified formulas, Modilac is 'flash-sterilized' rather than autoclaved. Lessened heat damage is presumed to be a factor in the greater protein efficiency of flash-sterilized Modilac.

3. What is the value of Modilac's intermediate protein level? It enables Modilac to satisfy nutritional needs without physiologic strain. Higher-protein formulas may impose a greater renal solute load than Modilac.

4. What kind of weight do infants gain on the Gerber Baby Formula? The Modilac-fed babies in Lowe's study had greater linear growth but weight gains comparable to those of the evaporated milk-fed babies. This suggests a higher proportion of lean body mass for the Modilac-fed babies.

---

*Lowe, Charles U., M. D., Mosovich, Luis L., M. D., and Pessin, Vivian, Ph. D.: Effects of Protein Level and Type of Heat Treatment of Milk Formulas on Growth and Maturation of Infants, J. Pediatrics 64:666-682 (May) 1964.

"Tomorrow in Today's Hands"

BY JAMES J. LIGHTBODY, M.D.

MSMS PRESIDENT'S MESSAGE

Consider These Points . . .

(Editor's Note: At our suggestion, Doctor Lightbody has consented to using portions of his address to the 1968 House of Delegates for his President's Page in this issue.)

Let us hope that in the year ahead, that we, as physicians, will continue to give the best medical care possible to all segments of our population. The changes we are seeing in medical practice and hospitals are medical expressions of the same changes that are occurring in education, industry, government and in the entire social landscape.

The scientific progress of medicine, rising per diem costs in hospitals, and the mounting shortages of personnel to deliver high quality medical care are causing far-reaching changes in the whole spectrum of health service. The benefits of latest medical techniques can be delivered only through the inter-action of many specialists, and that in itself inevitably introduces an element of impersonality in the way the patient is treated.

It is fashionable in some quarters to level a constant barrage of criticism at physicians. Doctors are blamed for all the ills of society from juvenile delinquency to air pollution. This is both unjust, unfair and not based on the facts. The so-called "image" of the physician is still considered to be the highest and best of the professional and nonprofessional groups.

We should continue to support the activities of the state and local health departments as their activities many times overlap with our own health programs concerned with direct patient care.

One of the matters of great current interest to the Michigan State Medical Society is its relationship with the Negro physicians in this state, and this, I believe, is a major challenge and should be squarely met with the endorsement of a coordinated, bilateral program to improve our communications with the Detroit Medical Society and National Medical Association. Negroes constitute 11.4% of the nation's population, but have only 2.2% of the nation's physicians. According to a recent report released by the American Association of American Colleges, approximately 300 Negro students are expected to enter United States medical schools this fall. This represents a 50% increase over the situation five years ago.

The majority of Negro physicians have felt that the American Medical Association did not have a realistic motivated program to assure better care for Negro patients and did not fully comprehend the professional load that the Negro physicians of this country were carrying in attempting to take care of the great number of Negro patients. The difficulties that some Negro physicians have had in gaining hospital staff appointments is well-documented, but this is also true of some white physicians.

Specifically, I would suggest that state and county medical societies re-evaluate their interests in programs affecting the medical care of both the black and white poorer segments of our urban areas particularly, and make every effort to improve the professional relations of Negro physicians in all areas of health activities. I feel, however, that Negro physicians themselves should make a greater effort to participate in county and state medical societies' programs and activities so that we can eventually eliminate any racial inequities that may now exist.

Another matter of major concern is the care of the older people who are chronically ill. We must see the older patient as one of the great challenges in medicine rather than a candidate for custodial care. First class care for older people will lead to improved, preventive measures for younger ones. This frequently involves participation of county, state and federal programs, but this is going to be an expanding area of activity in the years ahead and the medical profession must concern itself in cooperating with and giving direction to public agencies.

The transition of our medical care system simply mirrors the transition of our whole society. Let us hope that this transition will bring some degree of stability—and perhaps, some degree of tranquility.

The new direction in which American medicine is going is not necessarily bad because it is different. William Osler wisely said: "The philosophies of one age become the absurdities of the next, and the foolishness of yesterday has become the wisdom of tomorrow."

Finally...a salicylate superior to aspirin?

Not at all, Doctor...but

magan™

(magnesium salicylate, W-T)

should be considered for your arthritic and rheumatic patients who cannot tolerate aspirin.

Surveys* made in 1966 and 1967 among private practice physicians showed an incidence of intolerance to aspirin ranging from 3-85%. The majority of physicians surveyed reported an intolerance in 10-30% of their patients.

How does this compare with your experience?

WARREN-TEED PHARMACEUTICALS INCORPORATED
COLUMBUS, OHIO 43215
SUBSIDIARY OF **ROHM AND HAAS COMPANY**

10:30

*by two independent national research organizations

Don’t use Magan on all your patients–

consider Magan for those patients who cannot take aspirin because of gastric discomfort

Private Practice Physicians tried Magan on almost 700 patients whom they judged intolerant to aspirin and other salicylates.

The majority of these patients could take Magan and obtain the benefit of salicylate therapy.

magan **an alternate salicylate**

(magnesium salicylate, W-T)

May be tolerated by some persons intolerant to aspirin by reason of gastrointestinal irritation.

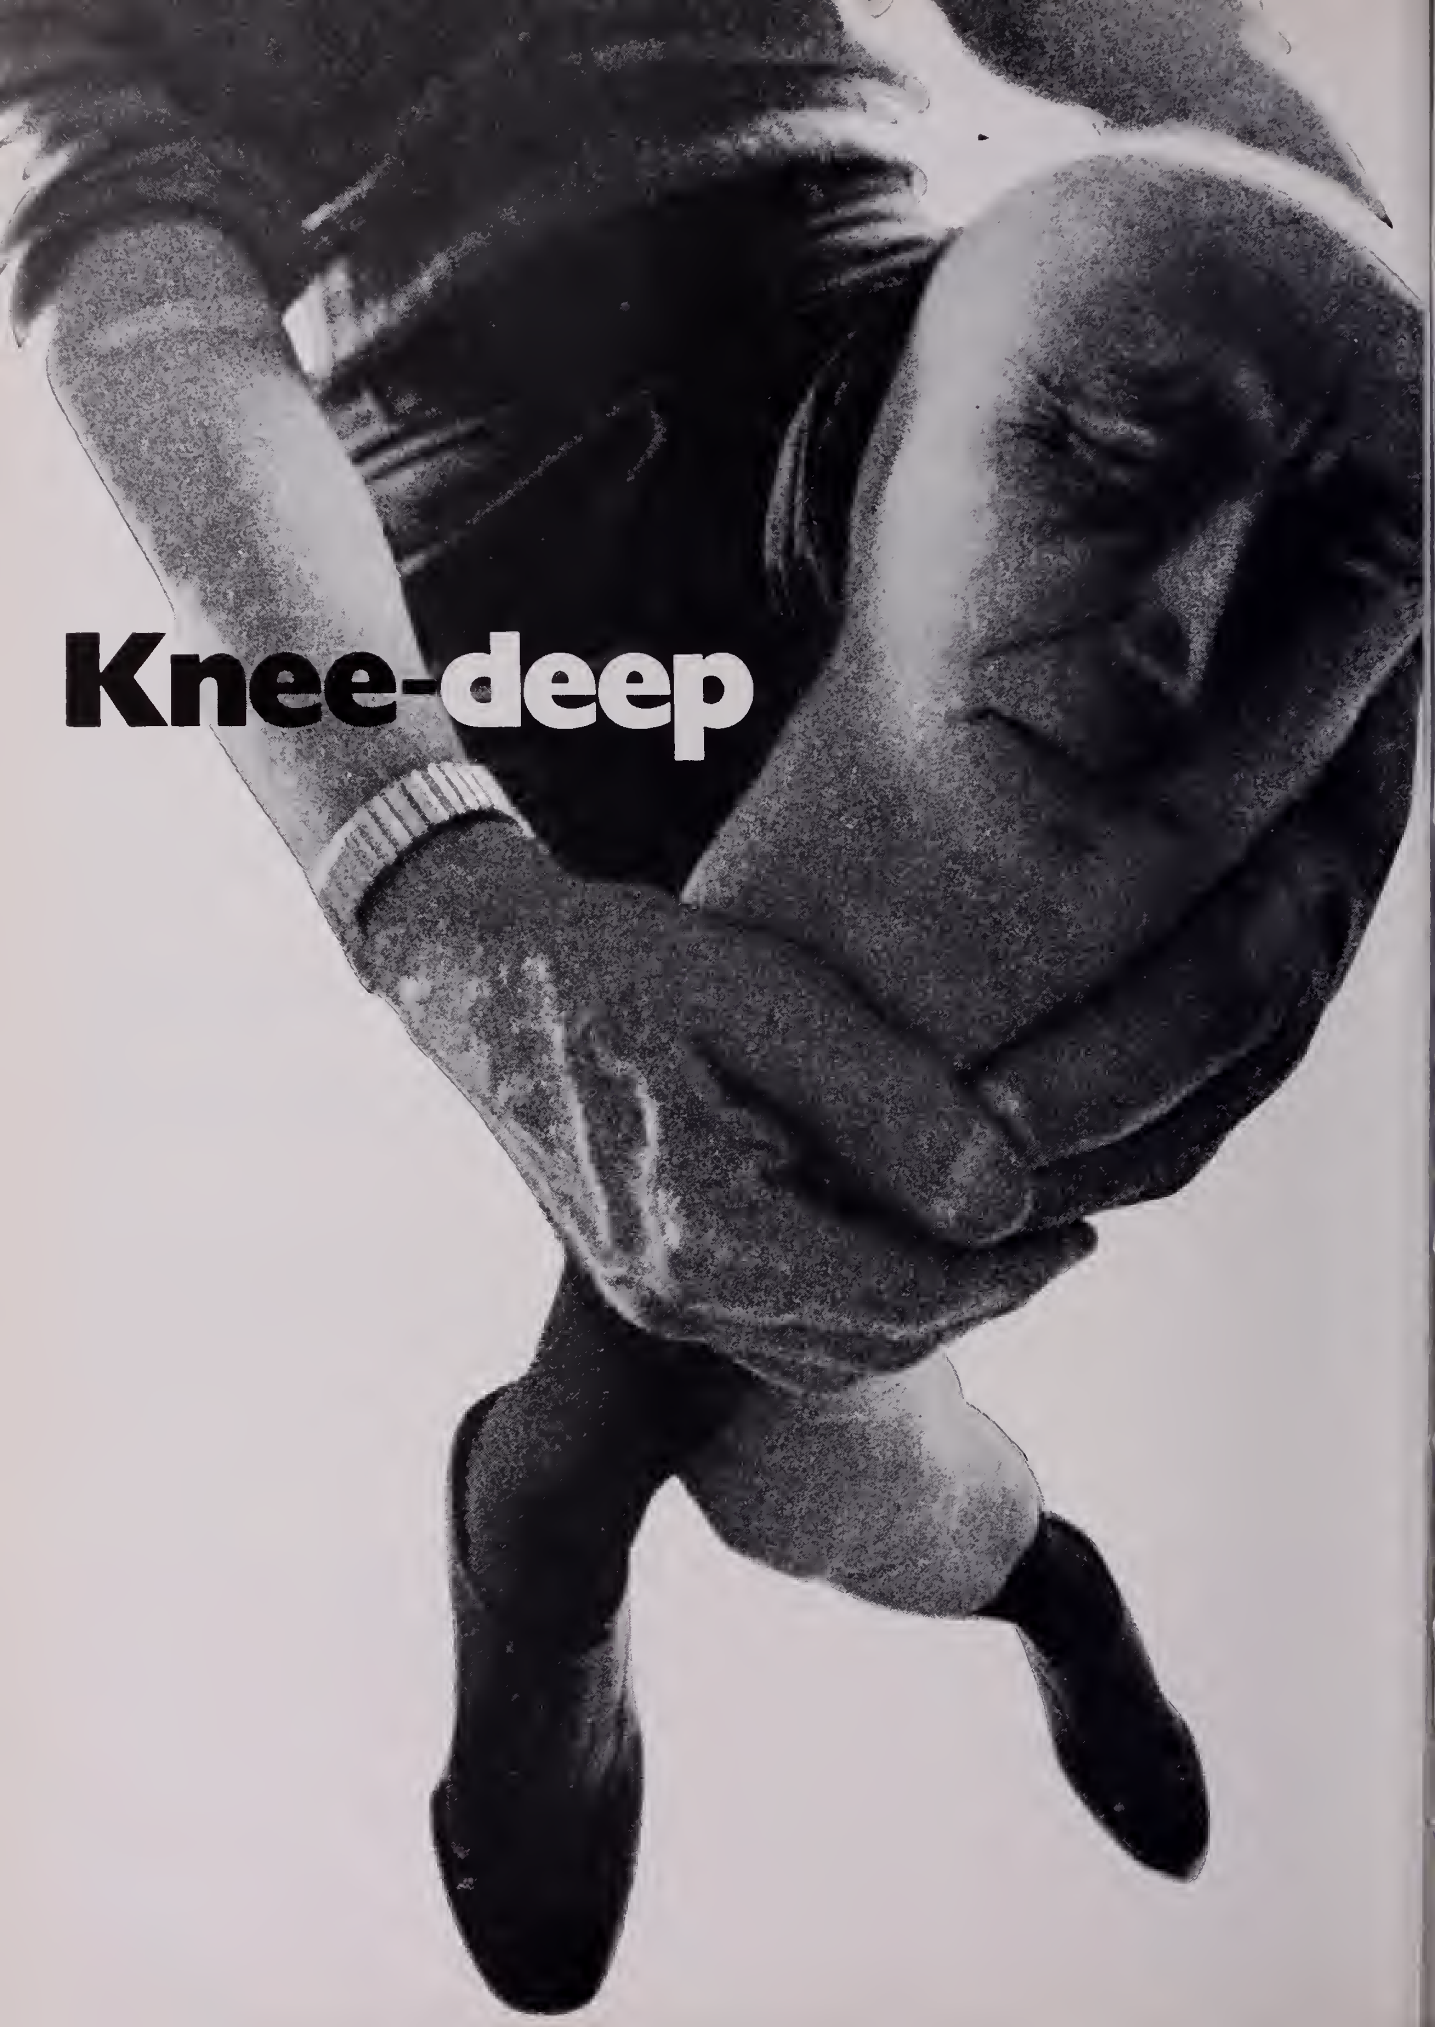
Magan is a new salicylate product from Warren-Teed.

A single chemical entity . . . no coating, no buffering, sodium free and non-acetylated.

Composition: Each orange colored tablet contains 5 grains (approx. 325 mg) of magnesium salicylate.

Dosage: 1 or 2 tablets every 4 hours with a full glass of water.

Knee-deep



TA-6006

in osteoarthritic pain

If aspirin doesn't help, move in with Tandearil.

The trial period is brief: 1 week. Try one tablet q.i.d. at first. Tandearil usually starts working within 3 to 4 days. When response occurs, as little as 1 or 2 tablets daily may hold back pain and stiffness, and increase joint motion.

On the next page is a summary of adverse reactions, contraindications, warning and precautions.

Tandearil.
It can help get his mind off his knee.

Please review full Prescribing Information carefully before prescribing.

For osteoarthritic knees, spines, shoulders, hips, etc.:

Tandearil®
oxyphenbutazone

Tandearil, oxyphenbutazone:
For brief summary see next page.

Geigy

TA-6006

Tandearil®
oxyphenbutazone

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: This drug is an analog of phenylbutazone; sensitive patients may be cross-reactive. If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy, and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patients should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia), sudden weight gain (water retention), skin reactions, black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension, the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), or a generalized allergic reaction similar to a serum sickness syndrome may occur and require permanent withdrawal of medication. Agranulocytosis can occur suddenly in spite of regular, repeated normal white counts. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angiitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis: Initial: 3 to 6 tablets daily in divided doses. Usually unnecessary to exceed 4 tablets daily. A trial period of one week is considered adequate to determine the therapeutic effect of the drug. Maintenance: Effective level often achieved with 1 or 2 tablets daily, should not exceed 4 tablets daily.

In selecting appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response.

Availability: Tan, round, sugar-coated tablets of 100 mg. in bottles of 100 and 1000.

Dilantin®
(diphenylhydantoin)

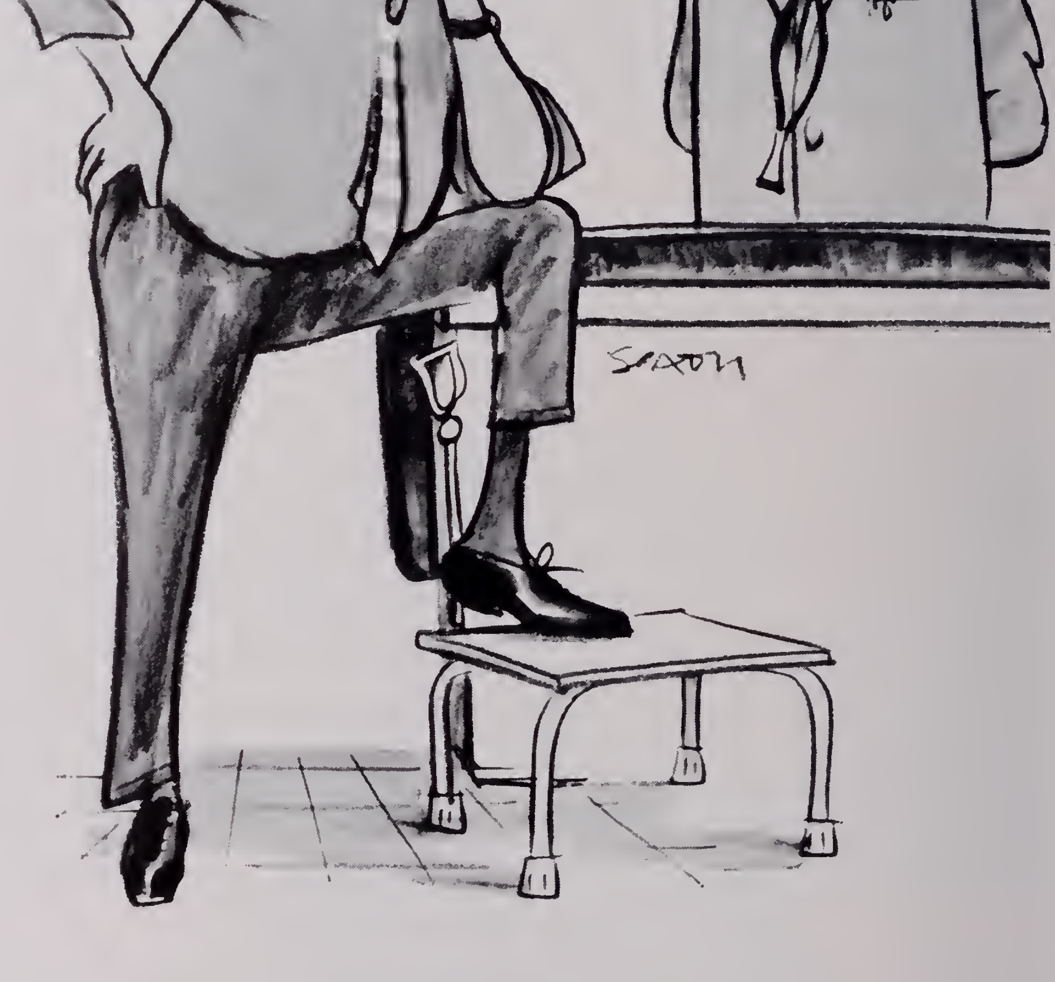
PARKE-DAVIS

In untold thousands of epileptic patients... Dilantin has been, and continues to be, the bedrock of therapy.

DILANTIN is useful in the treatment of grand mal epilepsy and certain other convulsive states. Its use will prevent or greatly reduce the incidence and severity of convulsive seizures in a substantial percentage of epileptic patients, without the hypnotic and narcotizing effects of many anticonvulsant drugs.
PRECAUTIONS: Periodic examination of the blood is advisable. Nystagmus in combination with diplopia and ataxia indicates dosage should be reduced. The possibility of toxic effects during pregnancy has not been explored. ADVERSE REACTIONS: Allergic phenomena such as polyarthropathy, fever, skin eruptions, and acute generalized morbilliform eruptions with or without fever. Rarely, dermatitis goes on to exfoliation with hepatitis, and further dosage is contraindicated. Gingival hypertrophy, hirsutism, and excessive motor activity are occasionally encountered. During initial treatment, side effects may include gastric distress, nausea, weight loss, nervousness, sleeplessness, feeling of unsteadiness. Macrocytosis, megaloblastic anemia, leukopenia, granulocytopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic anemia have been reported. Nystagmus, lymphadenopathy, lupus erythematosus, erythema multiforme (Stevens-Johnson syndrome), and a syndrome resembling infectious mononucleosis with jaundice have occurred.
DILANTIN is supplied in several forms including Kapseals® containing 0.1 Gm. and 0.03 Gm. diphenylhydantoin sodium.
Parke, Davis & Company, Detroit, Michigan 48232

The color combinations of the banded capsules are Parke-Davis trademarks. The orange-banded white capsule identifies Parke-Davis 0.1 Gm. diphenylhydantoin sodium; the pink-banded white capsule 0.03 Gm. diphenylhydantoin sodium.

PARKE-DAVIS 015R67



Nothing else I've tried seems to work, so I decided to give you a crack at it.

Say you saw it in Michigan Medicine

Some U.R.I. patients are more miserable than others.

That's why we make Novahistine® tablets in two different formulations.

And let you control the dosage.

With Novahistine LP tablets and Novahistine Singlet tablets you have the range and flexibility of decongestant dosage that lets you prescribe for the needs of the individual patient.

Novahistine LP tablets are most useful for relief of nasal congestion in patients without pain or fever.

Novahistine Singlet tablets, which provide analgesic-antipyretic effect, as well as decongestant action, are indicated for upper respiratory infections accompanied by pain, aches and fever.

Whether you prescribe Novahistine LP or Novahistine Singlet, a total daily dose of 3 or 4 tablets will usually provide effective, continuous relief.

Use cautiously in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution ambulatory patients that drowsiness may result.

Each Novahistine LP tablet contains phenylephrine hydrochloride, 25 mg.; and chlorpheniramine maleate, 4 mg.

Each Novahistine Singlet tablet contains phenylephrine hydrochloride, 40 mg.; chlorpheniramine maleate, 8 mg.; and acetaminophen, 500 mg.

DOW PITMAN-MOORE DIVISION OF THE DOW CHEMICAL COMPANY, INDIANAPOLIS

NOVAHISTINE LP
NOVAHISTINE SINGLET

Photo professionally posed.

No injection after all!

This penicillin produces high, fast levels—orally.

Pen•Vee® K is usually so rapidly and completely absorbed that therapeutic penicillin levels are attained within 15 to 30 minutes. Thus it can often obviate the need for penicillin injections. The higher serum levels produced generally last longer than with those of oral penicillin G.

Indications: Infections susceptible to oral penicillin G: prophylaxis and treatment of streptococcal infections; treatment of pneumococcal, gonococcal, and susceptible staphylococcal infections; prophylaxis of rheumatic fever in patients with a previous history of the disease.
Contraindications: Infections caused by nonsusceptible organisms; history of penicillin sensitivity.
Warnings: Acute anaphylaxis (may prove fatal unless promptly controlled) is rare but more frequent in patients with previous penicillin sensitivity, bronchial asthma or other allergies. Resuscitative (epinephrine, aminophylline, pressor amines) and supportive (antihistamines, methylprednisolone sodium succinate) drugs should be readily available. Other rare hypersensitivity reactions include nephropathy, hemolytic anemia, leucopenia and thrombocytopenia. In suspected hypersensitivity, evaluation of renal and hematopoietic systems is recommended.
Precautions: In suspected staphylococcal infections, perform proper laboratory studies including sensitivity tests. If overgrowth of nonsusceptible organisms occurs (constant observation is essential), discontinue penicillin and take appropriate measures. Whenever allergic reactions occur, withdraw penicillin unless condition being treated is considered life threatening and amenable only to penicillin. Penicillin may delay or prevent appearance of primary syphilitic lesions. Gonorrhea patients suspected of concurrent syphilis should be tested serologically for at least 3 months. When lesions of primary syphilis are suspected, dark-field examination should precede use of penicillin. Treat beta-hemolytic streptococcal infections with full therapeutic dosage for at least 10 days to prevent rheumatic fever or glomerulonephritis. In staphylococcal infections, perform surgery as indicated.
Adverse Reactions: (Penicillin has significant index of sensitization): Skin rashes, ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; serum sickness-like reactions, including chills, fever, edema, arthralgia and prostration. Severe and often fatal anaphylaxis has been reported (see "Warnings").
Composition: Tablets—125 mg. (200,000 units), 250 mg. (400,000 units), 500 mg. (800,000 units); Liquid—125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc.

ORAL **PEN•VEE® K**

(potassium phenoxymethyl penicillin) Wyeth®

"Breathing's a snap again," he said gingerly.
(COMPLIMENTS OF DIMETAPP)

Help clear up that miserable stuffed-up feeling with Dimetapp. Each hard-working Extentab brings welcome relief from the stuffiness, drip and congestion of upper respiratory conditions for up to 10-12 hours. Yet, patients seldom experience drowsiness or overstimulation. The key to success is the Dimetapp formula: Dimetane (brompheniramine maleate)—along with phenylephrine and phenylpropanolamine, two time-tested decongestants. They get the job done . . . in a hurry.

Indications: Dimetapp is indicated for symptomatic relief of the allergic manifestations of respiratory illnesses, such as the common cold and bronchial asthma, seasonal allergies, sinusitis, rhinitis, conjunctivitis, and otitis. *Contraindications:* Hypersensitivity to antihistamines. Not recommended for use during pregnancy. *Precautions:* Until patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. *Side Effects:* Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia, have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability or excitement may be encountered. *Dosage:* 1 Extentab morning and evening. *Supplied:* Bottles of 100 and 500.

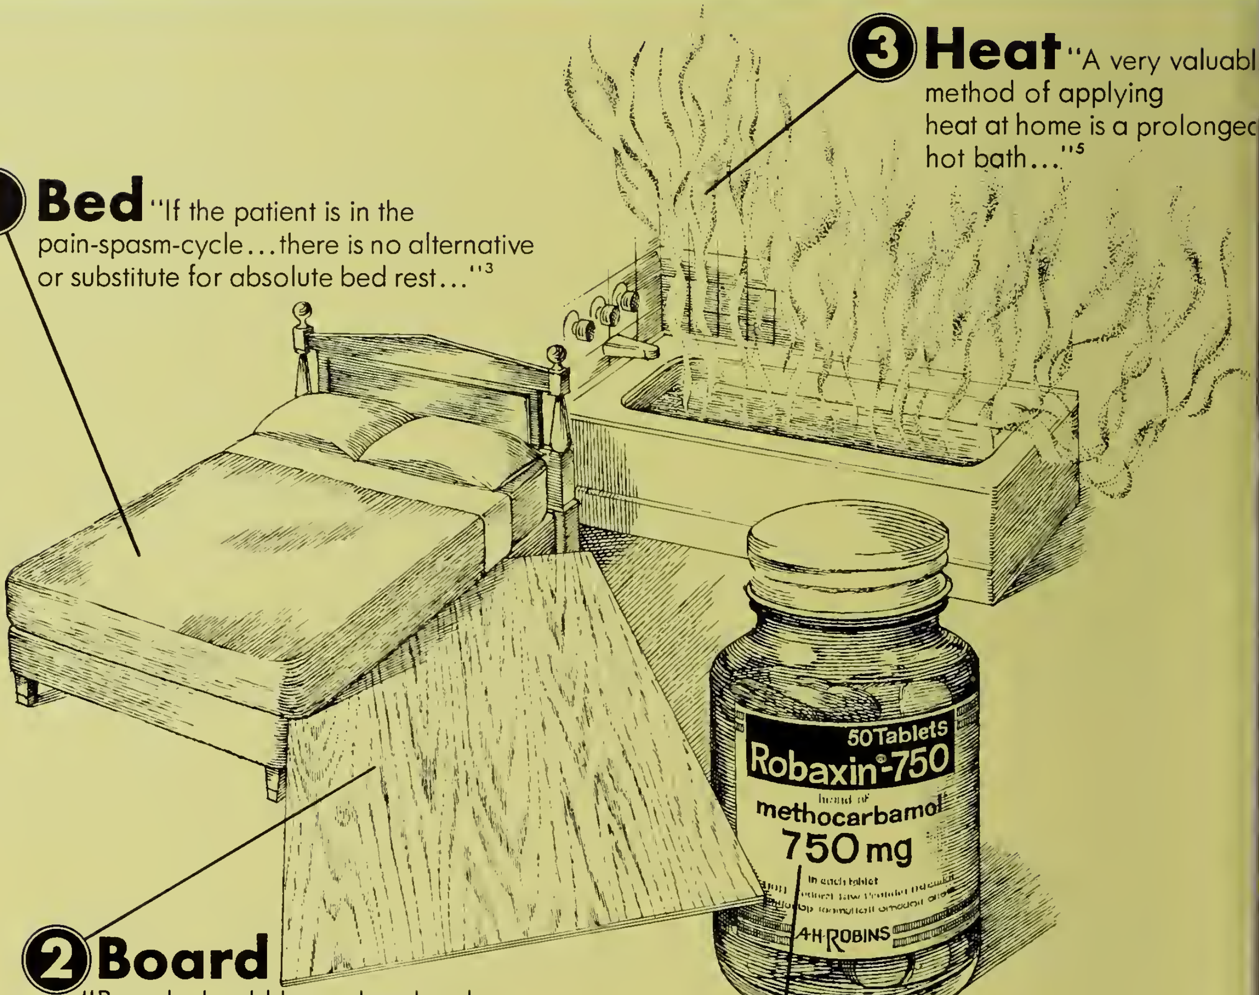
LOW-BACK PAIN

A CONSERVATIVE, FOUR-POINT PROGRAM

The low back pain that is most frequently seen in general practice is mechanical in nature, i.e., postural back pain, joint dysfunction and acute back strain.[1,2] For this type of discomfort, a conservative regimen is usually sufficient to relieve aches and pains, and to help keep the patient functioning. Components of this basic program include:



① Bed "If the patient is in the pain-spasm-cycle...there is no alternative or substitute for absolute bed rest..."[3]

② Board "Boards should be ordered under the mattress...these boards act by immobilizing the spine..."[4]

③ Heat "A very valuabl method of applying heat at home is a prolonged hot bath..."[5]

④ Robaxin®-750 (methocarbamol, 750 mg. capsule-shaped tablets) A well-tolerated[6] skeletal muscle relaxant, methocarbamol helps relieve spasm "...without interfering with normal tone and movement."[7] And there is little likelihood of sedation.[6]

Indicated for relief of skeletal muscle spasm. **Contraindicated** in hypersensitive patients. **Side Effects** (lightheadedness, dizziness, drowsiness, nausea) may occur rarely, but usually disappear on reduced dosage. Hypersensitivity reactions develop infrequently. See product literature for further details. **Also available:** Robaxin® Tablets (methocarbamol, 500 mg.) Robaxin Injectable (methocarbamol, 1 Gm./10 cc.)

In peptic ulcer:

the antacid puzzle

solved by Mylanta®

aluminum and magnesium hydroxides *plus* simethicone

"will it ease the pain?"

Mylanta helps relieve ulcer pain with the two most widely prescribed antacids: aluminum and magnesium hydroxides.

will it help "my gassy stomach"?

Mylanta *also* contains simethicone: for concomitant relief of G.I. gas distress.

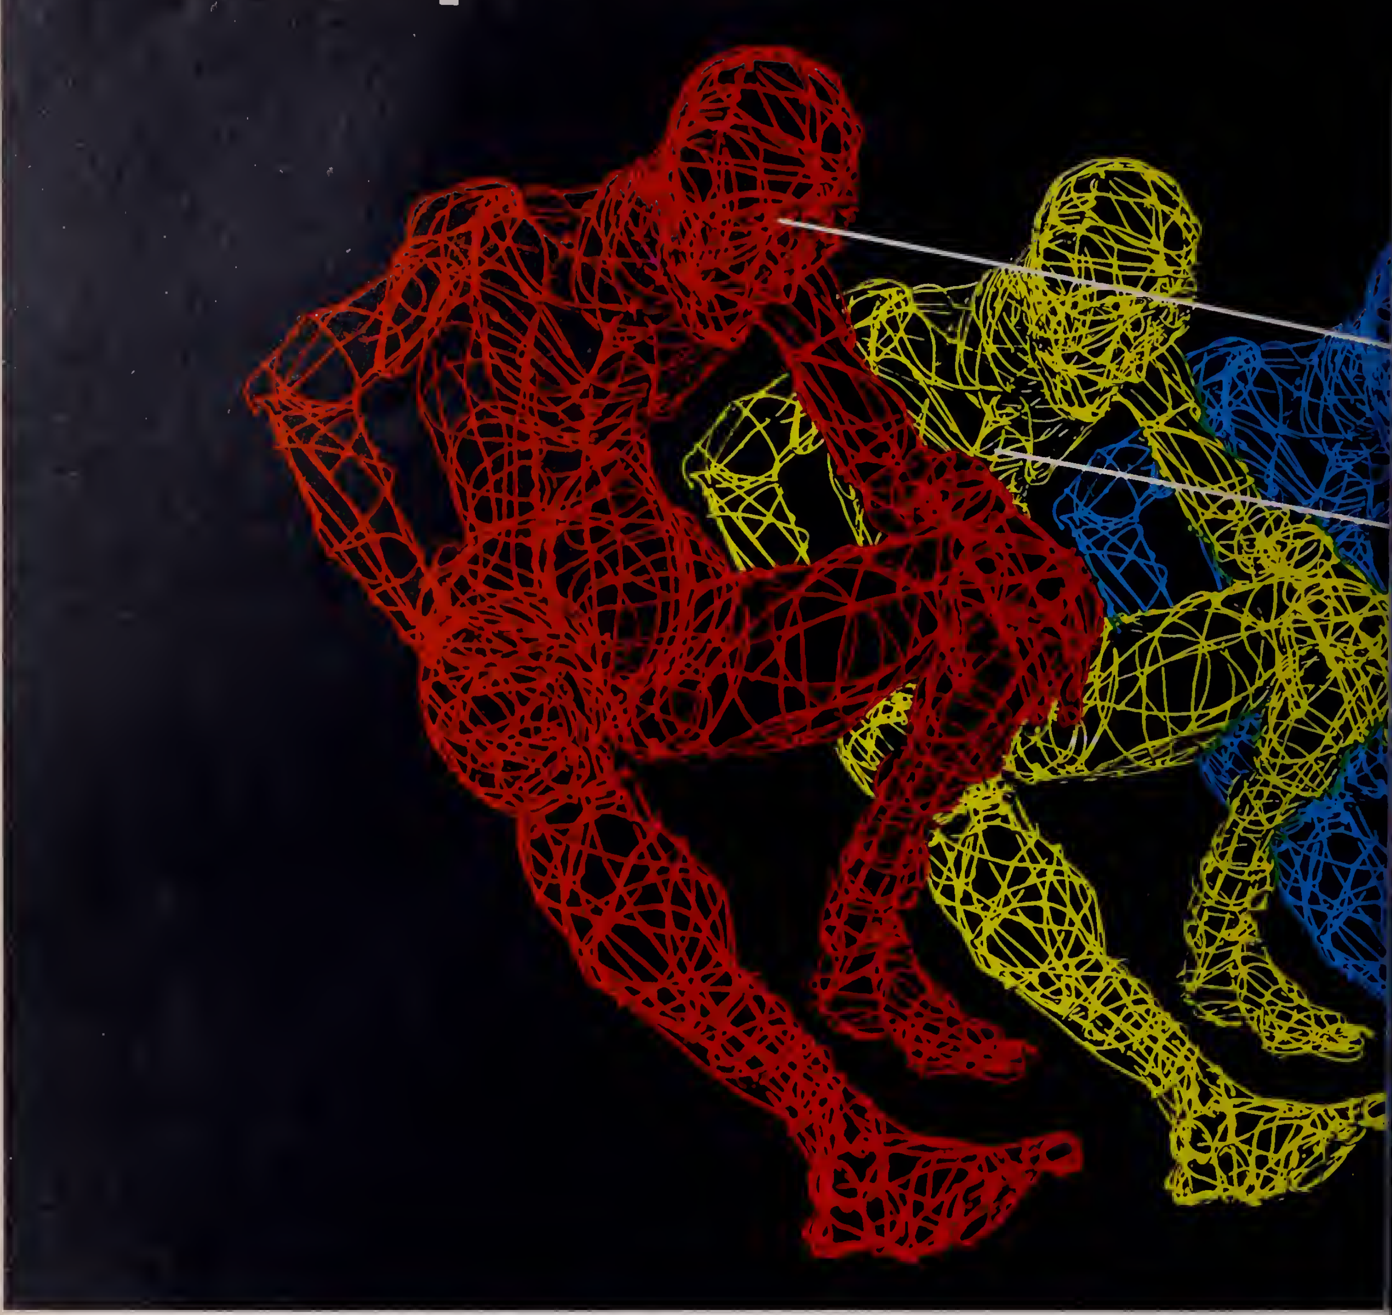
"will this one taste O. K.?"

The *prolonged* acceptance of Mylanta was recently confirmed in 87.5% of 104 patients—after a total of 20,459 documented days of therapy.* *Danhof, I. E.: Report on file.

Composition: Each Mylanta chewable tablet or teaspoonful (5 ml.) contains: magnesium hydroxide, 200 mg.; aluminum hydroxide, dried gel, 200 mg.; simethicone, 20 mg. *Dosage:* One or two tablets (well chewed or allowed to dissolve in the mouth) or one or two teaspoonfuls to be taken between meals and at bedtime.

Stuart Division/Pasadena, Calif.
ATLAS CHEMICAL INDUSTRIES, INC.

a comprehensive hematinic



Description: Each Pulvule® contains—

Special Liver-Stomach Concentrate, Lilly (containing Intrinsic Factor)	150	mg.
Cobalamin Concentrate, N.F., equivalent to Cobalamin	7.5	mcg.
(The total vitamin B_{12} activity in the Special Liver-Stomach Concentrate, Lilly, and the Cobalamin Concentrate, N.F., is 15 micrograms.)		
Iron, Elemental (as Ferrous Fumarate)	110	mg.
Ascorbic Acid (Vitamin C)	75	mg.
Folic Acid	1	mg.

Indications: Trinsicon® (hematinic concentrate with intrinsic factor, Lilly) is a multifactor preparation effective in the treatment of anemias that respond to oral hematinics, including pernicious anemia and other megaloblastic anemias and also iron-deficiency anemia.

Contraindications: Hemochromatosis and hemosiderosis.

Precautions: Anemia is a manifestation that requires appropri investigation to determine its cause or causes.

In pernicious anemia, the use of folic acid without adequ vitamin B_{12} therapy may result in hematologic remission but n rological progression. Adequate doses of vitamin B_{12} (parente or oral with potent intrinsic factor as in Trinsicon® [hemati concentrate with intrinsic factor, Lilly]) usually prevent, halt, improve the neurological changes.

As with all preparations containing intrinsic factor, resista may develop in some cases of pernicious anemia to the poten tion of absorption of physiological doses of vitamin B_{12}. If res ance occurs, parenteral therapy, or oral therapy with so-ca massive doses of vitamin B_{12}, may be necessary. No single r men fits all cases, and the status of the patient observec follow-up is the final criterion for adequacy of therapy. Peric

You can treat combined deficiencies with

Trinsicon®

—the multifactor hematinic

Vitamin B_{12} plus intrinsic factor (15 mcg. B_{12} activity)—helps provide adequate levels of this important vitamin.

Folic acid (1 mg.)—treats nutritional macrocytic anemias and/or malabsorption syndromes.

Ascorbic acid (75 mg.)—augments the conversion of folic acid to its active form and helps iron absorption.

Iron (110 mg.)—treats hypochromic anemia.

nical and laboratory studies are considered essential and are commended.

verse Reactions: In rare instances, iron in therapeutic doses oduces gastro-intestinal reactions, such as diarrhea or constition. Reducing the dose and administering it with meals will nimize these effects.

In extremely rare instances, skin rash suggesting allergy has lowed oral administration of liver-stomach material. Instances apparent allergic sensitization have also been reported after al administration of folic acid.

sage: One Pulvule twice a day. (Two Pulvules daily produce a andard response in the average uncomplicated case of perniDus anemia.)

w Supplied: Pulvules Trinsicon® (hematinic concentrate with rinsic factor, Lilly), in bottles of 60 and 500. [032568]

"The inconvenience of a cold"

For a cold, NTz® Nasal Spray provides rapid relief of nasal symptoms. Relief starts with the first spray which opens the inferior part of the common meatus. A second spray, a few minutes later, will shrink the turbinates to help provide sinus drainage and ventilation. Dosage may be repeated every three or four hours as needed, for temporary relief of symptoms. NTz is well tolerated but overdosage should be avoided.

As a sinusitis deterrent, NTz Nasal Spray can be used to keep the nasal passages open during a cold to help prevent development of acute sinusitis—or to help prevent the acute condition from becoming chronic.

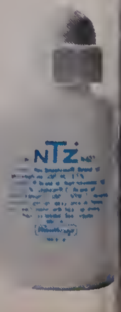
Supplied: NTz Nasal Spray, plastic squeeze bottles of 20 ml.; NTz Nasal Solution, bottles of 30 ml. (1 fl. oz.) with dropper.

NTz is more than a simple vasoconstrictor. It contains

Neo-Synephrine® (brand of phenylephrine) HCl 0.5 per cent, the major component, virtually synonymous with fast, efficient but gentle nasal vasoconstriction.

Thenfadil® (brand of thenyldiamine) HCl 0.1 per cent, topical antihistamine for reduction of rhinorrhea, sneezing or itching. It combats the allergic reactions that may occur in colds or sinusitis.

Zephiran® (brand of benzalkonium, as chloride, refined) 1:5000, antiseptic preservative and wetting agent to promote penetration and spread of the formula.



Winthrop Laboratories, New York, N.Y. 10016

BURROUGHS WELLCOME & CO. (U.S.A.) INC.
Tuckahoe, N.Y.

Muscle in Spasm

and Valium (diazepam)

The ability of Valium to help relieve skeletal muscle spasm—as well as psychic tension—demonstrates its clinical value and versatility.

The muscle-relaxant effect obtained with Valium, used adjunctively with other drugs or physiotherapy, favorably affects the entire cluster of spasm-related symptoms . . . helps accelerate return to normal activity.

When skeletal muscle spasm and psychic tension coexist, the calming effect of Valium is an added therapeutic benefit that contributes to the total management of the patient.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of child-bearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Valium® (diazepam)

Hygroton, brand of chlorthalidone, may mean troublesome side effects for certain patients. And you can't prescribe it in cases of demonstrated hypersensitivity to the drug or in severe renal or hepatic diseases.

Before writing it for your patients, please check the Prescribing Information. It's summarized on the next page.

lygroton
lorthalidone in edema and hypertension

Geigy

CARMEL
CATERING

in edema and hypertension

A little Hygroton® can work a long da

chlorthalidone

Indications: Hypertension and many types of edema involving retention of salt and water.

Contraindications: Hypersensitivity and most cases of severe renal or hepatic diseases.

Warning: With the administration of enteric-coated potassium supplements, which should be used only when adequate dietary supplementation is not practical, the possibility of small-bowel lesions (obstruction, hemorrhage, and perforation) should be kept in mind. Surgery for these lesions has been required frequently and deaths have occurred. Discontinue enteric-coated potassium supplements immediately if abdominal pain, distention, nausea, vomiting, or gastrointestinal bleeding occur.

Use with caution in pregnant women and nursing mothers since the drug may cross the placental barrier and appear in cord blood and since thiazides may appear in breast milk. The drug may result in fetal or neonatal jaundice, thrombocytopenia, and possibly other adverse reactions which have occurred in the adult. When used in women of childbearing age, balance benefits of drug against possible hazards to fetus.

Precautions: Antihypertensive therapy with this drug should always be initiated cautiously in postsympathectomy patients and in patients receiving ganglionic blocking agents, other potent antihypertensive drugs or curare. Reduce dosage of concomitant antihypertensive agents by at least one-half. Because of the possibility of progression of renal damage, periodic determination of the BUN is indicated. Discontinue if the BUN rises or liver dysfunction is aggravated. Hepatic coma may be precipitated.

Electrolyte imbalance, sodium and/or potassium depletion may occur. If potassium depletion should occur during therapy, the drug should be discontinued and potassium supplements given, provided the patient does not have marked oliguria.

Take special care in cirrhosis or severe ischemic heart disease and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended.

Adverse Reactions: Nausea, gastric irritation, vomiting, anorexia, constipation and cramping, dizziness, weakness, restlessness, hyperglycemia, glycosuria, hyperuricemia, headache, muscle cramps, orthostatic hypotension, which may be potentiated whe chlorthalidone is combined with ba biturates, narcotics or alcohol, apla anemia, leukopenia, thrombocytopenia, agranulocytosis, impotence, dysuria, transient myopia, skin rash urticaria, purpura, necrotizing angi acute gout, and pancreatitis when epigastric pain or unexplained G.I. symptoms develop after prolonged administration. Other reactions reported with this class of compounds include: jaundice, xanthopsia, pare thesia, and photosensitization.

Average Dosage: 50 or 100 mg. wit breakfast daily or 100 mg. every ot day.

Availability: White, single-scored t lets of 100 mg. and aqua tablets of mg., in bottles of 100 and 1000.

Is it depression?

He says "It's my stomach..."

...but his other symptoms:

functional somatic complaints, anxiety, insomnia, anorexia, feelings of guilt

strongly suggest

an underlying depression.

---

when the diagnosis is depression

ELAVIL® HCl

(AMITRIPTYLINE HCl|MSD)

Indications: Mental depression and mild anxiety accompanying depression.

Contraindications: Glaucoma and predisposition to urinary retention. Not recommended in pregnancy.

Precautions and Side Effects: Drowsiness may occur within the first few days of therapy. Patients should be warned against driving a car or operating machinery or appliances requiring alert attention. When depression is accompanied by anxiety or agitation too severe to be controlled by ELAVIL HCl alone, a phenothiazine tranquilizer may be given concomitantly. Suicide is always a possibility in mental depression and may remain until significant remission occurs. Supervise patients closely in case they may require hospitalization or concomitant electroshock therapy. Untoward reactions have been reported after the combined use of antidepressant agents having varying modes of activity. Accordingly, consider possibility of potentiation in combined use of antidepressants. Monoamine oxidase inhibitor drugs may potentiate other drugs and such potentiation may even cause death; permit at least two weeks to elapse between administration of two agents; in such patients, initiate therapy with ELAVIL HCl cautiously with gradual increase in dosage required to obtain a satisfactory response. Caution patients about errors of judgment due to change in mood, and that the response to alcohol may be potentiated. May provoke mania or hypomania in manic-depressive patients.

Side effects include drowsiness; dizziness; nausea; excitement; hypotension; fine tremor; jitteriness; weakness; headache; heartburn; anorexia; increased perspiration; incoordination; allergic-type reactions manifested by skin rash, swelling of face and tongue, itching; numbness and tingling of limbs, including peripheral neuropathy; activation of schizophrenia which may require phenothiazine tranquilizer therapy; epileptiform seizures in chronic schizophrenics; temporary confusion, disturbed concentration or, rarely, transient visual hallucinations on high doses; evidence of anticholinergic activity, such as tachycardia, dryness of the mouth, blurring of vision, urinary retention, constipation; paralytic ileus; jaundice; agranulocytosis.

Careful observation of all patients is recommended. The antidepressant activity may be evident within 3 or 4 days or may take as long as 30 days to develop adequately, and lack of response sometimes occurs. Response to medication will vary according to severity as well as type of depression present. Elderly patients and adolescents can often be managed on lower dosage levels.

Supplied: Tablets ELAVIL HCl, containing 10 mg., 25 mg., and 50 mg. amitriptyline HCl, bottles of 100 and 1000; Injection ELAVIL HCl, in 10-cc. vials, containing per cc.: 10 mg. amitriptyline HCl, 44 mg. dextrose, 1.5 mg. methylparaben, and 0.2 mg. propylparaben.

MERCK SHARP & DOHME Division of Merck & Co INC West Point Pa 19486

WHERE TODAY'S THEORY IS TOMORROW'S THERAPY

It's almost as if you were there to give an injection of penicillin

V-Cillin K®, Pediatric dependable oral penicillin therapy

Potassium Phenoxymethyl Penicillin

Description: V-Cillin K, the potassium salt of V-Cillin® (phenoxymethyl penicillin, Lilly), combines acid stability with immediate solubility and rapid absorption. Higher, more rapid serum levels are obtained than with equal oral doses of penicillin G.

Indications: Streptococcus, pneumococcus, and gonococcus infections; infections caused by sensitive strains of staphylococci; prophylaxis of streptococcus infections in patients with a history of rheumatic fever; and prevention of bacterial endocarditis after tonsillectomy and tooth extraction in patients with a history of rheumatic fever or congenital heart disease.

Contraindication: Penicillin hypersensitivity.

Warnings: In rare instances, penicillin may cause acute anaphylaxis which may prove fatal unless promptly controlled. This type of reaction appears more frequently in patients with a history of sensitivity reactions to penicillin or with bronchial asthma or other allergies. Resuscitative drugs should be readily available. These include epinephrine and pressor drugs (as well as oxygen for inhalation) for immediate allergic manifestations and antihistamines and corticosteroids for delayed effects.

Precautions: Use cautiously, if at all, in a patient with a strongly positive history of allergy.

In prolonged therapy with penicillin, and particularly with high parenteral dosage schedules, frequent evaluation of the renal and hematopoietic systems is recommended.

In suspected staphylococcus infections, proper laboratory studies (including sensitivity tests) should be performed.

The use of penicillin may be associated with the overgrowth of penicillin-insensitive organisms. In such cases, discontinue administration and take appropriate measures.

Adverse Reactions: Although serious allergic reactions are much less common with oral penicillin than with intramuscular forms, manifestations of penicillin allergy may occur.

Penicillin is a substance of low toxicity, but it possesses a significant index of sensitization. The following hypersensitivity reactions have been reported: skin rashes ranging from maculopapular eruptions to exfoliative dermatitis; urticaria; and reactions resembling serum sickness, including chills, fever, edema, arthralgia, and prostration. Severe and often fatal anaphylaxis has occurred (see Warnings). Hemolytic anemia, leukopenia, thrombocytopenia, and nephropathy are rarely observed side-effects and are usually associated with high parenteral dosage.

Administration and Dosage: Usual dosage range, 125 mg. (200,000 units) three times a day to 500 mg. (800,000 units) every four hours. For infants, 50 mg. per Kg. per day divided into three doses.

See package literature for detailed dosage instructions for prophylaxis of streptococcus infections, surgery, gonorrhea, and severe infections.

How Supplied: Tablets V-Cillin K® (Potassium Phenoxymethyl Penicillin Tablets, U.S.P.), 125 mg. (200,000 units), 250 mg. (400,000 units), and 500 mg. (800,000 units).

V-Cillin K® (potassium phenoxymethyl penicillin, Lilly), Pediatric, for Oral Solution, 125 mg. (200,000 units) and 250 mg. (400,000 units) per 5 cc. of solution (approximately one teaspoonful). [042567A]

Warthin's Tumor Revisited

ABSTRACT: Warthin's tumor is a tubulo-papillary-cystic oncocytoma arising from parotid duct cells enclaved in lymph nodes external to or within the parotid gland. It is an asymptomatic completely benign tumor seen in middle-aged Caucasian males, representing from six to 10% of all parotid tumors. The tumor is readily removed surgically. Descriptive pathological features are reviewed.

BY MERRILL A. COHEN, M.D.
JOHN G. BATSAKIS, M.D.
BOTH OF ANN ARBOR

It is almost 40 years since A. S. Warthin[1] described and presented for the first time in the American literature the tumor, papillary cystadenoma lymphomatosum. Since then, and in numerous papers, the lesion, either by form of tribute or through facility, has been commonly called Warthin's tumor.

Many of the ensuing reports were by pathologists who, perhaps piqued by the unusual association of lymphoid and epithelial tissue displayed by the tumor, presented a variety of histogenetic theories. Two studies stand out amongst the several hundred recorded in the literature: Thompson and Bryant's[2] elucidation of the pathogenesis of the lesion and the review of the clinical features by Chaudhry and Gorlin.[3]

The present report, 40, 20 and 10 years after the three aforementioned publications, is a contemporary compendium of the clinical, pathological, experimental and nosological features of this unique tumor.

Histogenesis and Nosology

Early reports included many hypotheses for the development of the Warthin tumor.[2-4] The currently accepted theory is an origin from heterotopic salivary gland tissue within lymph nodes external to or within the parotid gland.

Thompson and Bryant[2] studied the embryonic development of the salivary glands and found that whereas the submaxillary and sublingual glands develop as compact entities, the parotid gland develops in a loose arrangement containing aggregates of lymphoid tissue, and encapsulation occurs late in ontogeny. Thus, lymph nodes become enclosed with the parotid gland, and salivary ducts and acini become included in these nodes, as well as in nodes outside the definitive gland which were excluded by the formation of the capsule. It is from these ductal epithelial elements, incorporated in lymphoid tissue outside and within the parotid capsule, that the tumors arise. The finding of ductal inclusions in lymph nodes in or near the parotid, the occasional multicentricity of Warthin's tumor in several apparently uninvolved lymph nodes, and the relatively undisturbed lymph nodal architecture seen about tumors removed at an early stage of their formation are features supporting this thesis (Figures 1-4).[5, 6]

The cause of the oxyphilic alteration in the epithelial elements is not known.

Whether or not the oxyphilic adenoma, the so-called oncocytoma, is a variant is also not known. This tumor, also composed of oxyphilic, finely granular epithelial cells may have a solid or medullary pattern, or be tubulo-papillary-cystic. It **does not** have a lymphoid component. Its origin is from salivary ductal epithelium, and the ultrastructure of the epithelium is identical to the cells of the Warthin's tumor.[7] In the Warthin's tumors studied by Thompson and Bryant,[2] masses of polyhedral oxyphilic epithelial cells were noted, similar in pattern to the medullary oncocytoma, and so for classification purposes, Warthin's tumor may be regarded as an oncocytoma of tubulo-papillary-cystic type arising from parotid duct cells enclaved in lymph nodes.[5]

Clinical Features

Although Warthin's tumor has been reported as occurring in a wide age span ($2\frac{1}{2}$[8] - 92 years[9]), 82% are found in patients between 41 and 70 years of age (avg. = 55.6 years[3]). There is a decided (5 to 1) male predominance.[3] Only one case has been reported in a Negro.

The tumor is asymptomatic; only 10% of patients present with complaints other than a symptomless mass, those complaints being pain, pressure sensations or rapid increase in size of the tumor. Facial nerve weakness has been reported only once. The lack of discomfort accounts for the

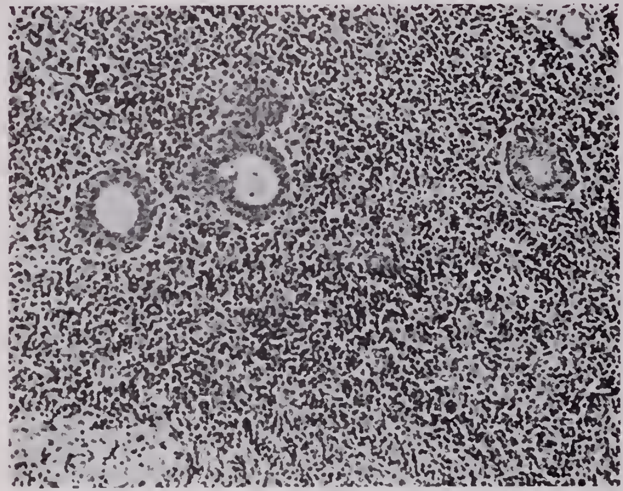

FIGURE 1

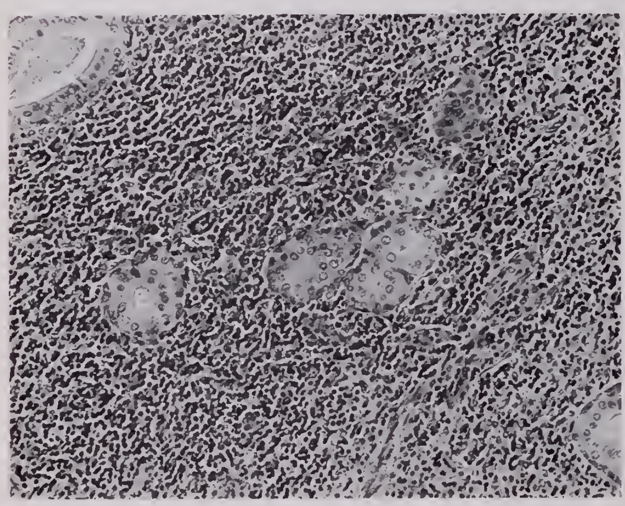

FIGURE 2

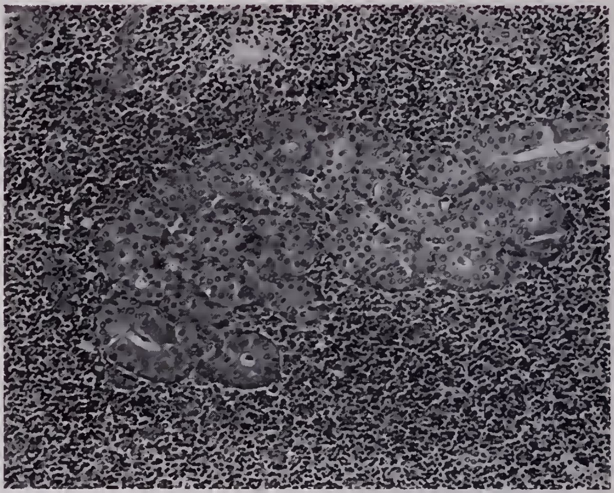

FIGURE 3

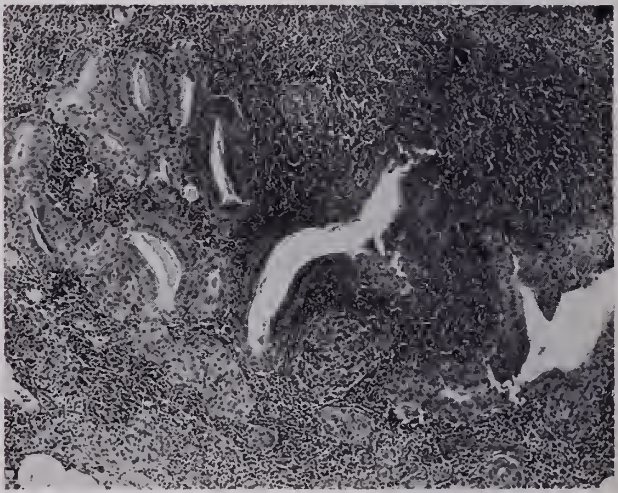

FIGURE 4

Figures 1 through 4 are representative of the ductal changes occurring in the progressive genesis of a Warthin's tumor. Figure I is the earliest stage of development with ductal elements enclaved in lymphoid tissue. This is followed by progressive hyperplasia (Figures 2-3) and then by dilation and intra-cystic papillation of the included ducts. Continued development of the lesion leads to the appearance illustrated in Figure 5.

relatively long duration before diagnosis. The average duration is three years and reports give a range of two weeks to 30 years.[3]

Despite reports of the tumor occurring in sites other than the parotid gland or its environs, Warthin's tumor is best considered as a lesion of the parotid gland, where it represents 6%[3] to 10%[10] of all parotid gland tumors; second in frequency of benign tumors only to the mixed tumors. It occurs most often in the lower pole of the gland, next to the angle of the mandible.[3] Because of the pathogenetic relationship described above, the tumor may arise in lymph nodes superficial or medial to the parotid gland. In 29 instances, the tumors were bilateral.[11]

Baum and Perzik[11] and Martin and Ehrlich[12] pointing out the intimate relationship of the tail of the parotid gland with the submaxillary gland, doubt the validity of the latter being reported as a primary site. A few unquestionably Warthin tumors have been noted in the lower lip[13, 14] and the palate[15] but doubts exist over the credibility of reported tumors in the oropharynx, hypopharynx, posterior nasal space, larynx, and thyroid gland.

The tumor is well-defined, soft or fluctuant or, if deep within the gland, firm to palpation. The average size is given as 3.6 cm. with a range of 1 to 8.5 cm. at the time of surgical removal.[3]

The preliminary clinical impression is mixed tumor when presenting in the salivary gland; branchial cyst if the presentation is below the gland; or lymphoma or lymphadenitis if the presenting site is lower in the neck.

Sialography is reportedly of little diagnostic value,[3, 12] since the displacement of the ducts indicates only a "space-occupying" mass. Aspiration biopsy and staining of the air-dried smears of the aspirates with May-Grunwald-Giemsa stain may permit a correct diagnosis in up to 83% of the cases,[16] but repeated biopsy may be required, and, in most cases, the patient will come to surgery anyway. The aspiration technique, however, has merit if the patient is opposed to surgical removal of the mass and malignancy needs to be excluded.

Treatment and Natural History

The Warthin tumor is particularly amenable to surgical removal. It is usually superficially placed,[3] and the facial nerve is rarely involved by the tumor. While well-defined, the tumor does not usually shell out easily, and this factor, with the desire not to spill the cyst contents, requires removal of adjacent gland.[11] Radiation may decrease the size of the lesion, but does not effect its regression[17, 18] and is not a substitute for surgical removal.

Recurrence rates are difficult to compute from reports because of insufficient follow-up. Six of 49 tumors encountered at Memorial Hospital manifested recurrence.[19] Incomplete excision, operative spillage of tumor contents, or more likely, growth from a new focus are held responsible. Multicentricity at first excision has been repeatedly noted.

Earlier reports of malignant Warthin's tumor have been refuted by many authors.[2, 3, 19, 20, 21] A case of **purported** malignant transformation with metastases has been reported by Ruebner and Bramhall.[20] However, an occult metastasizing thyroid carcinoma may be a more likely alternative. Two recent case reports, [21, 22] are more convincing. The patients, in both instances, had received irradiation to the neck, eight and 13 years earlier. In view of the fact that these two cases, of almost 600 cases of Warthin's tumor reported in the literature, are the only reasonably acceptable examples of malignancy certainly speaks for a **spontaneous** malignant propensity of such low order as to be non-existent. Involvement of the lymphoid component of the tumor by leukemia and by Hodgkin's disease has been reported.

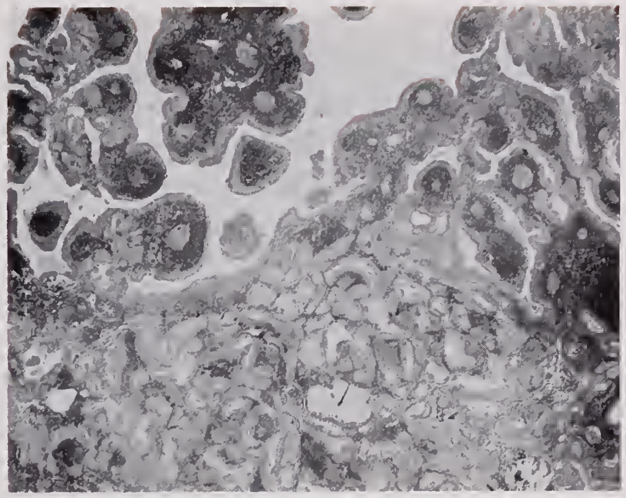

Figure 5: Fully developed papillary cystadenoma lymphomatosum in parotid gland.

Gross and Microscopic Features

The tumor is encapsulated and round or oval with a smooth or lobulated surface. It is usually cystic or semi-solid and compressible. A fluid of variable character but usually mucoid and brown-tinged, exudes from the cut surface. On section, multiple irregular cystic spaces with papillary projections are seen (Figure 5). Solid areas are grey and may manifest many small white nodules representing lymphoid follicles.

COHEN

CO-AUTHORS

Both Doctors Cohen and Batsakis are associated with the Department of Pathology, University of Michigan Medical School.

BATSAKIS

Microscopically, an epithelium having a tubulopapillary-cystic pattern is within lymphoid tissue or a lymph node. The latter has sinuses, lymph follicles, and usually, an embracing connective tissue capsule. Lymph node architecture may be so compressed and distorted by the epithelial components that sinuses may not be readily evident, but follicles are usually seen.

The epithelium is a double layer of oxyphilic, finely granular cells; an inner layer of round, cuboidal or polygonal cells and an outer zone of non-ciliated, tall columnar or clavate cells. The nuclei of the inner cells are vesicular, while those of the outer layer are usually pyknotic and situated uniformly toward the luminal surface. Not all the cells have the same intensity of staining with eosin; some are pale and distinctly granular while others are intensely red and homogeneous. Mucus or goblet cells may be interspersed in the epithelial layer. A piling-up of epithelium or focal areas of squamous metaplasia occasionally may be seen. A fine basement membrane separates the epithelium from the lymphoid tissue.

Phosphotungstic acid-hematoxylin stains on paraffin embedded tumors demonstrate numerous fine, blue-black granules (mitochondria[23]) in the cytoplasm of both cell types in the epithelial layer. Positive histochemical reactions for phosphatases, esterase and various mitochondrial enzymes are demonstrable, but not in significantly greater degree than in normal parotid gland ducts, though certain qualitative differences exist.

Ultrastructural examination of the epithelial cell cytoplasm finds it packed with mitochondria in both apical and basal areas. Many are in groups, enlarged, and manifest increased numbers of cristae.[24] The staining variation noted under the light microscope correlates with the numbers of mitochondria in the cells.[25]

The fluid within the cystic spaces of the tumor and into which papillae project has a homogeneous or finely granular eosinophilic appearance.

Summary

The papillary cystadenoma lymphomatosum (adenolymphoma), or Warthin's tumor, is a benign tumor of the parotid gland or its immediate environs. It is a neoplastic growth of cells of ductal inclusions in lymph nodes in or adjacent to the parotid gland and this accounts for its biphasic (epithelial and lymphoid) structure. The tumor is usually asymptomatic and occurs predominantly in males between the ages of 40 and 70 years. Surgical removal is the only acceptable modality of treatment.

Dietary Fat Restrictions and Atromid Therapy In Patients With Type II Familial Hyperlipoproteinemia

BY SHAFEEK S. SANBAR, M.D., PH.D.
ANDREW J. ZWEIFLER, M.D.
JAMES CONWAY, M.D., PH.D.
ALL OF ANN ARBOR

The three co-authors, Doctors Sanbar, Zweifler and Conway are all associated with the Department of Internal Medicine, University of Michigan Medical School.

The observation by Oliver[1-2] that Atromid* (clofibrate + androsterone) diminishes the concentration of serum cholesterol and triglyceride in patients with hypercholesterolemia and ischemic heart disease has been repeatedly confirmed.[3-5] Substantial reductions in serum lipids occur in patients with hypertriglyceridemia associated with an increased plasma concentration of very low density beta-lipoproteins.[4-7] On the other hand, patients with essential hypercholesterolemia or hyperbeta-lipoproteinemia, referred to recently as type II familial hyperlipoproteinemia,[8] in whom serum triglyceride concentrations are generally within the normal range respond relatively poorly to Atromid therapy alone.[4-7]

The following study depicts the effects of dietary fat restriction and Atromid therapy in 15 patients with type II familial hyperlipoproteinemia. Results show that the combination of diet and drug therapy produces substantial reductions in serum cholesterol in 60% of the patients.

Materials And Methods

Thirteen female and two male patients with type II hyperlipoproteinemia were studied (Table I). Their ages ranged from 6 to 58 years, and they all were normoglyceridemic. The average serum cholesterol concentration on no treatment and after a 12- to 16-hour fast was above 300 mg% on 2 successive determinations obtained two to four weeks apart. Paper electrophoresis of serum lipoproteins according to the modification of Lees and Hatch[9] demonstrated hyper-beta-lipoproteinemia. All patients had positive family history of hypercholesterolemia, and none of them showed either clinically or by laboratory tests evidence of a known cause for the hypercholesterolemia. Two patients (M.D. and D.D.) were mildly obese and two others (G.C. and P.A.) had diabetic relatives.

All patients were instructed in a diet with a total calorie content of 30-35 calories per kg body weight of which 15-20 per cent was fat, ⅔ unsaturated and low in cholesterol, 20 per cent was protein, and 60-65 per cent was carbohydrate. The patients were seen at monthly intervals in the fasting state for collection of blood and clinic evaluation. After a two-month-trial on diet alone, 1-2 g Atromid were given daily for two months, after which Atromid was withdrawn for two more months while the patients remained on the diet.

Fasting blood samples were analyzed for serum cholesterol and triglyceride by the methods of Connerty and co-workers[10] and Van Handel and Zilversmit,[11] respectively.

Results

Dietary fat restriction for two months produced only a slight decrease in the overall mean serum cholesterol concentration from pretreatment level (Table I), but five patients appeared to have reductions greater than 10%.

Atromid in addition to the diet produced further reductions of serum cholesterol in most of the patients. In nine of them, so-called "responders," serum cholesterol fell more than 15% after addition of Atromid. The mean serum cholesterol of the responders during "diet + Atromid" was respectively 26% and 21% below the mean values of "pretreatment" and "diet alone." Withdrawal of Atromid without change in diet resulted in a return of mean serum cholesterol to or towards the value observed initially on diet alone. In the remaining six patients, so-called "non-responders," there were only slight changes in serum cholesterol after diet and drug therapy. Also noted in Table I are the overall mean changes in serum cholesterol.

+ S.E.M.			7	23	22	30	22

* Dose of Atromid: 1 g/day for V.F., 1.5 g/day for C.C. and L.C., and 2 g/day for the rest of the patients.
** Greater than 10% decrease from pretreatment value.

Discussion

These data show that dietary fat restriction alone produces little change in serum cholesterol of patients with type II hyperlipoproteinema. On the other hand, Atromid in addition to the diet produces a substantial decrease in serum cholesterol in nine out of 15 patients studied; the remaining six patients have responded either poorly or not at all.

Earlier reports have indicated greater resistance of type II hyperlipoproteinemia patients to treatment with Atromid than we find here. Strisower[5] reported that in only two out of seven patients with this disorder did Atromid induce a substantial decrease in serum lipids and beta-lipoproteins. Howard and co-workers[4] also studied seven patients with this disorder. In two female patients Atromid produced a marked reduction in serum cholesterol, whereas in only one of five male patients was there a moderate response. Jepson and James[6] reported that Atromid therapy in 7 patients with idiopathic hypercholesterolemic xanthomatosis (presumably type II hyperlipoproteinemia) produced only a mean decrease of 9% in serum cholesterol, with a maximum response of 12.9%. The chief difference between the above three studies and our own is the very low fat diet which is mostly unsaturated. This may well be the reason for the greater responses in our patients.

Nevertheless, 40% of our patients with type II hyperlipoproteinemia responded either poorly or not at all to the combination for unknown reasons. One possibility is that 2 months of combined therapy is not long enough. Whether or not prolonged therapy with this combination may be of benefit to some of the "non-responders" is a matter for further study.

Summary

In patients with type II familial hyperlipoproteinemia dietary fat restriction for two months produced no significant reduction in concentration of serum cholesterol. Addition of Atromid (mixture of ethyl p-chlorophenoxyisobutyrate and androsterone) to the diet for two months produced greater than 20 per cent mean decrease in serum cholesterol in 60 per cent of the patients. Withdrawal of Atromid therapy without change in the diet resulted in a return of serum cholesterol to or towards the value observed initially on diet alone.

Clinical Experience With Haldol (Haloperidol) In Chronic Schizophrenics

ABSTRACT: Haldol (Haloperidol), a non-phenothiazine tranquilizer revealed its effectiveness on chronic schizophrenics who are withdrawn and hostile. The daily maintenance dosage varied from eight to twelve milligrams. Fifty percent of the patients developed neuromuscular reactions but they were adequately controlled with Trihexphenidyl (Artane). No hypo-tensive reaction, blood dyscrasias, liver dysfunction, photo-sensitivity and convulsions were observed in this study.

BY B. S. YUN, M.D.
OWOSSO

LAWRENCE BANNER, M.D.
C. B. OVERBEY, M.D.,
KALAMAZOO

Haldol (Haloperidol), a butyrophenone derivative is a non-phenothiazine tranquilizer and has been used in Europe for the past ten years, although it is a new drug in the United States. This study was designed to investigate the clinical effectiveness in Schizophrenics.

Subjects

The subjects for this study were twelve female hospitalized patients who were on the disturbed ward and under close supervision because of their unpredictable behavior. These patients were chronic schizophrenics who were withdrawn, agitated, aggressive, hostile, delusional, hallucinating patients who were refractory to previous drug therapy, mostly phenothiazines, and electro-convulsive therapy. Their ages ranged from 19 to 58 years. Their period of hospitalization varied from 4 to 25 years.

Methods

Preparation:

All previous medications were discontinued for three days before initial doses of Haldol were administered.

To rule out blood dyscrasias, kidney dysfunction and liver dysfunction, the following laboratory tests were conducted: complete blood count, urinalysis, liver function tests, e.g., total protein, cholesterol, serum bilirubin, transaminase (SGOT), alkaline phosphatase, thymol turbidity. These tests were performed before starting treatment and were repeated bi-weekly for three months.

Temperature, pulse, respiration, blood pressure and weight were taken three times weekly during the period of treatment.

Dosage:

Initial dosage of Haldol was 0.5 mgs. three times a day for five days. It was then increased to 1.0 mgs. four times a day for five days, and then 2.0 mgs. four times a day for three days. Thereafter, according to clinical response to the drug the dose in some cases was increased up to 20 mgs. daily, for a period of three months.

Maintenance dosage in our experience ranged from 8 mgs. to 12 mgs. per day.

Performance Evaluation:

The patients on the ward were observed daily by the physicians, registered nurses, and psychiatric attendant nurses, who then rated the results after the three months of drug therapy.

Results

Clinical improvement was divided into five categories: Remarkable improvement (+++); moderate improvement (++); slight improvement (+); unchanged (O); condition exacerbated (—).

The results of the drug therapy are indicated in Table I.

TABLE I

Ratings	No. of Patients	
Remarkable improvement (+++)	2	50%
Moderate improvement (++)	3	
Slight improvement (+)	1	
Unchanged (0)	3	
Condition exacerbated (—)	3	

Target symptoms:

It was our clinical observation that the drug was most effective on improving personal appearance, contact with reality, cooperation, sociability and eating habits, and on reducing hostility, paranoid ideation, and auditory hallucinations (Table II).

TABLE II

Target symptoms	No. of cases improved
Personal appearance	3
Hostility	2
Contact with reality	2
Paranoid ideation	2
Cooperation	1
Sociability	1
Auditory hallucinations	1
Eating habits	1

Among these patients who have shown improvement:

Patient E:

This patient had been continuously hospitalized for the past 25 years, mostly on the disturbed ward. She was extremely paranoid, hostile, destructive, and assaultive to nurses.

She has shown moderate improvement, become more cooperative, sociable, and is no longer delusional after the three month period of drug therapy. She was transferred to a better ward where she could enjoy more freedom with fewer restrictions. The patient has been performing well in occupational therapy and has started to work regularly, and is attending typing classes. She started having home visits up to two weeks duration, unusual for many years.

Patient C:

This patient was hospitalized continuously for the past six years and has been quite paranoid with religious preoccupation, and complained of voices annoying her constantly. In addition she was quite manneristic.

She has shown moderate improvement, no longer has delusions, and voices are gradually disappearing. She was transferred to the better ward and allowed to have week-end home visits on a regular basis.

Patient L:

She has been schizophrenic for the past five years, delusional, and preoccupied with sexual ideas. She would giggle and laugh with silly facial expression at times.

She has shown marked improvement and started to have week-end visits at the end of three month's drug therapy. Eventually she was transferred to the better ward. She has done well in occupational therapy and has shown more initiative in social interaction. After having a 30 day successful home visit she went home on convalescent status recently.

Side Effects

Nausea and vomiting: 58% of the patients had nausea and vomiting during the initial three days with the dosage of 0.5 mgs. administered three times a day. This side effect was controlled with anti-spasmodics (e.g. Donnatal). It was noted as the dosage was gradually increased the nausea and vomiting did not recur.

Neuromuscular reactions: 50% of the patients developed neuromuscular reactions: tremor (3 cases), muscular rigidity (2 cases), and akathisia (1 case).

TABLE III

Side effects	No. of cases	
Nausea and vomiting	7	58%
Tremor	3	50%
Muscular rigidity	2	
Akathisia	1	

Correlation of dosage and neuromuscular reactions revealed their presence at dosage levels as low as 4 mgs. per day. In some cases neuromuscular reactions did not occur until the dosage reached 16 mgs. per day. Neuromuscular reactions in all cases were controlled adequately by administering trihexyphenidyl (Artane) with the daily oral dosage varying between 2 mgs. three times a day and 2 mgs. four times a day.

Summary

Haldol (Haloperidol) appears to be a potent anti-psychotic tranquilizing drug, especially useful in treating chronic Schizophrenics who are not amenable to the phenothiazine group of drugs.

It is effective in improving personal appearance, contact with reality, sociability, eating habits, auditory hallucinations, and reducing hostility and paranoid ideation.

Maintenance dosage varied from 8 to 12 mgs. per day in the patients in this study.

YUN

CO-AUTHORS

Doctor Yun, formerly, was chief psychiatrist of the female receiving unit, of Kalamazoo State Hospital, presently Director of the Shiawassee County Community Mental Health Center, Owosso, Michigan; Doctor Banner is a staff psychiatrist, and Doctor Overbey is assistant superintendent of Kalamazoo State Hospital, Kalamazoo, Michigan.

BANNER

In regard to side effects, 58% of the patients developed nausea and vomiting, but as dosage was increased gradually these symptoms disappeared.

50% of the patients developed neuromuscular reactions but these were adequately controlled with trihexyphenidyl (Artane).

Hypotension, skin reactions, blood dyscrasias, liver dysfunction, and convulsions did not appear in any cases.

Undesirable weight gain was no problem with Haldol.

Acknowledgement

We express our gratitude to the McNeil Laboratories for their supply of the drug, and the nursing staff of the Female Receiving Unit, the Van Deusen Building, Pharmacy, and the Clinical Pathological Laboratory of the Kalamazoo State Hospital for their assistance in this study.

Sex Education Books Suggested

(Editor's Note: The following article includes an excellent bibliography to help physicians, educators, and others in their current efforts to work with Michigan communities, schools, PTA units, and others in the broad field of family life education and sex education).

The author, James S. Feurig, M.D., is medical director for the Health Center at Michigan State University and team physician for the Spartans.

The question of who should teach sex education to children and youth has always been a suppressed dilemma. It appears that the most effective program will involve comprehensive and well-organized teaching in the areas of: home, school and church.

The subject must be approached from the standpoints of: biology, heritage, morality and emotional pressure. A completely effective educational process will result in a fusion of these facets to the extent that the student will have a total concept of exactly what sex is.

It is too late to initially start sex education at the college level. This is something which has to be a part of child development and must be presented in the curriculum of elementary and secondary education. It should ideally be an extremely well-planned and step educational process which starts in kindergarten and progresses through high school. The teachers must have special training and be most competent. This should never be an area to "relegate" the teaching.

If the school, home, and church infinitely work together, the sex education program will be a very effective means to relate to young people the true meaning of sex and all of its implications.

What Is This Thing Called Health Education?

BY WM. H. CARLYON, PH.D.
CONSULTANT IN HEALTH AND FITNESS
AMERICAN MEDICAL ASSOCIATION

The low regard that many teachers and administrators have for health education is astonishing. This may seem paradoxical in light of the fact that health has been considered as a cardinal principle of education since 1918. But, health, like motherhood, is easy to be for without really understanding what is involved. In practice there often appears to be little relationship between our expressed devotion to the health of the school child and what we actually do about it.

Part of the problem is semantic. The term education itself refers to a complex abstraction about which people seldom communicate with precision, and even when they do they seldom agree. Add to this the similarly un-understood term "Health" and the opportunities for confusion multiply astronomically.

Perhaps things are not quite as bleak as all this. For instance most educators do know that there are three major areas of activity in school health: Health Services, Healthful Environment, and Health Education.

The first involves arrangements for such health services as periodic physical exams, immunizations, tuberculosis screening programs; and emergency care for the child who becomes ill or injured at school.

The second is concerned with providing a school environment which minimizes hazards and enhances the learning process. This includes a healthful emotional climate within the school, non-skid floors, accessible exits, proper heating and lighting, cafeteria sanitation.

These two areas, health services and healthful school environment are easy to visualize and comfortable for the educator to live with because they most often involve tangible, measureable objects and procedures, and are usually the primary responsibility of someone other than the classroom teacher.

The third area — health education — is very different because it **must** be an integral part of the instruction program. It is by nature intensely personal and practical to the student and is designed to help him learn how to live in a manner that will enhance health and discourage disease. The primary goal of health education is to prevent illness, not cure it.

TO FULLY APPRECIATE the importance of health education and its role in the prevention of illness it is necessary to be aware of the nature of the major threats to life and health in this country and how they have changed since the beginning of this century.

Very briefly the change has been from communicable diseases initiated by specific pathogens to chronic and degenerative disorders and accidents — conditions which often have no single cause but do stem from patterns of living adhered to over periods of many years.

It is, particularly, important to note that the methods used to bring the major communicable diseases under control have only limited application to most of our major health problems today. For example, even the most sophisticated sanitation and immunization measures or the most elaborate care and treatment facilities do relatively little to prevent **new** cases of cardiovascular disease, cancer, diabetes or mental illness.

Medical treatment in response to symptoms cannot always limit the incidence of most "modern" diseases. We cannot feel arteries hardening or fatty deposits building up in them, and it is a truism that the emotionally ill person is the last to admit that he needs help. When we respond to symptoms it is often too late to prevent serious illness.

FUTURE ADVANCES IN improving the health of the public will necessitate individual, voluntary, positive health behavior that leads to prevention of disease or its detection at a stage in which it can be most readily reversed or arrested.

Health education does have a vitally important role to play in early detection of disease but the fact remains that the only hope for primary prevention of many of our health problems is to help

---

This article was first presented by Doctor Carlyon as an address before the 1968 Northern Michigan Health Conference at Houghton.

young people establish early in life patterns of behavior which we know will enhance health and discourage disease. This is what school health education is all about.

WHAT ARE SOME of these behavior patterns? Here are a few that help to determine the state of a person's health at any given time.

1. How he has handled his feelings under stress since childhood.
2. What value he has placed upon himself as a person since childhood.
3. What level of physical activity he has maintained since childhood.
4. What kind of a diet and how much food he has eaten since childhood.
5. What level of immunity to pathogens he has maintained since childhood.
6. How wisely he has utilized available health products and services . . . since childhood.
7. How well he has avoided accidents since childhood.
8. How many cigarettes he has inhaled since childhood.

Behavior patterns such as these which make up individual life styles, begin forming very early, long before a child goes to school. They are motivated by information and feelings and are learned from others.

Although no amount or kind of "healthful living" can guarantee an illness-free life, we do know enough about physical and mental health and about human development to know that such behavior patterns individually and, most often, in combinations have much to do with whether an elementary school child will become:

1. A drug dependent hippie at 20.
2. A welfare dependent divorcee at 25.
3. A mental patient at 30.
4. A heart attack victim at 40.
5. Or will die of lung cancer at 50.

The purpose of health education is to help children establish early in life patterns of living which we know will discourage just such tragedies and in the process allow them to fulfill themselves to the maximum of their capacities.

IN THE FACE OF all this that we know, it is inconceivable that we should continue to place such a low value upon health education in our schools as we have in the past. Learning how to live a healthful and satisfying life is every bit as important as learning how to add, or being able to recite the parts of speech, or knowing the major exports from Brazil.

It is not that the rest of the curriculum is unimportant. Everything a student learns at school can contribute to his overall well being. But, nothing is **more** important than learning how to live a healthful life.

There is a lot of activity labeled health education going on in schools and colleges across the country. Some of it is excellent. But a great deal of what is so labeled isn't health education at all. It is illness education — because it is being used as an antidote for health problems that have already developed, and such problems often turn out to be the dramatic ones which scare the daylights out of the adult community — sexual misconduct, unwed pregnancy, venereal disease, drug dabbling, and reckless driving.

CERTAINLY WE ARE IN favor of doing whatever we can to cope with such problems; but it is just as important to help young children learn to deal constructively with their impulses to aggression and gratification, as it is to bring a narcotics agent into the classroom in an effort to frighten teenagers out of using drugs. It is just as important to help children gain a knowledgeable awareness of their evolving sexuality as it is to have a crash sex education program in junior high in response to a pregnancy epidemic.

The story of health education in our schools has often been one of too little and too late. Unfortunately it is getting later and later and we still aren't doing enough about it.

TOO LITTLE, TOO LATE has also been a pattern in American life, particularly, regarding

AUTHOR
WM. H. CARLYON, M.D.

our health and social problems. Somehow we find it easy to accept the old myth that we can solve any problem that develops through application of good old American ingenuity and know-how. Science and medicine have done much to alleviate suffering and to prolong life and there will continue to be exciting breakthroughs in the health field. But much of what has been discovered in recent years supports the thesis that many of our major health problems are due to lives poorly lived and that you cannot change a lifetime of destructive health behavior with a magic pill or gadget. We cannot afford to wait until we can get a "safe" cigarette from the tobacco companies or a guaranteed heart transplant in our local communities. It is tragic if we pass blind faith in science and technology on to our children.

All of our future health problems exist, potentially, in our present school populations. The nature of these problems will be determined in large part by how these students live their lives during the next 20-30 years. If we really want to do something about these future health problems the time to start is now, and the place to begin is our schools.

We need comprehensive, balanced health programs in every school, including adequate health services, healthful school environment, and planned health education experiences from kindergarten through college. It would seem logical to place a special emphasis on the elementary schools where we can reach children at a time when their attitudes and life styles are still in formation.

NONE OF WHAT HAS been said here is intended to pose health education as a panacea. It isn't. But health education can be a major force in helping young people learn how to live constructively and healthfully with the demands of an environment which often appears to stretch the limits of human adaptibility.

The evidence in support of sound school health education is overwhelming.

It is time for action.

Hypercatabolic and Non-Oligurie Renal Insufficiency

BY J. C. ROSENBERG, M.D.
DETROIT

(Editor's Note: Following is an abstract of a paper on "A Study of Hypercatabolic Non-Oliguric Renal Failure in Man," given by Jerry C. Rosenberg, M.D., at a meeting of the Detroit Surgical Association. Doctor Rosenberg is associated in the Department of Surgery at Wayne State University Medical School.)

Postoperative and post-traumatic patients with renal insufficiency have twice the mortality of medical patients with anuria. In an attempt to understand the reasons for this disparity in prognosis, we have studied, in detail, 6 patients with renal failure; in each instance this complication followed a major operation or massive trauma and fell into the category of either hypercatabolic (daily increase in blood urea greater than 60 mg/100 ml) or non-oliguric (elevation of blood urea and creatinine despite normal daily urine volumes) renal insufficiency. Hypercatabolic oliguric renal failure and non-oliguric renal failure result from a reduction in renal blood flow.

The severity of the tubular damage and the extent of the associated catabolic state determines which of the aforementioned syndromes will be produced. Infection and/or the presence of necrotic tissue was responsible for the hypercatabolic state in all of the patients. Previous renal disease was present in 2 of the 6 patients. From a therapeutic point of view, it is essential to differentiate the varieties of renal insufficiency. Failure to recognize these syndromes, and therapy which was too conservative, was responsible for the high mortality of 33%.

Adequate treatment requires the early onset of continuous peritoneal dialysis or the insertion of an external Scribner shunt and daily hemodialysis. Simultaneously, necrotic or infected tissue must be excised or physiologically eliminated by hypothermia.

Wine in Medicine

BY ARMANDO R. FAVAZZA, M.D.
ANN ARBOR
AUTHOR

Undoubtedly there is something basically majestic in wine, like blood or bread or lentils. Priests have consecrated it, poets sung paeons to it, philosophers praised it, physicians prescribed it. Perhaps it is merely coincidence, but the countries which have given art and "joi de vivre" to the world also include wine as a staple of life.

There are more than enough historical admonitions exhorting the use of wine as a medicine. In the Hebraic Talmud, wine is called "the foremost of all medicines." The physician Maimonides wrote about wine, "It contains much good and light nourishment. It is rapidly digested and helps to digest other foods. It also removes the superfluities from the pores of the flesh and excretes urine and perspiration."

The Book of Proverbs states, "Give strong drink unto him that is ready to perish, and wine unto those of heavy hearts." And St. Paul advised Timothy to, "Drink no longer water, but use a little wine for thy stomach's sake and thine often infirmities."

Hippocrates wrote, "No wounds should be moistened with anything except wine unless the wound is in a joint." Galen used wine to bathe the intestines of wounded gladiators before stuffing them back into the abdomen in order to prevent infection.

During the Renaissance wine was used as a rinse to decrease dental caries, and also as a stimulant for the liver and pancreas.

Pasteur declared that wine was ". . . the most healthful, the most hygienic of beverages." Wine was added to water and prescribed in France and Austria to combat typhus and cholera.

Pharmacology

The pharmacological properties of wine are far more varied than those produced by alcohol alone. Table wines average about 13 percent alcohol and fortified wines (sherry, port) about 20 percent alcohol. The pH of wine is 3.2, approximately that of gastric secretions. Wine alcohol is more slowly absorbed from the gastrointestinal tract than straight alcohol or alcohol and water, thus a great quantity must be drunk to cause a high alcohol blood level. Being a natural tranquilizer it has few side effects and may be considered as a mild hypnotic-sedative.

Because of their tartrate content, white wines serve as mild diuretics. The high K/Na ratio is favorable for the cardio-vascular renal system.[1]

The anthrocyanins, which contribute to the color of wine, are antibiotic in low concentrations and are especially effective against shigella, salmonella and typhoid.[2]

Cyanidol, which occurs as 1-3000 parts per million in wine, may act to reduce hypercholesterolemia.[3]

Wine also contains amounts of the vitamin P group (bioflavenoids) in sufficient quantity to be effective in maintaining the integrity of capillary structure.[4] Almost all the B vitamins are present in great enough quantity so as to be considered as a supplemental source.

Due to enzymes found in wines it has been reported that in some malabsorption syndromes, white wine with meals may restore fat absorption to normal.[5] The ferrous iron in wine is, of course, easily absorbed.

An average glass of wine contains about 95 calories, dry wines having lower sugar content. Insulin is not required to metabolize the alcohol in wine, and wines have been prescribed as part of a diabetic diet.[6]

It has been recently reported that one-half a liter of wine will lower intraocular pressure significantly in patients with glaucoma.[7]

Contraindications

Wine should not be prescribed for patients with the following conditions:

1. Alcoholism — except under controlled conditions when wine may deliberately substitute for crasser and more potent alcoholic beverages.
2. Specific allergy to wine.

The author, Doctor Favazza is a resident in the Department of Psychiatry, University of Michigan Medical School; and president of the Physician's Wine Appreciation Society of Greater Detroit.

3. Esophagitis or gastritis.
4. Pancreatitis.
5. Genito-urinary tract infections.
6. Prostatitis or benign prostatic hypertrophy.

Indications

While we might try to fool ourselves about the important pharmacological effects of wine there are more potent and specific agents we can use. Wine is a fine and neglected auxiliary nostrum, especially in elderly patients.

A glass of wine with a meal will make a drunkard of no one and it may help to alleviate minor tensions and may "promote geniality, conviviality, companionship, interest in others, appreciation of the environment, and overall bodily comfort."[8]

In a loosely-controlled large California study the authors conclude: "Whatever the physiological or psychological mechanisms involved, it seems obvious that the inclusion of small amounts of wine in hospital diets resulted in a substantial relaxation of tensions, indicated by a substantially lower number of complaints per patient. The use of wine with meals not only improved the palatability of the food with which it was served, but appeared to make the coffee taste better, reduce the unpleasantness of hospital smells, make the room seem less noisy, increase the courtesy and efficiency of receptionists and carriers, and generally improve the rapport between the patients and the physicians, nurses and technicians."[9]

A glass of port at bedtime may combat mild insomnia. An afternoon glass of sherry is a genteel custom to open the appetite, combat boredom and lead to relaxation. Sherry has also been prescribed to combat premenstrual tension due to its mild diuretic and tranquillizing properties. Champagne is a favorite European remedy for post-partum "blues."

Wine given to a hospitalized patient may do wonders for the hospital's image as a place where one comes for living and not for dying. Although wine is a staple of life throughout the world, in America it stirs up middle-class images of gracious living. Osler called wine "the milk of old age."[10] As our methods and mentalities become more mechanized, a glass of wine may be a thoughtful gesture, a touch of civility, an inexpensive way of expressing care and kindness.

It is not necessary to prescribe high quality, high-priced wines. Michigan is one of the nation's largest wine producing states and its wines, when bought in bulk, are negligible in price. Bulk wines are cheaper than fruit and vegetable juices and may be good replacements on the hospital evening cart!

Editorial Comment:

Whether one is a teetotaler or not, many physicians will certainly enjoy reading this brief description of the use of wine in medicine. One could draw the reader's attention especially to its value as a psychological boost to the patient as herein described. (John W. Moses, M.D.)

Four-Year MSU Medical School Supported in Annual Address by Harris

A proposal that citizens, concerned with the supply of doctors in Michigan, help complete a four-year medical school at Michigan State University was made by the president of the Michigan State Medical Society at the 1968 Annual Session.

President B. M. Harris, M.D., Ypsilanti, suggested the "formation of citizens committees in Michigan communities to help support the efforts to graduate future doctors at MSU."

Doctor Harris declared, "The State Medical Society should strongly urge the development of citizen groups to augment physician appeals to the state legislature to provide the support necessary to expand the two-year MSU medical school to the full four years."

The State Board of Education has recommended the expansion of the two-year MSU school to a MD degree granting institution, but the legislature, to date, has not voted the necessary funds for expansion.

Greater use of community leaders to help increase the number of doctors trained in Michigan was advocated by Doctor Harris. In part, he said, "Medicine would like to ask the help of intelligent and dedicated laymen to aid in increasing the quantity and quality of medical care we can offer our patients."

"The doctors of medicine," reviewed Doctor Harris, "have endorsed for several years the expansion of the two-year MSU school to become the third medical school in Michigan."

Every effort must be attempted to close the gap between public demand for medical services and the number of Michigan doctors of medicine, Doctor Harris said. "Our greatest prospect lies in funding by the legislature to expand the medical schools at the University of Michigan and Wayne State University and to obtain a four-year medical school at MSU."

Doctor Harris pointed to a recent Brookings Institute Report on the doctor shortage. The Institute predicts that the demands for medical services in the 1965-75 decade will increase between 22 and 26 per cent, while the supply of physicians will increase by less than 20 per cent.

B. M. HARRIS, M.D.

In his annual report, Doctor Harris said, "Although there is a strong basic science program at Michigan State and a new life sciences building, the present great need there is financial support. More state funds must be appropriated by the state legislature to develop the clinical areas of the medical school curriculum."

MSU began its two-year school in the fall of 1966.

Photo Highlights From Annual Session

OTHER PHOTOS APPEARED IN OCTOBER EXTRA; MORE NEXT MONTH

Information about the seriousness of health quackery was stressed in comments to the Michigan State Medical Assistants Society convention by Brock E. Brush, M.D., left, Detroit, Chairman of the MSMS Public Relations Committee, and James J. Lightbody, M.D., MSMS President.

Harry Dowling, M.D., right, of Chicago, who gave a speech about "Government, Medicine and Drugs" at one of the Annual Session Luncheons, visits with A. Martin Lerner, M.D., Detroit, a member of the Annual Session Program Committee.

James J. Lightbody, M.D., receives a Past Speakers Pin from Speaker James B. Blodgett, M.D., as one of the special ceremonies during the Annual Session. Doctor Lightbody had served as Speaker for eight years through the 1967 session, when he was chosen as President-Elect.

State Auxiliary officers were part of the receiving line for the Presidents Party during the Annual Session in the Sheraton-Cadillac Grand Ballroom. The couple at left is Dr. and Mrs. Earl Weston, Detroit, and the couple at the right is Dr. and Mrs. W. G. Gamble, Jr., of Bay City. Mrs. Weston is the new President of the Woman's Auxiliary to MSMS for 1968-69, and Mrs. Gamble is the outgoing President.

Table signs marked the locations of the county society delegations at the House of Delegates meeting of the Michigan State Medical Assistants Society annual meeting at the Pontchartrain Hotel.

Miss Helen A. Schulte, who serves as staff assistant for many of the MSMS scientific committees, was honored by the House of Delegates for 25 years of loyal, efficient service. Robert J. Mason, M.D., pointed out that Miss Schulte is the second MSMS employee to complete a quarter of a century of employment — the other was William J. Burns, who retired several years ago as the executive director.

Robert J. Roney, right, MSMS controller, receives warm congratulations of Robert J. Mason, M.D., when the House of Delegates honored Mr. Roney for 20 years of loyal, efficient service.

George L. Reno, M.D., Detroit, presided at the 1968 MDPAC Breakfast in Detroit during the Annual Session. Doctor Reno, Secretary of the Wayne County Medical Society, is a member of the MDPAC Board of Directors.

In photo below, James J. Lightbody, M.D., Detroit, gives his message as president-elect to the 1968 House of Delegates.

Every year during the MSMS Annual Session, the former leaders of the State Society get together for a social evening and the chance to discuss projects they helped carry out for MSMS. The 1968 dinner meeting was held at the Detroit Athletic Club.

Past MSMS Officers In the Camera Eye

AT LEFT — D. Bruce Wiley, M.D., right, formerly of Utica and now of Lansing, former Chairman and Secretary of The MSMS Council, exchanges comments with Gerald D. Dorman, M.D., New York City, President-Elect of the AMA.

Three former MSMS officers visit with Gerald D. Dorman, M.D., AMA President-Elect, at the Past Officers Dinner. Left to right are H. R. Carstens, M.D., Detroit, who was speaker in 1928-29; Doctor Dorman; L. W. Hull, M.D., Detroit, President in 1953-54; and Luther R. Leader, M.D., Royal Oak, President in 1965-66.

Three past presidents are caught in the middle of a good story — Left to right are Kenneth H. Johnson, M.D., Lansing, President, 1960-61; George W. Slagle, M.D., Battle Creek, President, 1957-58; and G. B. Saltonstall, M.D., Charlevoix, President, 1958-59. Doctor Johnson currently serves as the MSMS Secretary.

C. Allen Payne, M.D., left, Grand Rapids, President during 1966-67, tickles the funny bone of Hugh W. Brenneman, Executive Director.

In photo above at left, B. M. Harris, M.D., visits with two visiting dignitaries. Newton DuPuy, M.D., President of the Illinois State Medical Society, is center, and Robert Howard, M.D., Past President of the Ohio State Medical Society, is at right.

Orlen J. Johnson, M.D., right, Bay City, President of MSMS during 1963-64, talks about health planning with George W. Slagle, M.D., Battle Creek, President during 1957-58. Between the two in the background is Otto B. Beck, M.D., Birmingham, President during 1951-52.

BELOW — Otto K. Engelke, M.D., left, Ann Arbor, MSMS President in 1961-62, discusses current medical issues with Oscar D. Stryker, M.D., Mt. Clemens, former Speaker of the MSMS House of Delegates in 1940-41 and 1941-42.

MSMS Offers Advice on Transplants To State Legislative Committee

The Michigan State Medical Society has pledged its complete support to the new Michigan Legislative Committee on Transplants of Human Body Parts.

The medical society has informed the committee chairman, Senator N. Lorraine Beebe, that its members who are well informed in this field are available as resource persons, and that its extensive files of technical reports and scientific papers are at the disposal of the committee.

When the committee conferred in Lansing, October 9, C. Allen Payne, M.D., of Grand Rapids, a past president of the state medical society, was present as an invited resource expert.

Doctor Payne and Senator Beebe attended a conference in Washington, D.C., September 30 on "Medical-Legal Issues Relating to Tissue Transplantation." The meeting was sponsored by the National Research Council.

MSMS also helped arrange for Senator Basil Brown, who introduced the resolution creating the committee, to attend a special American Medical Association-sponsored program in June on "The Limits of Medical Responsibility in the Prolongation of Life."

The Michigan legislature on January 11 adopted a resolution to create the Special Committee on Transplants of Human Body Parts. The resolution, introduced by Senator Basil Brown, also outlined the broad functions of the committee in preparation of a report to the 1969 legislature.

The special committee has been appointed to include five senators and five representatives, with Senator N. Lorraine Beebe as chairman and Representative William L. Jowett as vice-chairman.

The legislative resolution praised the recent successes of surgical transplants of human body parts for bringing "new hope for all in the never ending battle against disease and accidents," and pointed out "that the same successes raise new legal and moral questions for which answers do not presently exist."

The resolution declared further, "it is in the public interest that these questions be answered to the end that such research can be continued."

The special joint-legislative committee has been charged, "to study all phases of the subjects of transplants of human body parts and to report its findings and recommendations to the 1969 legislature."

The membership of the Human Transplant Committee includes the following State Senators—N. Lorraine Beebe, Chairman, Harry A. DeMaso, James G. Fleming, Basil W. Brown and Roger E. Craig; and State Representatives William L. Jowett, Vice-Chairman; Peter Kok, Dale Kildee, Daniel S. Cooper and Thomas L. Brown.

Attorney General Frank Kelley (in a "Know Your Michigan Law" newspaper column) on February 19, 1968, declared in part:

"Fortunately the Michigan legislature has provided answers to many of these questions (about transplants) by passing Act 82, of the Public Acts of 1958, as amended. The legislation authorizes and regulates the donating of all or any part of the human anatomy for various purposes."

Attorney General Kelley in May called for action to give firmer legal foundation for heart transplant operations in Michigan.

He declared that "the major task of the law is to facilitate the supply of anatomical parts needed for medical education and transplant purposes."

Attorney General Kelley said, "If science can make the startling breakthroughs that it has in the transplant area, with the difficult problems it was required to surmount, certainly we can make the necessary efforts to make the law a more helpful tool in this life-saving process. We certainly have the obligation to try."

"New legislation providing more definite rules is necessary," Attorney General Kelley said, "if we are to facilitate transplants through donation by the deceased's survivors."

He reported that there is no Michigan legislation regulating consent of the deceased's survivors to removal operation for transplant purposes. He pointed out, "however, a criminal statute which makes it a felony to mutilate any portion of a dead body without lawful authorization does set some limits."

The Attorney General indicated that possible new legislation should be "passed after lawyers, doctors and other concerned and informed citizens have played a part in giving it content."

Attorney General Kelley suggested the law should protect the doctors involved in removal operations against legal liability, and the law should constantly strive to provide the maximum feasible amount of certainty regarding the legal rights of all concerned."

Attorney General Kelley said, "Michigan law, fortunately, affords licensed medical practitioners and medical and educational institutions protection against civil liability for removing organs given as provided in the act where the gift has not been revoked."

Available as a guide for the Michigan legislative committee and the Michigan legislature as it considers possible new laws is the new "Uniform Anatomical Gift Act." This act was developed by the National Conference of Commissioners on Uniform State Laws and then endorsed by the American Bar Association.

The National Conference of Commissioners on July 30 gave approval to the uniform act, which it reports was "designed to facilitate donations and use of organs and other tissues for transplantation and other medical purposes."

The American Bar Association House of Delegates in August approved the uniform act and urged adoption by the state legislatures.

The proposed act will be distributed to all state legislatures as a nationwide model.

The matter of transplants also is under discussion in Congress. Senator Walter F. Mondale in 1967 proposed a Commission on Health, Science and Society to study transplants and many other matters which he called "profound and complex questions of law, ethics, and public policy."

11 Michigan Physicians Honored For Volunteer Service in Vietnam

Eleven Michigan doctors of medicine who have served as volunteers in Vietnam this past year were honored at the 1968 Michigan State Medical Society meeting in Detroit.

Plaques for meritorious service were presented the doctors by Gerald D. Dorman, M.D., New York City, president-elect of the AMA.

The Michigan physicians, who each served two-month stretches for a total of 22 months, are:

Daniel D. Chapman, M.D., Owosso;
J. Colin Elliott, M.D., Buchanan;
Joseph A. Grady, M.D., Detroit;
Seymour Krevsky, M.D., Detroit
Armand M. LaSorsa, M.D., Manistique;
Donald Lipsey, M.D., Durand
Adrian J. Neerken, M.D., Kalamazoo;
Leonard M. Pickering, M.D., Southgate;
Henry C. Scharnweber, M.D., Midland;
Roger A. Scholten, M.D., Kalamazoo; and
Daniel B. White, M.D., Birmingham

The awards were "Certificates for Humanitarian Service," and recognized the doctors of medicine "for treating the ill and injured during his medical mission."

The physicians and their wives were guests of MSMS for dinner before the House of Delegates session. Hira Branch, M.D., Flint, chairman of the MSMS International Medicine Committee, was the host.

Three Michigan physicians were honored a year ago. Since then the medical society has conducted a more active educational effort to get more Michigan doctors to volunteer for two months.

The AMA Physician Volunteers for Vietnam Program began three years ago and has sent more than 500 doctors to help the civilians in South Vietnam.

The map of South Vietnam shows the locations of physicians serving on AMA Volunteers Project. The current locations are marked with grey seal-shapes and former locations are in outline seal-shapes.

ACTIVITIES, PROJECTS

U-M Creativity Symposium Open To All Dec. 1

Michigan physicians are invited to participate in the "Symposium on Creativity, Conformity and Concepts of the 20th Century Adolescent," December 1 at the Sheraton Motor Inn in Ann Arbor.

A banquet, at 6:00 p.m., will feature an address, "Changes in Society's Procedures for Handling Juvenile Delinquency," by the Honorable Orman W. Ketcham, Judge, Juvenile Court of the District of Columbia.

All persons attending the symposium are invited to this banquet. Requests for banquet tickets should be forwarded together with personal checks ($5.00) made payable to "Symposium on Adolescents" and mailed to Department of Postgraduate Medicine, W5610 University Hospital, Ann Arbor, Michigan 48104.

The symposium is open to all physicians, their wives, and professionally allied colleagues. Members of the law profession who are closely concerned with medicolegal problems are also cordially invited. No registration or other fees are required for the lectures; however, because of seating space limitations, only those holding complimentary admission tickets can be accommodated. Further information and ticket applications will be sent to Michigan physicians or may be obtained by addressing requests to: Harry A. Towsley, M.D., Chairman, Department of Postgraduate Medicine, University of Michigan Medical Center, W5610 University Hospital, Ann Arbor, Michigan 48104.

The conference will be sponsored by the U-M Departments of Psychiatry and Postgraduate Medicine, the Michigan Society of Neurology and Psychiatry, and MSMS.

The symposium will explore the more recent trends in the general attitudes of youth, their sex mores, value systems, and psychological approaches to the search for identity. The entire program is designed for the benefit of the practicing physician who is now increasingly expected to deal firsthand with these problems.

The symposium has been made possible by an educational grant-in-aid from and with the assistance of Geigy Pharmaceuticals, Division of Geigy Chemical Corporation, Ardsley, New York.

The first speaker at 1:15 will be Raymond W. Waggoner, M.D., U-M, on "The Adolescent Patient," followed by E. J. Hornick, M.D., Albert Einstein College of Medicine, on "Parentage and Parenthood Versus Creative Adolescent Turmoil."

Other afternoon speakers will include Fritz Reidl, Ph.D., WSU, on "Rebellious Youth and the Futility Syndrome;" Daniel Offer, M.D., Michael Reese Hospital, on "Sexual Problems Faced by Today's Normal Adolescent Girls;" and Dave L. Farnsworth, M.D., Harvard University, on "Adolescents' Abuse of Illicit Drugs; Facts Versus Fallacies."

MARMP GETS $1,652,273 GRANT

Albert E. Heustis, M.D., executive of the Michigan Association of Regional Medical Programs, has announced that MARMP organization has been awarded a $1,652,273 grant by the U.S. Public Health Service for educational programs and other studies to combat heart disease, cancer, stroke and related diseases.

Part of the grant will support the central coordinating staff in Heustis' office. The grant will also be used to finance projects designed to improve care of patients who have the diseases and to support planning staffs at three state universities and the State Public Health Department.

SEEK BIOMED PAPERS FOR U-M PROGRAMS

Interested physicians are invited to submit papers for the 7th National Biomedical Sciences Instrumentation Symposium, May 19-21 at the University of Michigan. Abstracts must be received no later than December 15 by Ernest E. Sellers, Host Chairman, Box 618, Ann Arbor 48107.

The conference, "Imagery in Medicine," will be sponsored by the University of Michigan and the ISA.

For more news about Coming Events read the four blue pages in the middle of this issue and every issue of *Michigan Medicine*; and watch for the *News Extra* during the middle of each month.

Walt Appointed Associate Dean; Other Changes

Several administrative appointments have been announced by Ernest Gardner, M.D., Dean of The Wayne State University Medical School.

Alexander J. Walt, M.D., since 1964 Assistant Dean at the medical school, has been appointed Associate Dean. He holds The Grover C. Penberthy Chair in Surgery.

Lawrence Power, M.D., who joined the medical faculty in 1965 as associate professor of internal medicine, has been named Assistant Dean. In his new position, Doctor Power will be responsible for the clinical implementation of the school's new curriculum. He will also represent Wayne State University as co-director of the Institute of Gerontology, serving with a representative of the University of Michigan.

Windsor S. Davies, M.D., clinical professor of ophthalmology and a member of the faculty since 1949, has been appointed Acting Chairman of the Department of Ophthalmology, filling the vacancy created by the retirement of Albert D. Ruedemann, M.D.

Ralph G. Smith, M.D., professor of occupational and environmental health and member of the faculty since 1955, has been appointed Acting Chairman of his department. Arthur J. Vorwald, M.D., chairman since 1954, has taken a long-term medical leave.

Ben Rubenstein, Ph.D., Director of Admissions and Student Advisement, is on sabbatical until July 1, 1969 to conduct research on admission policies and practices. Harry Maisel, M.D., professor of anatomy, has been named Acting Director.

MRS. GAMBLE NAMED TO REGIONAL POST

Mrs. W. G. Gamble, Jr., immediate past president of the Woman's Auxiliary to MSMS, has been appointed North Central Regional Safety and Disaster Preparedness Chairman for the National Auxiliary.

Mrs. Gamble, who will serve 12 states, participated in the North Central Regional Workshops, October 14-15 in St. Louis.

The annual fall conference of the national Woman's Auxiliary in Chicago in September was attended by Mrs. Earl Weston, current Michigan president; Mrs. Edward S. Maxim, president-elect, and Mrs. Gamble.

May 21 — Annual Muscle Symposium, Wayne County Medical Auditorium, Detroit

TB SOCIETY PLANS CHRISTMAS SEAL SALE

Plans are being advanced by the Michigan Tuberculosis and Respiratory Disease Association for the 1968 Christmas Seal sale.

Association officers point out that most people associate Christmas Seals with the fight against tuberculosis, but many are unaware of the Christmas Seals' role in fighting other respiratory diseases such as emphysema, chronic bronchitis and asthma. In Michigan, emphysema deaths alone have risen from 228 in 1957 to 1045 in 1967.

In tuberculosis control much effort is placed in research, detection and education. Contributions also support the implementing of breathing exercise courses for asthmatic children and persons suffering from respiratory ailments, smoking education in our schools and smoking withdrawal clinics, and tuberculin skin testing and chest X-ray programs.

PROMOTED BY DOW

Charles W. Hinman, Ph.D., has been named by Dow Chemical Company to the newly-created position of assistant director of research for the life sciences. He has been with Dow since he received his doctorate in organic biochemistry from the University of Illinois in 1954.

26 Doctors Get MSMS Pins for 50 Years Service

Every year Michigan doctors who have completed 25 years of service receive a coveted pin before the House of Delegates.

This year, 26 Michigan physicians were eligible for the "50-year Service Pins." Nine were present to receive the Michigan award in person before the delegates. The other pins will be mailed.

The honorees included one past president — Edward F. Sladek, M.D., of Traverse City, and two former MSMS Council members — W. C. C. Cole, Sr., M.D., formerly of Detroit, and John T. P. Wickliffe, M.D., formerly of Calumet, both in California now.

The complete list of 50-year men are: Edward F. Sladek, M.D., Traverse City; Lloyd C. Harvie, M.D., Saginaw; M. S. Hurth, M.D., Ingham; W. B. Lewis, M.D., Battle Creek; Garnet G. Stonehouse, M.D., Grand Rapids; William V. VanderVoort, M.D., Hastings; Karm C. Kerwell, M.D., Stephenson; Alton R. Marsh, M.D., Dearborn; Sol M. Lewis, M.D., Ferndale; Joseph A. Kasper, M.D., Grosse Pointe Park; Elden C. Baumgarten, M.D., Grosse Pointe Woods; and Fred O. Lepley, M.D., Grosse Pointe Woods; Alfred H. Whittaker, M.D., Grosse Pointe; from Detroit — Clyde K. Hasley, M.D.; Arthur B. Norton, M.D.; Robert L. Novy, M.D.; Harold F. Raynor, M.D.; John B. Rieger, M.D.; Isaac S. Schembeck, M.D.; James M. Stanton, M.D.; Milton D. Vokes, M.D.; Ray S. Dixon, M.D.; William E. Hilton, M.D.; and also John T. P. Wickliffe, M.D., formerly of Calumet and now of Escondido, California; A. M. Giddings, M.D., formerly of Calhoun County, now of St. Mary's, Ohio; Wyman C. C. Cole, M.D., formerly of Detroit, now of Walnut Creek, California.

AMA Offers Folders About Drug Abuses

Because of the rising incidence of drug abuse in the United States, especially among young people, the American Medical Association has published five related pamphlets, "Amphetamines," "Barbiturates," "Marijuana," "LSD," and "Glue Sniffing."

Written originally for the 1968 Community Health Week program on drug abuse, the one-page pamphlets answer many of the questions frequently asked about this growing problem. In addition to describing the effects of these dangerous substances on the body, each pamphlet stresses the hazards of experimentation, the psychological effects on the users and the legal controls.

Review copies are available from the AMA's Department of Health Education. Quantity copies are available from Order Handling at 15 cents each; 50-99 copies, 14 cents each; 100-499 copies, 12 cents each; 500-999 copies, 10 cents each and 1,000 or more copies, 8 cents each.

CURRICULUM CHANGED

WSU Freshmen Get Introduction To Patient Care

A redesigned medical curriculum at Wayne State University went into effect on September 30. Ernest Gardner, M.D., dean of the School of Medicine, reports the 1968 entering freshmen, number 130, will be the first under the new program.

To the freshmen, the new curriculum means getting an introduction to problems involving patient care during the first year, rather than in the third year. They will study social and behavioral sciences, stressing the changing social and community roles of today's physicians. An integrated basic science curriculum in human biology will be taught by the departments of anatomy, biochemistry and physiology.

Dean Gardner said, "The new undergraduate program places emphasis on relating basic science knowledge to patient care. Flexibility through expanded electives will enable preparation for a variety of careers within the general divisions of private practice, academic medicine and research."

During their second year at the medical school, this year's freshmen will study physiology, pharmacology, pathology, microbiology, biostatistics, epidemiology, special topics in biochemistry and psychiatry, plus an intensive course in obtaining medical histories and performing physical examinations. Appreciation of medical history, culture and heritage will also be stressed.

Revision of the third year curriculum calls for clinical core courses in internal medicine and related specialties, surgery and related specialties, gynecology and obstetrics, pediatrics, psychiatry, and family and community medicine. Elective studies will make up the senior schedule.

Students who are now sophomores at the medical school will study phased-in portions of the new curriculum. Upper classmen will continue with much of the former program, laced with more relaxed policies on electives.

New House-Introduced Laws Bearing on Medicine Described

BY HERBERT MEHLER
OF THE MSMS STAFF

Community Mental Health Services Law

Public Act 265 (House Bill 2294) amends Act 54, the Community Mental Health Services Act, so that the legality of a city-county board in Wayne County is no longer in question, and writes a new definition of eligible mental health programs more in keeping with the concept of comprehensive services. It provides that community clinics must come under the local mental health board by contract or direct administration within four years and gives the Director of the Department of Mental Health authority to extend this period for a reasonable time.

Amended is the Department's rule-making authority so that program priorities and minimum numbers and scope of services and activities of community mental health board programs may be prescribed by rule. Standards for professional personnel will be established by the State Department of Mental Health.

Repeal of the Criminal Sexual Psychopathic Act

Public Act 143 (House Bill 3387) repeals the 1939 law generally referred to as the "Goodrich Act." The legal category of criminal sexual psychopath is abolished. The remaining tools in our law for dealing with sexual offenders are as follows: the offender, if convicted of a crime, may be sentenced to prison; a provision of the Criminal Code adopted in 1952 provides that a sexual offender, if determined to be "sexually delinquent" as defined, may be sentenced to prison on a day-to-life basis or an indeterminate sentence, a statute which has been little used in the past; and under the Civil Commitment Act, a sex offender may be committed by the probate court if there is no criminal charge pending.

Clarification of Hospital Act

Public Act 125 (House Bill 3808) amends Section 9 of the Hospital Act for Mentally Diseased Persons to make clear that a peace officer, with the approval of the prosecuting attorney, may confine a mentally sick person in a hospital, home or other place of detention, not just a jail. Certification by two legally qualified physicians is required with temporary detention not exceeding five days unless the probate court shall be a special order enlarging the time. Persons manifesting homicidal or other dangerous tendencies can be confined in a jail or other lock-up facilities.

Also amended was Section 10 of the Hospital Act relating to qualifications of certifying physicians by eliminating the requirement that such physicians "must be permanent residents of the State."

Clarify Use of Sheltered Workshop Fees

Public Act 89 (House Bill 3643) allows a department hospital to retain fees collected in sheltered workshops operated by the hospital, and to use such funds to purchase supplies and equipment and to pay patients.

Licensing and Supervision of Clinical Laboratories

Public Act 235 (House Bill 2378) defines a clinical laboratory as a "facility which may be patronized by any physician, health officer or other person authorized by law for the purpose of ob-

(Editor's Note: The September issue of **Michigan Medicine** described Senate bills which passed the 1968 Legislature and were given immediate effect. The following article briefly discusses House-introduced new laws which became effective upon being signed by the Governor. Subsequent articles will cover laws that become effective 90 days after adjournment of the Legislature on August 16, 1968. Copies of these laws are available by writing MSMS, 120 W. Saginaw, East Lansing 48823.)

taining information for the diagnosis, prevention or treatment of disease or the assessment of medical condition by examination of materials derived from the human body." This Act does not apply to laboratories operated by a person licensed or registered to practice medicine, who performs laboratory tests or procedures, personally or through his employees, solely as an adjunct to the treatment of his patients; of any college, university or school approved by the Department of Education which is conducted for the training of its students, if the results of any examination performed are not used in the diagnosis and treatment of disease; or those operated by the Federal Government.

The Director shall appoint a State Laboratory Facilities Council to assist with development of rules composed of three pathologists, one physician who is not a pathologist and is not directly associated with a clinical laboratory, two laboratory directors who are not physicians, one clinical chemist and one micro-biologist. The Director, with concurence of the council, shall promulgate, amend and rescind rules with reference to clinical laboratories.

Treatment and Rehabilitation of Alcoholics

Public Act 22 (House Bill 2961) defines alcoholism as a "chronic and progressive illness, characterized by an excessive and uncontrolled drinking of alcoholic beverages, and as a public health problem affecting the general welfare and economy of the state." The Act authorizes educational preventive programs for the treatment and rehabilitation of alcoholics; defines the duties of the Department of Public Health and establishes and defines powers and duties of a state advisory board of alcoholism.

The Act acknowledges the administrative transfer of the formally separate Board of Alcoholism through the principle Department of Public Health, as well as expanding the Advisory Council consisting of three licensed physicians one of whom shall be a qualified psychiatrist. The other four members represent the general public.

Sale and Possession of Certain Drugs

Public Act 126 (House Bill 3270) prescribes penalties for selling, offering for sale, bartering or otherwise disposing of or in possession of certain drugs, such as LSD, peyote, mescaline and its salts, DMT, silocyn, or psilocybin or any salt or derivative of the aforementioned or any drug possessing similar hallucinogenic properties.

Boards of County Institutions

Public Act 149 (House Bill 3467) permits counties with a population of less than 1,000,000 having an approved county tuberculosis hospital, the Board of Supervisors may create and appoint a board of county institutions for the purpose of maintaining and operating a county tuberculosis hospital, a county medical care facility and a county psychiatric facility; or may operate and administer all three as a single medical institution. Provisions also include authority to employ an executive head and other personnel and grants authority to the board for establishing policies covering operations of the hospital or institution, including the conditions of admission and the rates to be charged.

Regulates Narcotic Drugs

Public Act 86 (House Bill 3601) regulates and safeguards legitimate use of and traffic of narcotic drugs and exempt narcotic drugs; suppresses the illegitimate use, possession, control, sale, manufacture, production, disposition, administering, compounding, dispensing, prescribing and traffic by providing penalties for violations.

Public Act 103 (House Bill 3602) states: No prescription for any habit forming drug issued before or after the effective date of this Act may be filled or refilled more than six months after the date on which the prescription was issued and no such prescription which was authorized to be refilled may be refilled more than five times, except that any prescription for such a drug after six months after the date of issue or after being refilled five times may be renewed by the practitioner issuing it either in writing or orally if promptly reduced to writing and filed by the pharmacist filling it.

Appointment or Election of Medical Personnel to State Positions

Public Act 255 (House Bill 3776) provides that either a licensed medical physician or a licensed osteopathic physician is entitled to equal consideration, except on licensing boards, to appointment to governmental positions or service on state, county, city, township or other public agencies, departments or subsidiaries, wherever the laws of the state require such service.

Physician Must Help Detect Diabetes

BY HENRY D. KAINE, M.D., CHAIRMAN
DIABETES DETECTION COMMITTEE
MICHIGAN DIABETES ASSOCIATION

Diabetes Detection Week will be observed in Michigan and throughout the country November 17-23. The purpose of this intensified version of the year-round program to find the unknown diabetics and to test them, is to focus attention, with the help of the communications media, on diabetes and the need for early detection of diabetes.

In Michigan we are undertaking a program of free post-prandial blood sugar tests during Detection Week. Michigan hospitals have been asked to participate in this program. We are also asking the cooperation of the physicians of Michigan in this program. Helping to detect diabetes is one way of giving better medical care to more people. On the average, out of 122 patients who come into a physician's office, one will be an unknown diabetic. The earlier his diabetes is diagnosed and treated, the more successfully it will be controlled. MSMS members seeking additional information may write me at Michigan Diabetes Association, 6131 West Outer Drive, Detroit, 48235.

The importance of Detection Week was expressed by an editorial in the Journal of the American Medical Association for November 8, 1965: ". . . much work remains to be done. The drive stands in need of extension into areas where it has not yet penetrated. Toward that end Diabetes Week . . . needs the active participation of many more physicians. It would be a real service to patients, to the profession, and to the public if this year during Diabetes Week every physician in private practice would test for diabetes each of the patients he sees."

The Diabetes Detection Committee of the Michigan Diabetes Association urges physicians to do post-prandial blood sugar tests on their patients during Detection Week as a public service.

The Diabetes Detection Drive can succeed only with the cooperation of the practicing physician. He represents the first and main line of detection, as he is ultimately responsible for treatment. His help is essential if unknown diabetics are to be brought under medical care and thus remain effective members of the community.

Views Invited Re Drug Reports

BY JOHN W. MOSES, M.D.
SCIENTIFIC EDITOR

A Drug Information Center has been established at the University of Michigan under a grant from the Michigan Association for Regional Medical Programs, Inc. to act as a rapid, random access service function to the medical professions of the state of Michigan. Its goal is to help bridge the gap between the medical professions and the estimated 200,000 articles of medical interest published per year as a meaningful and useful service.

The center is open 24 hours a day and may be reached by dialing 313 763-0243 or by writing the Drug Information Center, University Hospital E 3103, 1405 E. Ann Street, Ann Arbor, Michigan 48104.

The Drug Information Center received 30 requests in January and has progressed to 129 requests in July with a high of 146 requests in June.

Types of questions asked in July were: 1) Dosage - 26, 2) Therapeutic use - 13, 3) Side effects and/or contraindications - 1, 4) Availability - 26, 5) Adverse reactions - 4, 6) Therapeutic compatibility - 2, 7) Pharmaceutical compatibility - 10, 8) Identification - 27, 9) Toxicity - 3, 10) Metabolism - 1, and 11) other (stability, solubility, cost, etc.) - 16.

From these requests a good picture of some of the drug problems facing physicians should be available.

Your editors would like to establish a regular feature based on the information sought from the Drug Information Center. Such format might include lists of drugs and questions, "Drug Information Question of the Month" with in-depth discussion and answers or combinations.

Your editors would like to hear from readers as to their desires.

Be A Doer

Theodore Roosevelt, 26th president of the U.S. (1901-1909), emphasized the need for persons to try to improve politics rather than merely find fault:

"It is not the man who sits by his fireplace reading his evening paper and saying how bad our politics and politicians are who will ever do anything to save us; it is the man who goes out into the rough, hurly-burly of the caucus, the primary, the political meeting, and there faces his fellows on equal terms.

"The real service is not rendered by the critic who stands aloof from the contest, but by the man who enters it and bears his part as a man should."

What Are The Reasons?

FROM THE NEBRASKA
MEDICAL SOCIETY JOURNAL

Some 14,000 students became finalists in the National Merit Scholarship program, and 10,770 of them chose their careers.

Seven percent of them, or 767, want to be doctors.

Only 767 out of 14 thousand?

Last year, eight percent, or 950, chose medicine.

The decline may seem like only one percent, *but it isn't.* When you go from *eight* of anything to *seven,* you've dropped one part in eight, and that's twelve and a half percent.

From 950 to 767 is a big drop. To bring home this point more forcibly, a fall from 950 to 767 is a decrease of 19.2%. To make it even stronger, the year-ago number was 23.9% larger than this year's.

We seem to be declining in quantity and, if we may say so, in quality.

It is easy, much too easy, to conclude that things are just fine, that the top students are still entering medicine.

But they're not. Just look at the figures.

Last year's total was higher than the one for 1965-1966. And guess what happened in 1966. Oil companies discharged geologists after the Suez crisis, and geology enrollment fell sharply. And if after 1966, fewer top students want to be doctors, our politicians should be told, and they should be told why.

More schools may give us more students, and we are not at all sure of this, but they won't give us better ones. The better ones aren't interested, not like they used to be.

We can only hope that the government will look at these figures and think, and call a halt to the socializing of medicine, and make the practime of medicine inviting.

The way it used to be.

Let's Take The Lead

FROM NEVADA STATE
MEDICAL SOCIETY JOURNAL

In no area of human activity is the folly of trying to reach a desirable goal by merely writing laws and spending tax funds more apparent than in the field of health care. Acting Health, Education and Welfare Secretary Wilbur Cohen, an outspoken welfare advocate, recognized this when he questioned the feasibility of expanding Medicare at this time. Although a staunch supporter of more government in medicine, he said such action would be "to precipitate." He told news reporters that shortage of hospital beds and physicians are problems that need solving first.

The medical profession is taking the lead in helping to solve these problems. Through its spokesman, the American Medical Association, the profession has called for all medical schools to "accept as a goal the expansion of their collective enrollments to a level that permits all qualified applicants to be admitted." It also supports federal participation in medical school construction to encourage applicants to be admitted. It also supports federal participation in medical school construction to encourage a greater production of physicians.

The president of the American Medical Association expressed the attitude of his colleagues when he commented, "Medicine has not failed the nation. Granting the existence of problems, we have today a firm base of widespread excellence upon which to construct the additional improvements which all of us recognize are needed."

The quickest way to destroy high medical standards would be to treat doctors as if they were public property, and to swamp their good works in an orgy of government medicine.

Going to Miami?

BY JOHN W. MOSES, M.D.
SCIENTIFIC EDITOR

The American Medical Association conducts two national meetings a year, the Annual convention and the Clinical convention. The 22nd Clinical Convention will be held in Miami, Florida, December 1-4, 1968. The Clinical Convention is beamed to the busy practitioner and attempts to inform the physician of the latest advances in medical knowledge and technology.

During this year's Clinical Convention there will be 125 exhibits reflecting the latest developments in pharmaceuticals, medical equipment, and scientific endeavors. There will also be special postgraduate courses in diabetes, fluid and electrolyte balance and thyroid disease. About thirty medical motion pictures and live color scientific television programs will be offered. Clinical workshops and four breakfast roundtables will complete the program.

In these days when scientific progress is advancing so rapidly, the 22nd Clinical Convention offers a rapid and enjoyable way of keeping abreast of the latest developments.

Give your wife a day in the sun while you increase your knowledge.

See you in Miami.

MASON, HUFF CHOSEN AS CO-CHAIRMEN

Michigan Leaders Endorse MSMS Proposed Citizens Committee on Medical Manpower

A Michigan Citizens Committee on Medical Manpower was called for October 16 to spearhead a statewide effort "to produce more doctors of medicine and other medical personnel in Michigan to help relieve critical shortages in many Michigan communities."

The need for a Citizens Committee was discussed by a group of distinguished medical, educational, business, and labor leaders called into session in Detroit by MSMS.

After a unanimous agreement to organize a citizens-committee movement, the group elected Robert J. Mason, M.D., MSMS President Elect, and Warren M. Huff, of Plymouth, long-time prominent leader in Michigan educational and civic affairs, as co-chairmen.

* * *

THE CITIZENS COMMITTEE when formed will include prominent leaders in the field of business, industry, government, labor, agriculture, education, and community service. Regional committees are to be organized on a similar pattern.

The ad hoc citizens group agreed today to accept the evaluation of MSMS House of Delegates that "the quickest, most economical and most effective way to produce more physicians in Michigan is to immediately expand the present two-year medical school at Michigan State University into a four-year, degree-granting medical college."

The MSMS House of Delegates, at its recent annual meeting, instructed that "citizen groups should be established which would take it upon themselves to join the physicians in urging the necessary legislative financial support to meet the demands for more physicians."

* * *

THE HOUSE OF DELEGATES declared that "through the development of the clinical areas of the Michigan State University College of Human Medicine, the State of Michigan can most immediately, effectively and economically qualify the present MSU program as a fully-accredited medical school, and thus with speed and efficiency increase the supply of well-trained physicians so greatly needed to meet the health needs of our rapidly growing population."

Many statistics point up the need to train more physicians in Michigan, declares Robert J. Mason, M.D., Birmingham, MSMS President-Elect, who chairmaned the conference. He said the medical schools at the University of Michigan and Wayne State University graduated 307 physicians this June, leaving Michigan far below the output of many other states. This condition will still hold true if Wayne State and the University of Michigan medical schools expand to their maximums planned — as was also advocated.

MSMS President-Elect Robert J. Mason, M.D., presided at the organizational meeting of the Michigan Citizens Committee on Medical Manpower.

* * *

MEANWHILE THE demand for physicians continues to rise each year in Michigan and the nation, Doctor Mason said. There is a current shortage of an estimated 52,000 physicians in the nation today.

MSU admitted its first class of 26 freshman medical students in 1966 and then added 26 more in 1967 and 26 more this year. The Michigan State Board of Education approved the detailed plans submitted by MSU in 1967 for a degree-granting program.

* * *

THE SECOND EVENT in the new medical manpower appeal was the Conference on Michigan Medical Manpower at the MEA conference center October 23 for physicians, school counselors, college officials, hospital administrators, government representatives, health agency executives, and others concerned with education and medical care. Doctor Mason was the banquet speaker, again stressing the need for a broad citizens effort to help convince the governor and the legislature to move forward the MSU proposal and to plan for the future.

Robert E. Rice, M.D., Greenville, was chairman for the conference.

More details will appear in the November *Michigan Medicine News Extra.*

Five Receive MSMS Certificates

Five Michigan physicians were voted the coveted "Certificates of Commendation" by the 1968 House of Delegates.

In making the report for the House Committee on Certificates of Commendation, Chairman Marjorie Peebles Meyers, M.D., declared:

"The Committee is proud to present for the consideration of the 1968 House of Delegates the names of five distinguished Michigan doctors of medicine for Certificates of Commendation. They are alphabetically, A. Fleming Barbour, M.D., Genesee; Harry A. Clark, M.D., Mason; John M. Dorsey, M.D., Wayne; Fred C. Sabin, M.D., Marquette; and Wilbur D. Towsley, M.D., Midland. Each was nominated by his county medical society, and was considered by the Committee along with other county nominations."

The House concurred.

All were present to receive their awards at the Delegtaes Dinner except Doctor Towsley, whose health did not permit him to travel from Midland. Harry A. Towsley, M.D., a Washtenaw delegate, accepted for his brother. Harry received such a citation himself in 1966.

* * *

Doctor Barbour who has practiced in Flint for 28 years, received a citation which declared:

"In recognition of his inspiring civic service in Flint for more than 25 years, especially with community programs for children, churches, the needy; and also for his excellent leadership in medical and specialty organizations."

Fleming A. Barbour, M.D., right, Flint, who received a Certificate of Commendation, visits with Harry A. Towsley, M.D., left, Ann Arbor, who accepted the Certificate for his brother, Wilbur D. Towsley, M. D., of Midland, who was unable to attend the Delegates Dinner.

* * *

Doctor Clark, who taught medicine from 1919 to 1949 and since has practiced at Muskegon, Ludington and Scottville, received a citation which stated:

"In recognition of many years of inspirational teaching as a professor at the Wayne State Uni-

A Certificate of Commendation was received by John M. Dorsey, M.D., right, distinguished WSU professor, from Speaker James B. Blodgett, M.D., at the Delegates Dinner.

Harry L. Clark, M.D., right, Ludington, received a coveted Certificate of Commendation from Speaker James B. Blodgett, M.D., during the Delegates Dinner.

Continued: Five Certificates

versity Medical School; and in appreciation for continuing medical contributions to the people of Muskegon, and now Mason counties."

* * *

A member of the WSU medical faculty since 1946, Doctor Dorsey received a certificate which read:

"In recognition of his distinguished career as a psychiatrist, teacher and chairman of the Wayne State University Medical School Department of Psychiatry; and his many continuing contributions now to medicine, literature and education as the 'WSU University Professor.' "

* * *

Doctor Sabin, who has practiced at Marquette since 1957, accepted a citation which declared:

"In recognition of his dedicated service as a member of the Northern Michigan University Board of Control and as a member of the Michigan State Board of Registration in Medicine; and as a prominent citizen of Marquette in professional, political, and business circles."

* * *

The citation for Doctor Towsley, who has practiced in Midland for 45 years, read:

"In recognition of 45 years of distinguished service in Midland as a beloved family doctor; and for his unselfish assistance to many medical students, and also to many children and families in need."

Since the Certificates of Commendation were established in 1961, the House has approved four awards in 1962, four in 1963, six in 1964, three in 1965, seven in 1966, and six in 1967.

Fred C. Sabin, M.D., Marquette, received a Certificate of Commendation from Speaker James B. Blodgett, M.D., during the Delegates Dinner.

U-M Med School Tells Changes In Key Posts

Several changes have been made in the administrative staff of the University of Michigan Medical School this fall.

John A. Gronvall, M.D., has been named associate dean to succeed Alexander Barry, M.D., who joined the University of California School of Human Medicine at Davis. Doctor Gronvall had been associate dean and associate director of the University of Mississippi Medical Center.

Robert A. Green, M.D., who has served as assistant dean part time the past year, was appointed to the new position of associate dean for student affairs. The new office of associate dean for academic affairs has been filled by George R. DeMuth, M.D.

Doctor Gronvall currently is director of a national curriculum study sponsored by the Association of American Medical Colleges. He has been closely involved with the development of U.S. regional medical programs. In 1966, Doctor Gronvall was acting dean of the Mississippi School of Medicine and acting director of the Medical Center. A pathologist, he is a graduate of the University of Minnesota.

Doctor Green has been a U-M faculty member since 1958. In his new position he is responsible for liaison activities with schools, colleges, and hospitals; for the review of applications for admission; for counseling; for discipline; and for keeping tabs on the academic and professional development of each of the nearly 800 students on the nation's largest medical campus. Doctor Green has coordinated the special studies program of the Medical School and also is chief of the pulmonary disease section of Ann Arbor Veterans Hospital.

Dean William N. Hubbard, Jr., M.D., explains that the establishment of the office of associate dean for academic affairs reflects the urgent need to revise medical education to respond to new social needs. In that post Doctor DeMuth is responsible for revising the curriculum and promoting research in medical education.

Doctor DeMuth, a pediatrician specializing in pulmonary disorders, has been at U-M since 1956. He has been involved with faculty committees concerned with curriculum, examinations, research, and general educational policies the last five years. He is chairman of the faculty conference on curriculum, and a member of the clinical planning committee responsible for a major part of the new Medical School curriculum.

Ross V. Taylor, M.D., right, of Jackson, and Ralph R. Cooper, M.D., Detroit, are the new leaders for The MSMS Council for 1968-69, elected at the re-organizational meeting at the close of the 1968 Annual Session. Doctor Taylor was advanced from the vice-chairmanship to serve as chairman, and Doctor Cooper was chosen as the new vice-chairman. Doctor Taylor succeeds Robert J. Mason, M.D., who was named by the MSMS House of Delegates as the new President-Elect.

Elect 10 MDs To Shield Board

Ten physicians were among those elected at the 1968 Michigan Blue Shield Corporation meeting to the Shield Board of Directors.

The physicians elected to the board were Brock E. Brush, M.D., Detroit; Eugene L. Freitas, M.D., Detroit; Harold Gehring, M.D., Royal Oak; Homer A. Howes, M.D., Detroit; Philip J. Huber, M.D., Detroit; William B. Jensen, M.D., Grand Rapids; Paul T. Lahti, M.D., Royal Oak; Julien Priver, M.D., Detroit; George L. Reno, M.D., Detroit; Richard E. Wunsch, M.D., Traverse City.

Also elected were Kenneth Boekeloo, Detroit; Laurence A. Hill, Ann Arbor; Frank J. McDevitt, D.O., Livonia; Kenneth Wolz, Saginaw; Victor M. Zink, Detroit.

Elizabeth Crosby, M.D., right, who numbers her medical students in the thousands, was honored by the University of Michigan Medical Center Alumni Society this month for outstanding service. John Goodsell, M.D., Saginaw, president of the Alumni Society, presented the certificate to Doctor Crosby. Also saluted was Mrs. Dolores White, center, long-time assistant head nurse at University Hospital.

Vernon V. Bass, M.D., left, Saginaw, Chairman of MDPAC, visits with the two congressmen-speakers after the annual MDPAC Breakfast. Congressman Donald Riegle serves the 7th Congressional District of Genesee and Lapeer counties, and Congressman John Conyers, Jr., serves the 1st Congressional District, covering a portion of Detroit and all of Highland Park.

Kellogg Fund Finances More Studies By State Board about Health Care

A grant of nearly $100,000 was made recently to the Michigan State Board of Education by the W. K. Kellogg Foundation of Battle Creek to help finance studies of educational programs in medical and allied health fields.

The money, which totals $98,680, will be used to continue the work of the State Board Advisory Committee on Education for Health Care.

State Board of Education President Edwin L. Novak of Flint said the grant will be used to subsidize salaries of the committee's staff for two years, providing for a project director and assistant, two researchers and staff travel as well as office equipment and supplies.

"We are indeed pleased that the Foundation in recognizing the important work of this committee has given so generously to support its efforts," Novak said.

THE 17-MEMBER COMMITTEE was organized in April, 1966, and charged with studying educational implications of health manpower needs in Michigan and making recommendations to the Board concerning educational preparation of such manpower.

It hopes to accomplish its goals in a three-phase program:

1. An inventory of health care manpower in Michigan, including an inventory of the educational programs for the preparation of such manpower;
2. Development of a plan to provide educational facilities and programs necessary to meet the needs for health care personnel in Michigan;
3. Further studies and research which relate to findings and recommendations of Phase I and II.

Three advisory groups report directly to the Citizens Committee. The first, called the General Advisory Committee, is charged with taking a "functional approach" to health manpower needs, and is staffed on the basis of individual qualifications of members, rather than professional or institutional affiliations.

THE OTHER TWO subcommittees report directly to the General Advisory Committee. The Advisory Committee on Medical Education is composed of medical doctors and osteopaths, and the Advisory Committee on Nursing Education is represented by professionals in the field of nursing. Both subcommittees provide technical assistance and data from their respective areas and recommend programs to fill manpower shortages.

These recommendations are then included with other reports compiled in related health fields and submitted to the Citizens Committee. Before being submitted to the State Board of Education, the reports are reviewed by the Citizens Committee and evaluated in terms of cost, compatability, political implications, etc.

The flow may also be reversed. When an institution of higher education requests sanction from the State Board for establishing academic programs in health-related vocations, the Board often asks for study and recommendations by the Citizens Committee before taking action.

A COMMITTEE STUDY of schools of medicine in the state led to the recommendation of a four-year School of Medicine at Michigan State University. The committee has also made significant recommendations on the needs of osteopathic medicine in the state and has set up a system of priorities for new medical schools. It is currently studying a proposal to establish a College of Osteopathy in Michigan.

The Committee conducted a survey of applicants and admissions to associate degree nursing programs and has worked closely with many health-oriented agencies and organizations, such as the Michigan Association for Regional Medical Programs, the Comprehensive Health Planning Commission, the Manpower Task Force of the Vocational Rehabilitation Comprehensive State Planning Project, the Human Services Occupations in the Department of Mental Health, and others.

It is currently compiling the final report of Phase I, which surveyed the supply and distribution of manpower in a wide variety of health professions and occupations as well as the education programs for the preparation of such health personnel. Preliminary findings and recommendations are divided into two areas: (1) general recommendations relating to the need for trained manpower in a wide gamut of health careers, the need for continuing planning and coordination to meet these needs, means for implementing such planning, and the role of the institutions of higher education in meeting the needs for trained manpower in health fields; and (2) specific recommendations relating to particular occupational areas, e.g. medicine, dentistry, nursing, medical laboratory services, etc.

ALTHOUGH ADDITIONAL recommendations and slight alterations may occur in the final draft, the preliminary report includes the following conclusions:

1. Primary responsibility for the development and administration of educational programs in the health care area should be carried by educational institutions.
2. Where clinical experience is an integral part of education for a health profession or occupation, such experience should be under the control of the responsible educational institution. The health facility providing such clinical experience should be reimbursed for such educational costs as instructors' salaries, stipends, teaching materials, etc.
3. Preparation of qualified faculty must take high priority in the development of educational programs in the health area. Shortages of competent faculty in many teaching areas emphasize the need for careful planning for expansion of existing programs and establishment of new programs to ensure the most effective use of faculty resources.
4. The impact of new knowledge and technology in the health care field will require innovations in curricula of programs preparing health personnel. It is particularly important in setting up new educational programs that sufficient flexibility be built in to take account of anticipated changes in the role of the particular health profession or occupation.
5. The university medical centers should assume a leadership role in the development of educational programs in the health area in the dissemination of research findings and in the continuing education of health personnel. These efforts should be coordinated through the Michigan Association for Regional Medical Programs.
6. Universities with medical centers or with considerable strength in the biological and physical sciences should consider developing interdisciplinary programs in the preparation of allied health personnel. Such Schools of Allied Health Professions have already been established in a number of states.
7. Reciprocity between community college districts is needed to implement regional planning for education of allied health personnel.

IN ADDITION TO working on a state plan for adequate health care education facilities, the Committee in the next two years will help develop demonstration projects in allied health education such as medical technology and para-professional fields.

Other areas of Committee concern may be establishment of a statewide health manpower data bank, the licensure and registration of health professionals, the development of a core curriculum in health sciences for community colleges and new curricula for evolving health technologies.

The Committee also will consider recruitment programs to interest young people in the health professions and to reactivate existing trained personnel who have left health careers.

AMA Invites You . .

MSMS members, when they are in Chicago, are cordially invited to visit the AMA Headquarters at 535 N. Dearborn.

Last year, nearly 900 persons toured the AMA building. The AMA extends a warm welcome to all physicians, their wives and guests to take a 40-minute tour to become better acquainted with the AMA's organizational structure, its major areas of activity and some of the numerous services available to physicians, as well as the public. Tours are given between 9:00 a.m. and 4:00 p.m., Monday through Friday.

Doctor, Your Shield Is Showing

BY LELAND E. HOLLY, II, M.D.
MUSKEGON

It appears appropriate that the record and future of Michigan Blue Shield should be reviewed. Certain of the specific observations and associated criticisms that have in the past been very pertinent can now stand only as matters of record. As such, however, they may be important at the next point in time when a review is again seen to be desirable. That time will come.

Blue Shield: The Doctors' Plan?

All advertisements say it is. The Michigan State Medical Society started Blue Shield in 1931. Further, the doctors of Michigan even reduced fees in the 1940's to "save" the plan from bankruptcy.

Blue Shield inception and growth has always been directed by the Blue Shield Board of Directors. Physicians have always been in the majority on this board. While this representation does not in any way indicate that Blue Shield direction was or is given by a concurrence of the majority of the physician directors, it has cemented the idea of a "doctors' plan" in the thoughts of the public.

The M-75 plan, with fee level tied to income classification, was touted as representing the physician's classic approach to charging fees, and was given near unanimous support by the Michigan State Medical Society.

In 1966 the Michigan State Medical Society changed tacks, and in resolution No. 29 the House of Delegates provided for establishment of the concept of reasonable, customary and prevailing fees. Again, we have a "doctors' plan."

If there is still doubt in your mind, answer the question, "Who will be blamed if Blue Shield fails?"

Blue Shield Views Itself

In 1931 Blue Shield was born in Battle Creek in a time of great economic deprivation. It was a time of great public and professional need and Blue Shield played the role of guardian savior to lay and professional alike.

President McCabe recently described the purposes at that time, ". . . Blue Shield would not be a commercial enterprise, an 'economic undertaking,' but would be a means of service alone, with free choice of physician, with limitation of benefits to service, with exclusion of profit."[1] President McCabe went on to say that the first plan offered would provide, ". . . in effect, comprehensive full prepaid medical care in home, in the physician's office, in hospital."[1]

In 1968, at a time when public and professional needs may be of greatly different character than in 1931, President McCabe said of the early ideals, "The goal was right. The know-how was not."[1] "It seems to me," said Mr. McCabe, "that this can be crystallized very simply to provide a mechanism substantially which sustains and maintains the desirable elements of the private practice of medicine in such a way as to make available quality care at the lowest possible cost."[1] Mr. McCabe also states, "Blue Shield must be the answer."[1]

Blue Shield as a "Savior"

There is good reason that Blue Shield would have doctors continue to believe in its role as the guardian and savior of medicine and the public. Physicians should remember, however, that a bankrupt Blue Shield and the public were "saved" by medicine in the fee-cutting days of the 1940's, and that a dying Blue Shield is again being rescued by physicians' approval of the Michigan Variable Fee. To accept both the thought of being "saved" and "saving," physicians are led logically and inescapably to the conclusion that they have been and are saving themselves and the public with their plan.

James E. Appel, M.D., of the AMA can be quoted, third hand, as follows: "The voluntary establishment of reasonable income ceilings is the only protection the profession has against governmental price controls."[1] While financial woes were the danger in the past, the new threat is government control. Physicians again find themselves preparing to "save" themselves and the public.

In this confusion doctors lose sight of the fact that Blue Shield is for all effective purposes a totally separate entity and could be totally independent of organized medicine. Consider, for example, its third-party role in Medicare.

Blue Shield and Quality Care

The main thread of the Blue Shield idea is to make quality care available at the lowest possible cost. It must be presumed that Blue Shield refers to high quality care. Consideration of the cost aspect can be postponed for the moment.

Unclear is how Blue Shield is to insure the height of the quality. Our state medical society has the means to control the quality of medical care and, in fact, does exercise the controls without regard to Blue Shield or any other insurance, governmental or lay program. The guarantee of high quality medical care is our moral and ethical obligation, and our right alone. It is not a right we have delegated to any lay party. Or have we?

Direct and indirect controls must be exercised in order to guarantee the patient his service and the doctor his fee. To the public "participators" are "good guys" and "non-participators" are "bad guys," and, somehow, the stamp of "quality care" is attached to the services of the former. Blue Shield emerges as the "protector" of the innocent sheep among the wolves.

Blue Shield and the Elimination of Profit

That the Blue Shield insurance business should make medical care available at the lowest possible cost and not make a "profit" has been clear from its beginning, but Mr. McCabe says "Doctors must pass on to the patients some of the savings resulting from increased productivity, especially as the amount of free service diminishes."[1]

Just what percentage of billings turns out to be "free service" in the physicians' experience? Does this percentage of "free service" apply to all doctors or to just a few? How much of the "free service" is reduced by the Blue Shield program? Is the number of "free patients" cared for by most doctors sufficient to make any difference in physicians' charges to other patients? Regardless, since 1957 it appears Blue Shield has extended the concept of no "profit" to physicians' fees.

Every physician must determine this for himself since what may be true for one physician or in one area may not be universally true. The fact remains, however, that the Blue Shield program between 1957 and 1968 went beyond the concept of a non-profit business venture when it passed on "savings" to patients by restricting professional fees to a level which it, in effect, had determined.

Blue Shield and Two Fee Schedules

Through the years under the cover of M-75, "the doctors' plan," this unreasonable Blue Shield fee restricting activity has made a double fee schedule necessary for many "participating" physicians. It has meant non-participation for many more. These physicians came to feel that the favorable premium rate Blue Shield subscribers enjoyed, supposedly generated from an effective, efficient, non-profit insurance system, was simply a reflection of the inadequate fees allowed. Some physicians have suggested that the unique and onerous clerical requirements of the Blue Shield program should actually justify a surcharge.

On the other hand, the existence of such a double fee schedule for "participating" physicians and non-participation by many others has been construed by some patients and public to mean that the honest fees of these physicians are prima facie evidence that they have "profited" off private-pay patients and unfavored insurance companies. This certainly is a logical deduction when it has long been and continues to be Blue Shield's assumed duty to determine a physician's "valid"[1] fee and its "normal evolution."[1] After all, it is the doctors' plan, isn't it?

It has been said that the existence of inequitable fees is not Blue Shield's doing, and that other factors and people have been involved since 1957. Is it just the insurance commissioner, or were other identifiable influences also at work? If the cost of living rose 20 per cent by 1971 could physicians' fees be changed accordingly?

The desirable elements of the private practice of medicine seem to include the preservation of the right of the physician to set his own high

LELAND HOLLY, II, M.D.

The author is in practice as a radiologist; 889 Second Street, Muskegon 49400.

standards of care and also his own fair fee. If physicians have given up any part or all of these rights, directly or indirectly, they should know clearly why, the extent, and to whom. Given up they are, but the terms are unclear to most physicians.

Blue Shield Keeps Fees Down

To the extent that the extra clerical work Blue Shield requires is done in every doctor's office and hospital at no expense to Blue Shield and to the extent Blue Shield benefits are less than a physician's honest compensation, medical costs are held down.

Mr. McCabe has seemingly ignored other factors when he said, "Consider non-participation from an impersonal point of view. I have no doubt that should non-participation be large there will be inevitable and rapid escalation of fees, for such is the nature of economic pressures, no matter how high may be our resolves."[1]

Certainly, Blue Shield should recognize that economic pressures are a valid reason for raising fees. Blue Shield certainly should also recognize that 95 per cent of the physicians are conscientious, honest, reasonable, cooperative, and, believe-it-or-not, sensitive to patients' and Blue Shield's problems with bills. Or isn't physicians' economic welfare important? Or aren't 95 per cent of physicians honest?

That there would be a "rapid escalation of fees" is an assumption on the part of Mr. McCabe which may or may not be true. Historically, it certainly has not been and some examples quoted from an actual fee schedule of several years ago, compared to those more current will lend credence to an opposite viewpoint.

1934 - Ordinary day visit (7 a.m.-10 p.m.) [away from office]	$3.00-$5.00[2]
1959 - 003 Home, First Visit	$7.50[3]
005 Hospital, First Visit	$10.00
Subsequent Visits	$4.00
1967 - 9001 & 9009 Routine limited visit at home	$12.50[4]
1967 - 9601 Initial Hospital Visit	$15.00[4]
Each day for 20 days thereafter	$5.00
1934 - Appendectomy	$125.00-$250.00[2]
1959 - 3261 Appendectomy	$105.00[3]
1967 - 3261 Appendectomy	$175.00[4]
1934 - Chest - Heart	$10.00[2]
1959 - 7100 Chest, PA	$10.00[3]
1967 - 7100 Chest, PA	$10.00[4]
1934 - Pyelogram, Intravenous	$15.00-$20.00[2]
1959 - 7372 - Pyelography, Intravenous	$30.00[3]
1967 - 7372 - Urography, Excretory	$35.00[4]
1934 - Wrist x-ray	$5.00[2]
1959 - 7256 - Wrist	$10.00[3]
1967 - 7257 - Wrist	$10.00[4]
1934 - Cystoscopy, Hospital	$25.00-$50.00[2]
1959 - 3931 - Cystoscopy, Diagnostic, initial	$15.00[3]
1967 - 3931 - Cystoscopy, Diagnostic, initial, hospital	$50.00[4]

These examples, admittedly not comprehensive, indicate a very strong tendency on the part of physicians to hold fees down and to pass on the rewards of increased productivity to the patient. Where increases seem large is where overhead expenses such as wages, equipment and rental rates are greatest (up to 70 per cent), or where the service is not comparable.

Is credit for this remarkable record to be assumed by Blue Shield?

Blue Shield Recognizing Its Ills

Of M-75, a program that was hoped would cure Blue Shield's problems, Mr. McCabe has said, ". . . as you and your patients become increasingly irked by these fixed-fee levels and patient income classifications, by such things as slow recognition of specialities, by all the signs of what you might call obsolescense of what you and Michigan Blue Shield had devised, medicine and Shield went back to that original search for common effort for common cause."[1]

A great majority of Michigan State Medical Society physicians were willing to admit many years ago that M-75 had been a mistake, but the clamor that arose for correction got no response for those many years. It does not appear, therefore, that 11 years of progressive deterioration came about because the doctors wanted it that way. It appears that the major culprit may be hopefully seeking someone to share the burden of guilt.

It is probably fair to say that Blue Shield inertia has been caused in part by the Michigan State Medical Society's failure to direct and insist upon coherent, in-depth studies of, and solutions for, current and future socio-economic and health needs. Nor has the Michigan State Medical Society demanded clear correlation between Blue Shield's words and deeds. As an example, it is only necessary for physicians to consider the following statement of Mr. McCabe, "As I have said, we do not intend to force doctors to spend their time shuffling paper. Your business is rendering medical care."[1] Or a physician can consider another quote from Mr. McCabe, "May I quickly add that I believe that your experience with Blue Shield in present review procedures, both in connection with this and in the matter of determination of reasonableness of fee, mentionad a few minutes ago, has shown you that we at Michigan Blue Shield **have** and intend **to continue to cooperate** fully with the profession in such matters."[1] Some physicians would be rather definite in stating that for 11 years considerable paper shuffling has continued unabated, perhaps even enhanced, along with growing uncooperation and unresponsiveness on the part of Blue Shield.

Apparent acceptance over the years of the Blue Shield program in southeastern Michigan, without suggesting that this acceptance is not based on the informed desire of area physicians, has played a tremendous role in justifying the continuation of Blue Shield and the apparent inertia of its dynamic growth and maturation over the last ten years.

A Recommendation to Blue Shield

From a truly doctors' insurance program, as Blue Shield professes to be, physicians should not expect:

1. Immediate changes in policy after such have been recommended by physicians.
2. A program which ignores individual physician dishonesty or fails to have a means to guard against it.
3. A program to pay "way out" charges without realistic examination.
4. A program which will respond to vituperative, stubborn, disinterested, selfish, nonconstructive non-cooperation.

But doctors should expect to enjoy:

1. As great a simplification of billing as modern technology can provide.
2. Development of an effective, efficient system for redress for all parties in the insurance program.
3. An effective system for constant program modification as economy and medical advance dictate.
4. A current fair and reasonable variable fee adjusted each year or at similar reasonable intervals.
5. Prompt, essentially unquestioning payment for services.
6. A favorable image presented for all physicians, regardless of whether they are "participating" or not.
7. Fair, friendly, and tactful dealing with physicians without threats of harassment.

In return physicians should provide:

1. Proper identification of the service.
2. A record for the reason for the service.
3. A reasonable charge for the service determined by good practice under the circumstances.
4. Complete identification of the recipient of the service.
5. Availability of record for confidential and actuarial use of the carrier and for surveys to determine veracity of providers and consumers.

Blue Shield Curing Its Ills

Blue Shield has come up with its new Michigan Variable Fee program (MVF). This new program is said to guarantee a physician his usual and customary charge providing it is reasonable. Mr. McCabe asks, "Realistically, who can object? There are adequate provisions for payment outside range for unusual circumstances and procedures."[1] Such a promise for the variable fee program seems to fly in the face of past experience.

Mr. McCabe says, further, "As I see it, it is a simple question of working cooperatively and positively together in the development of the techniques needed to reach a common cause."[1] All physicians must agree with this but they must also note that if the doing is as simple as the asking, and if there had been a lot more of the former, the grand promise of reaching the "common cause" might have more substance.

As to the promise of the physician's reasonable and customary fee, the words are nice, but the promise may be empty when analyzed. "Profiles" or "prevailing fees" can have no meaning from Blue Shield experience to date since there has been no adequate, modern, complete standardized reporting of services in the absence of a common coding and nomenclature system.

Among other things the "prevailing range" of the new Michigan Variable Fee program is dependent upon community size and area in the state according to "exact differences in such fee determinants in the past."[1] In the absence of a uniform state-wide reporting system, presuming no other deficiencies in the statistical data of Blue Shield, the existence of such exact determinants is open to serious question.

A customary fee may be altered on 90-day notice. "Action will be immediate."[1] Even though the request be denied as being outside of the prevailing range, the factor of a request for alteration ". . . itself will tend to extend the prevailing range, in standard statistical method."[1] Historically, "immediate" is subject to wide interpretation by Blue Shield. And just how the standard statistical method operates in the Blue Shield situation is obscure.

Do physicians have clear knowledge of how they can alter their fees; can they have clear expectations that this alteration will be accepted? Can a raise in fees above the fair and reasonable fee for 1968, as determined by Blue Shield, both as to amount and timing, ever be accomplished without approval of big industry-labor, the insurance commissioner or others?

To date the new MVF program has been woefully inadequate in meeting effectively, much less efficiently, many of the requirements of any reasonable insurance program.

Who's in Control?

Given the Blue Shield program, doctor control is of paramount importance, but it is not attainable through the Blue Shield Board of Directors, nor with any certainty through the House of Delegates as the Blue Shield corporate body. In those two groups there is only doctor **influence.** Any absolute control is diluted by the many outside forces which are usually non-medical.

Unless doctors act as a nearly unanimous group of non-participating, non-assignment-taking providers, or act on nearly unanimous recommendation for dissolution by the House of Delegates of the Michigan State Medical Society as the Blue Shield Corporation, the Blue Shield insurance program will continue to function with doctors' control greatly diluted. There does not appear to be a middle road.

There is very real and justified confusion as to whom the Blue Shield creature belongs — big industry-labor or the Michigan State Medical Society. We know to whom everyone thinks it belongs, and at whose feet blame for difficulties will be laid. But Blue Shield fees and service benefits are tied to industry-labor negotiations with no guarantees of acceptable adjustments as they may be desired by the medical profession. There is only an unspecified promise, unbacked by past performance, of a dynamic insurance program which will keep pace with the times medically and economically. Can physicians believe this is possible if the real control lies with industry-labor or some other faceless group?

We are asked to accept this promise only because Blue Shield needs us. But what have they shown to warrant such trust? For ten years the Blue Shield program has been extremely unresponsive to the needs of the medical profession. It is not practical for physicians to accept another ten years of the same, or, for that matter, even three years.

Such inability of Blue Shield to respond particularly to unique or varying provider situations, unless the provider has been of the stature of large institutions not generally found in out-state Michigan, should be a matter of great concern. The signature of approval on the participation agreement of the individual "little man" physician working for his patients by himself is certainly very trusting. It is questionable if his consent to "participate" is informed.

The dilemma of the individual physician who wishes to practice non-participation is pointed up by the implication of Mr. McCabe's words when he states, "I am afraid it [per case participation] may successfully deter full participation and will be looked upon by those in our community who we must also satisfy — those who pay the bill — as an indication that the medical profession is unwilling to be cooperative, is unwilling to even subject itself to the administrative jurisdiction of an organization in which it plays a major role — in fact, the significant policy-making role."[1] It appears clearly implied that the independent physician may be considered some form of pariah if he does not cooperate.

Doctor Approval Is an Act of Faith

It appears quite definite that most Michigan physicians signed the agreement to participate in the Blue Shield Variable Fee program. If this were not the case, it cannot be conceived that large corporations would purchase this kind of insurance for their employees. It is also certain that the management group, as well as the employees, expect that the employee will not have to pay a cent for any medical service he receives once the no-member-liability rider is attached (as it is in many cases). Such a program could not have been honestly offered without significant and probably preponderant cooperation from Michigan physicians.

All physicians know who the provider is. All physicians think they know who the consumer is but it is quite apparent that they do not know him well. Physicians know only their patients who are merely one part of the consumer body. The other part may be industry-labor, big government, large pressure groups, or even small effective minority groups in industry, labor, society, or medicine. To these others Blue Shield may be a means to control physicians!

Physicians must be advised that acceptance of the new MVF is an act of faith. Unless the honest expectations of almost every physician in this state have been identified and met, and unless their emerging expectations are met as these expectations in time become the majority, the physician's faith will have been betrayed. He has given up his rights and duties for naught.

Unlike a machine which operates as directed, the Blue Shield program is a creature which may act independently. Such a creature requires far more strength and far greater surveillance than a machine for proper control. It is doubtful that organized medicine can ever act with the unity necessary to provide this strength and surveillance. The characteristic individuality of physicians may prevent adequate control ever being realized. Careful and close adherence to clearly defined and understood first principles are necessary but does not appear practical under the circumstances.

Doctor, your Shield is showing. What will you do about it?

WHERE WE'D BE WRITING COPY

From the East Jordan News-Herald

"We like the imagery of our enterprise, white knight of freedom, last bastion of individual rights, guardian of Democracy, and the rest of the cliches which at one time or another have been used in describing the role of the "fourth estate."

"And so it's with a bit of trepidation that we offer our commentary concerning at least one aspect of the status of the medical profession—or the "first estate."

"Today, many small communities are without the services of doctors—and this phenomena appears as a growing trend.

"By population statistics and other distributive comparisons, these communities are entitled to medical service—one and sometimes as high as a half dozen doctors.

"YET, THEY HAVE NONE.

"And, by contrast, other communities may be over-blessed with medical men. The per capita ratio gyrates wildly from city to city or even between adjacent communities.

"In each instance, there may be reasons for these differences in the amount of medical service available.

"This may be due to the presence of an outstanding hospital; an outstanding clinic; the location of the community or its particular assets; the cooperation of local merchants and civic leaders in creating an amiable medical climate.

"These are just a few of the reasons that one community of 4,000 people may have 6 or 8 doctors while another community of 4,000 has one doctor, or none.

"The medical profession itself has recognized this disparity in medical placement and has sought by its own enterprise to place doctors where they are needed—through voluntary placement agencies that try to help new doctors in locatiing.

"BUT SUCH AGENCIES can only do a certain amount. Frequently, legislation may be against them—such as it is here in Michigan where future practitioners must pass a lengthy basic science exam. This requirement contributes to the doctor shortage in Michigan by putting up a bar against doctors from other states who might want to settle here since such examinations require a long brush-up period for the doctor who has been out of school for five to ten years—when he is really at the peak of his efficiency.

"However, if the inequitable distribution of doctors continues to develop along its present patterns, it would seem inevitable to us that some day Big Brother will start dictating the assignment of physicians.

"This would be reprehensible.

"However, since the constitutionality of individual rights seems to be set in terms of political expediency in our modern world, it would be difficult to predict what might happen—if Big Brother starts meddling again with medicine (witness our clogged hospitals and spiraling medical costs since Medicare started).

"The justification for governmental placement of physicians might be established on the basis of a general philosophy that since the state supports medical schools with tax dollars, it should have a voice in regulating some of the affairs of those who have benefited.

"IF THAT SHOULD ever take place, total regimentation of the entire populace could then follow. The government, by the same reasoning, could start ordering teachers to where they might be needed, engineers to certain type of projects.

"In short—anyone who had ever accepted a cent of educational subsidy, directly or indirectly, would then become a pawn in the affairs of government.

"And we can't help but close this thought for the week with facetious observations that if such a sorry state of affairs ever transpires, even newspaper editors who had trained at a public university could also be ordered to a duty assignment. With a certain insight as to our own status in the eyes of Big Brother, there's a good possibility that we'd all be typing copy in Hell."

BLUE SHIELD PRESIDENT SAYS:

Private Sector Can Meet New Health Care Demands

BY MICHIGAN MEDICAL SERVICE

"The private sector has the capability to meet the demand for increased medical care within a sound economic structure without government intervention," John C. McCabe, president of Michigan Blue Shield, told Michigan physicians at the annual meeting of the corporation, Sept. 24 in Detroit.

The members met in conjunction with the annual convention of the House of Delegates of the Michigan State Medical Society.

"Medical care will cost more — because it will be worth more," Mr. McCabe said, "just as it is worth more today than yesterday."

"However, I believe that the incremental costs will not be abusive. I am convinced, as well, that we will be able to work together to see that this will be true."

The Blue Shield president said much current criticism of private medicine comes from those "who are less concerned with correcting what they call the faults of the Medical economy than they are with redesigning it to suit their own philosophical views."

Mr. McCabe declared:

"There are those who feel that the situation calls for less continuity and more change and that the problems are such that radical redesign is the only answer and that revision and readjustment will be ineffective.

"The contrary is true. Crucial to our success is a benefit program to which maximum physician cooperation has been committed. Only through a more nearly total physician participation can we assure the public and the large group customer — as well as the critical in and out of government — that our subscribers will be able to receive services with a minimum of difficulty, with an assured level of quality, and at a cost which is equitable for the physician and reasonable for the public."

Mr. McCabe said the growing demand for more pre-paid medical service in the private sector is reflected by increasing enrollment. By July of this year Blue Shield was serving more than 5,536,000 people in its program — 63.6 per cent of the State's population — and its subscription income, excluding government business, has reached the $150,000,000 a year level and will achieve a $175,000,000 rate next July.

Blue Shield will pass the 8,000,000 claims per year mark this year, Mr. McCabe said, and will pay 10,000,000 claims in 1969. In 1970 the figure will rise to nearly 20,000,000 he said.

Mr. McCabe reported that Blue Shield's Conversion to its MVF, or Michigan Variable Fee program has passed the million member mark and will have been extended to more than 3,500,000 persons, or 80 per cent of non-government Blue Shield membership, by the end of 1968.

The program is designed to meet virtually all medical care costs without regard to patient income.

Discussing other operational activities for the first half of 1968, Mr. McCabe said that Blue Shield employs 1,343 people, more than 33 per cent higher than in the summer of 1967, "and three and one-half times what employment was when I came to Blue Shield less than three years ago."

The growth has forced major systems revisions and development of new computer techniques, Mr. McCabe noted, and innovations such as new plastic coated membership cards now being manufactured for use in "charge plate" techniques to eliminate most paper work and speed service.

It has also resulted in need for the new joint Blue Shield-Blue Cross service center complex to the west of the Chrysler Freeway north of Jefferson.

NEW MEMBERS

Members of the Michigan State Medical Society join in welcoming the following new members into a progressive state medical organization. MSMS is dedicated to promote the science and art of medicine, the protection of the public health, and the betterment of the medical profession. Each new member is encouraged to join with other MSMS members at both the local and the state levels in achieving these goals.

Explain How Medicare Patients Will Pay 10% More in 1969

Examples of how the 10 per cent increase will effect Medicare beginning January 1. The 10 per cent increase in the amount that patients will pay for hospitalization under Medicare was announced in September by Wilbur J. Cohen, secretary of HEW.

Following are some examples:

A patient now pays the first $40 of his hospital bill, Medicare covering the balance thru the 60th day of hospitalization. Beginning Jan. 1, the patient will pay the first $44.

The patient pays $10 a day from his 61st to his 90th day of hospitalization. This increases to $11 a day, with Medicare handling the balance.

The patient pays $20 daily for the next 60 days. This will be raised to $22.

Should the patient enter a nursing home after hospitalization, his first 20 days of care are free of charge. After that he pays $5 a day from the 21st day to the 100th day, with Medicare taking care of the balance. The $5 rate increases to $5.50 a day.

Cohen attributed the rate rises to increasing hospitalization costs, which he blamed on "a multiplicity of reasons." He said a hospital stay of an elderly Medicare beneficiary averages about $600.

SAFETY TIPS

Wearing a seat belt would have saved 40 percent of those killed in highway accidents, University of Michigan safety research shows.

Driving with bald or worn tires at high speeds on wet concrete is like driving on ice, according to the University of Michigan Highway Safety Research Institute.

LAUDS NEWS EXTRA

Michigan Medicine's newsletter was recently given recognition by an American medical society executives association study.

The front page of a recent issue was reproduced in the organization's newsletter with the comment:

"Michigan's eight-page brown ink on blue paper is a quality production using bleed-offs and an interesting variety of articles. Along with the careful placing of articles by their importance, the issue is used to stress a particular coming event."

Work is proceeding on the new $24 million Basic Science Building of the Wayne State University Medical School. The building, which will be only slightly smaller than Cobo Hall, will have a total area of 482,510 gross square feet. The teaching-research facility, at the southeast corner of Canfield and Brush, will help make it possible to increase the WSU medical school class from 125 to 200.

AMA Official Describes Primitive Viet Facilities

American physicians are shocked by the primitive facilities at provincial hospitals in Vietnam, said Malcolm E. Phelps, M.D., AMA Vice-President and former chief of the "Volunteer Physicians for Vietnam" program, at an anniversary luncheon of the Michigan Health Council recently. "Some places we have a microscope, some places we don't," he continued.

Sixteen million South Vietnamese civilians have only 158 practicing native doctors and 1,800 hospital beds. These beds are often occupied by two, three, or four patients, while others are bedded on the floor, Doctor Phelps said.

Tuberculosis, he reported, is the most prominent disease, and most of the people have intestinal parasites. Opportunities for disease observation are unlimited, the AMA Vice-President said. "I can show you acres of anything you can name."

ROSELAWN MANOR

Corrective Action Needed

Any improvement in the public relations of the physician and the medical society must be earned through the day to day conduct of each physician in his private practice. The remaining time is short and the need for corrective action is now. The image of the modern physician must be projected as that of a highly trained scientist who also possesses an understanding heart; a master of the heart as well as the science of medicine.

—Charles E. Farber, M.D., President,
Kent County Medical Society
Excerpts from "President's Message,"
Bulletin of the Kent County Medical Society

ANDERSON TO HEAD U-M HEALTH SERVICE

Robert E. Anderson, M.D., formerly of Flint and now of Ann Arbor, is the new director of the University of Michigan Health Service. A graduate of Michigan State University and the University of Michigan Medical School, he has been a member of the U-M Health Service staff since 1966. Doctor Anderson is a Fellow of the American School Health Association and the American College Health Association and a member of the American College of Sports Medicine.

To fight TB-
find it first!

Make tuberculin testing routine
with every physical examination.

TUBERCULIN, TINE TEST
(Rosenthal)

Side effects are possible but rare: vesiculation, ulceration, or necrosis at test site. Contraindications: none, but use with caution in active tuberculosis. Available in 5's and 25's.

Mental and Public Health Expenditures For State Reported

Several observations may be made from a study of the three accompanying tables and other data in the *Michigan State Economic Record.*

The following notes are observable from the data:

1. State expenditures on mental health have increased from $34,671,000 in 1950 to $122,674,000 in 1967, or a 254% increase over the 18 year period.

2. State expenditures on public health have increased from $16,791,000 in 1950 to $36,119,000 in 1967, or a 115% increase over the 18 year period.

3. The allotment of funds for mental and public health purposes, although constantly increasing over the years, has maintained a rather constant percentage of total state expenditures (6% and 2% respectively).

The Detroit Maternity and Infant Care Project, funded in 1964 under a U.S. Children's Bureau grant to the Detroit Department of Health, gives maternity and infant care services for high risk medically indigent families. The staff, directed by William F. Goins, M.D., has given care to approximately 3,000 patients. The above photo was taken at one of the six hospital clinics.

4. Percentage changes in mental and public health expenditures seem to be on the upswing in the latter sixties with greater gains being made in the mental health area.

It should also be noted that the 1968 schedule of state expenditures shows no significant change in past trends in the mental and public health fields.

These three tables are from *Michigan State Economic Record,* Vol. 10, No. 4.

TABLE I
STATE EXPENDITURES
(in thousands)

Year	Mental Health	Public Health	Total Expenditures** (all functions)
1950	$ 34,671	$16,791	$ 556,519
1955	45,860	20,270	757,846
1960	71,681	25,422	1,107,786
1961	75,957	23,698	1,175,138
1962	81,517	25,652	1,243,830
1963	83,475	25,556	1,306,335
1964	87,206	29,296	1,405,490
1965	93,974	31,293	1,535,996
1966	104,632	35,780	1,822,255
1967	122,674	36,119	2,194,257

Table I shows the actual dollar amounts spent on mental and public health in Michigan for 1950-67

**includes mental health, public health, education, highways, public welfare, general government, public safety, and other expenditures.

TABLE II
PERCENTAGE OF TOTAL EXPENDITURES

Year	Mental Health	Public Health
1950	6%	3%
1955	6%	3%
1960	6%	2%
1961	6%	2%
1962	7%	2%
1963	6%	2%
1964	6%	2%
1965	6%	2%
1966	6%	2%
1967	6%	2%

Table II shows the percentage of total expenditures allocated to mental and public health in Michigan for 1950-67

TABLE III
PERCENTAGE CHANGE OF MENTAL AND PUBLIC HEALTH EXPENDITURES

Year	Mental Health	Public Health
1950	—	—
1955	3%	2%
1960	6%	2%
1961	6%	−7%
1962	7%	8%
1963	2%	.4%
1964	4%	14%
1965	8%	7%
1966	11%	14%
1967	17%	.9%

Table III manifests the yearly percentage changes of mental and public health expenditures in Michigan for 1950-67.

Marriage Rate Up, Predict New Population Boom by 1978, or Sooner

The Health Insurance Institute reports the United States may soon be in the midst of another population explosion. Current estimates indicate a new baby boom can be expected within five to ten years or possibly sooner.

Total births in 1967 were 3,533,000, almost 100,000 fewer than the previous year. However, professional demographers say that there will be a record number of babies born in the 1970's, with a good chance that the population will double and reach 400 million persons by the end of the century.

The rise in marriages to 1,913,000 in 1967 is one indication that the predictions may be true. Also a new crop of eligible husbands — young men between 21 and 24, in short supply since 1956, are now coming of age.

The Institute further notes that despite the use of birth control pills, the size of families will not necessarily be reduced. The pills are frequently used to allow couples to space their offspring more conveniently.

Irregardless of the pattern of fluctuation, the Institute says the traditional peak baby months of summer are expected to continue. During July, August, and September of 1968 about one million babies are expected to be born in the United States.

Physicians interested in more details can obtain *Health Insurance News,* May 1968, published by the Health Insurance Institute, 277 Park Avenue, New York 10017.

STATE BUSINESSMEN FAVOR TAX CREDITS TO HELP ENCOURAGE REMODELING

The National Federation of Independent Business reports that 63 per cent of the Michigan businessmen who answered a survey favor HR 17252 introduced by Representative Hale Boggs to allow property owners to deduct a part of their costs of renovating old buildings from income tax returns.

The Michigan survey found 32 per cent opposed to the Boggs bill, and five per cent undecided.

The Boggs anti-slum legislation would allow property owners to deduct a portion of money spent to recondition old buildings provided that their usefulness either for rental or business purposes is improved.

The national poll showed 65 per cent in favor, 31 opposed and 4 undecided.

LIABILITY RATES UP IN 22 STATES; NOT MICHIGAN

Revisions in the basic limit rates for physicians and surgeons professional liability insurance in 22 states were announced today by the Insurance Rating Board on behalf of its member and subscriber companies. Michigan was not included.

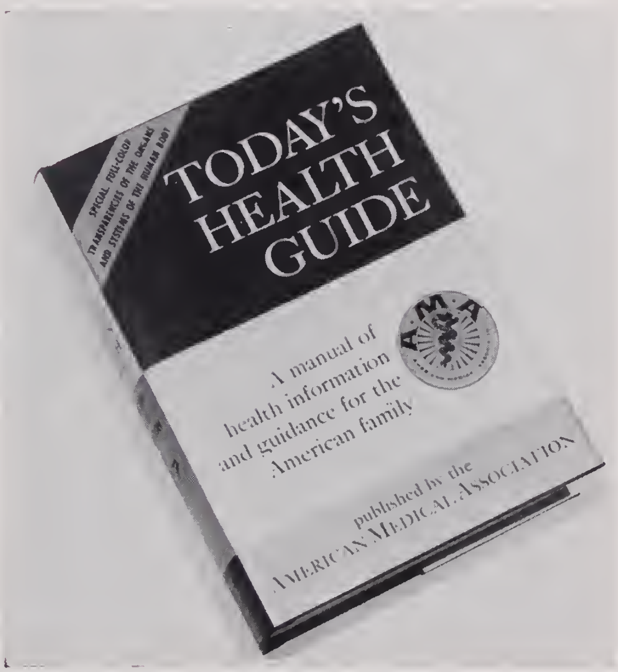
The revisions in basic limit rates result in increases in 21 states and a reduction in one. In the midwest, the Illinois rates went up 20 per cent; Indiana 30 per cent; Ohio 75 per cent. California rates went up 38.2 per cent.

Adverse underwriting experiences were cited as the reasons for the increases.

TEDDY SAID IT WELL

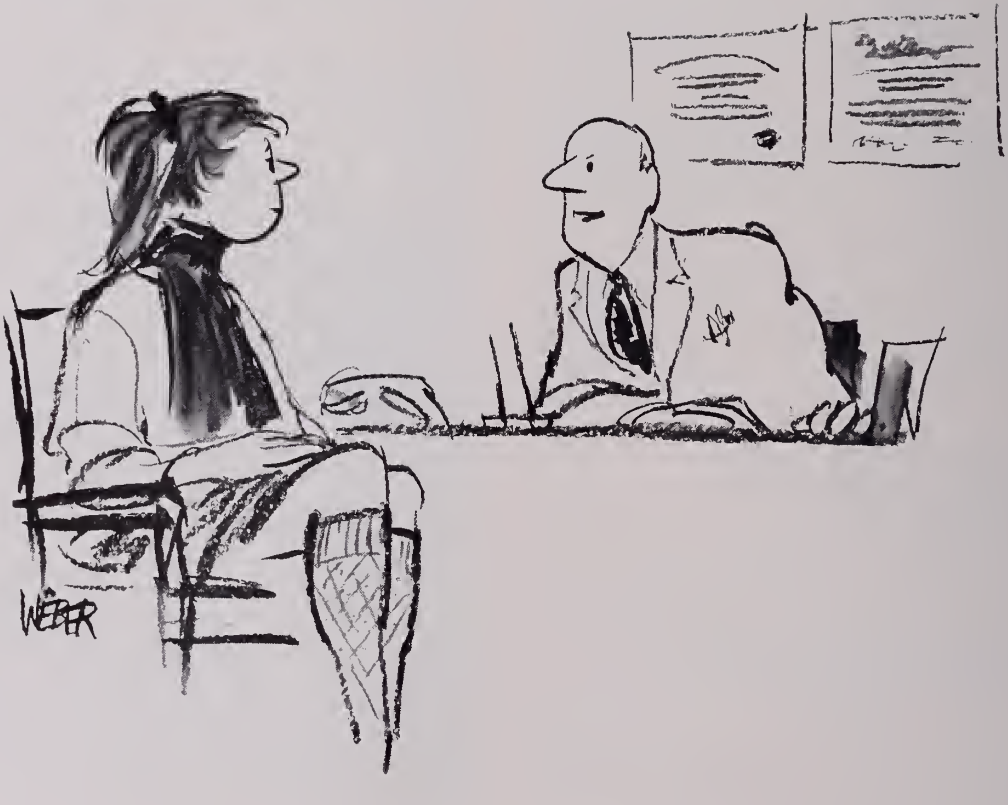
"In a republic like ours the governing class is composed of the strong men who take the trouble to do the work of government, and if you are too timid or too fastidious or too careless to do your part in this work, then you forfeit your right to be considered one of the governing and you become one of the governed instead. . ."

Theodore Roosevelt



SPECIAL: FULL-COLOR TRANSPARENCIES OF THE ORGANS AND SYSTEMS OF THE HUMAN BODY
TODAY'S HEALTH GUIDE
A manual of health information and guidance for the American family
published by the AMERICAN MEDICAL ASSOCIATION

County medical societies are purchasing copies of the AMA Today's Health Guide book for presentation to libraries, schools and other community outlets. The book, which physicians might like to have available in their waiting rooms, contains 640 pages of general advice. Copies are available at cost from the AMA at $5.95. More than 20,000 diseases, illnesses, medical conditions and subjects are thoroughly covered, with more than 300 illustrations.



"Now that your acne is clearing up nicely, it might be a good idea if you started losing some weight."

Get them while they're easily reversible.

Obesity doesn't happen suddenly. This insidious process has its beginning—and the chances of reversing it are better—during the *first 10 to 15 pounds of weight gain.* When a new dietary pattern must be established, consider the adjunctive use of BAMADEX SEQUELS. Combining the proven *anorexigenic* action of d-amphetamine with the *tranquilizing* effect of meprobamate, BAMADEX SEQUELS controls appetite throughout the day, usually with a single capsule daily.

Contraindications: Dextro-amphetamine sulfate: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness. Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

70 Medical Research Projects Supported by Michigan Heart Association

Michigan researchers are now working on 70 Michigan Heart Association supported studies. Total of the grants-in-aid is $551,039. Other expenditures, including $165,000 – 60% of all monies sent to the American Heart Association – brought MHA's total research support during the fiscal year beginning July 1 to about $800,000.

Michael C. Kozonis, M.D., Pontiac, president of the Association, says that, "By the end of this year, our 19th, MHA will have spent about $7,200,000 on research in Michigan." The funding came from the Michigan United Fund, supplemented by Memorial Gifts, money willed or given the Association in honor of a friend or relative, victim of heart disease.

Sixty-one of the projects are in the three Michigan medical schools; 31 at Wayne State; 23 at University of Michigan; and 7 at Michigan State. Three are at Henry Ford Hospital in Detroit, and one each at the Rehabilitation Institute, and Sinai, Providence, and Detroit Memorial Hospitals, all in the Detroit area, the University of Detroit, and Blodgett Memorial Hospital, Grand Rapids.

MHA also gives a total of $70,000 in supplemental funds to the deans of the three medical schools, and uses $17,500 to support the research of medical students. These are in addition to the grants-in-aid, which range from $2,500 to $12,000, and are used to hire technicians and buy supplies.

The researcher, their institutions, and the titles of their projects, follow:

ten the symptoms of anxiety states are
ficult to sort out—even with the most careful
obing. The patient may manifest symptoms of
itation, restlessness, insomnia, somatic
mplaints. But what of the depression that may
mixed in the total picture? It is reassuring
know that Mellaril may be prescribed—with
rong possibilities of success—when there is
xiety alone or a mixture of anxiety
d depression.

Before prescribing or administering, see Sandoz literature for full product information, including adverse reactions reported with phenothiazines. The following is a brief precautionary statement.
Contraindications: Severe central nervous system depression, comatose states from any cause, hypertensive or hypotensive heart disease of extreme degree.
Warnings: Administer cautiously to patients who have previously exhibited a hypersensitivity reaction (e.g., blood dyscrasias, jaundice) to phenothiazines. Phenothiazines are capable of potentiating central nervous system depressants (e.g., anesthetics, opiates, alcohol, etc.) as well as atropine and phosphorus insecticides. During pregnancy, administer only when necessary.
Precautions: There have been infrequent reports of leukopenia and/or agranulocytosis and convulsive seizures. In epileptic patients, anticonvulsant medication should also be maintained. Pigmentary retinopathy may be avoided by remaining within the recommended limits of dosage. Administer cautiously to patients participating in activities requiring complete mental alertness (e.g., driving). Orthostatic hypotension is more common in females than in males. Do not use epinephrine in treating drug-induced hypotension. Daily doses in excess of 300 mg. should be used only in severe neuropsychiatric conditions.
Adverse Reactions: *Central Nervous System*—Drowsiness, especially with large doses, early in treatment; infrequently, pseudoparkinsonism and other extrapyramidal symptoms; nocturnal confusion, hyperactivity, lethargy, psychotic reactions, restlessness, and headache. *Autonomic Nervous System*—Dryness of mouth, blurred vision, constipation, nausea, vomiting, diarrhea, nasal stuffiness, and pallor. *Endocrine System*—Galactorrhea, breast engorgement, amenorrhea, inhibition of ejaculation, and peripheral edema. *Skin*—Dermatitis and skin eruptions of the urticarial type, photosensitivity. *Cardiovascular System*—Changes in the terminal portion of the electrocardiogram have been observed in some patients receiving the phenothiazine tranquilizers, including Mellaril (thioridazine hydrochloride). While there is no evidence at present that these changes are in any way precursors of any significant disturbance of cardiac rhythm, several sudden and unexpected deaths apparently due to cardiac arrest have occurred in patients previously showing electrocardiographic changes. The use of periodic electrocardiograms has been proposed but would appear to be of questionable value as a predictive device. *Other*—A single case described as parotid swelling.

of pain, stiffness and tenderness...and also a lot of f
It might have been different with **Butazolidin® al**

100 mg. phenylbutazone
100 mg. dried aluminum hydroxide gel
150 mg. magnesium trisilicate

If it doesn't work in a week, forge

But please don't forget this:

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently. Large doses of the alka formulation are contraindicated in glaucoma.

Warning: If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. Patients should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately before or after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), or a generalized allergic reaction similar to serum sickness may occur and require permanent withdrawal of medication. Agranulocytosis can occur suddenly in spite of regular, repeated normal white counts. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angiitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Painful Shoulder: Initial: 3 to 6 capsules daily in 3 or 4 equal doses. Trial period: 1 week. Maintenance dosage should not exceed 4 capsules daily; response is often achieved with 1 or 2 capsules daily.

In selecting the appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response.

The Divorced Depressive: "Forty Forgotten

"Had a large wedding."
"Had a fine home and family."

.Forlorn”

d a divorce.”
a real loser,
d so are
kids.”

The loss of marital compatibility results in nearly 500,000 U.S. divorces each year.

Depression characterized by untold guilt feelings, grief and loneliness may follow.[1]

When you diagnose depression, Tofrānil may be indicated for relief.

As maintenance therapy during the active phase of depression, Tofrānil can often help prevent relapse.

The use of Tofrānil in patients receiving M.A.O.I.'s is contraindicated. In patients with cardiovascular disease, thyroid disorders, increased intraocular pressure; in those receiving anticholinergics (including antiparkinsonism agents), thyroid medication or antihypertensive adrenergic neuron-blocking agents; and in those in their first trimester of pregnancy–the special precautions listed in the Prescribing Information should be carefully observed.

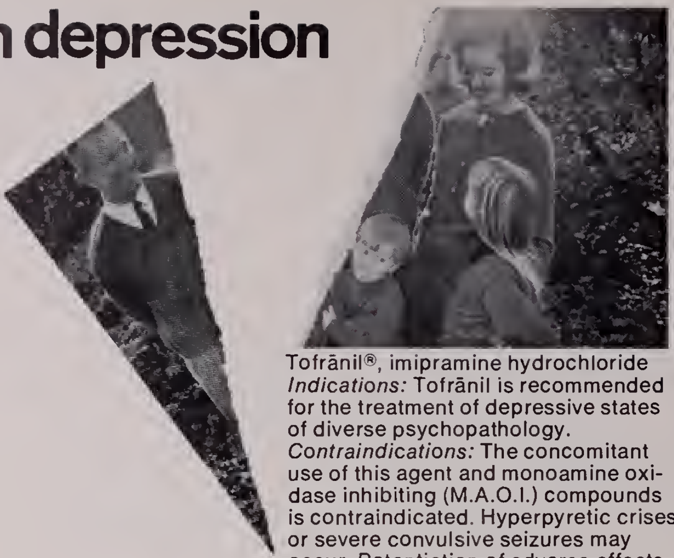
Toxic reactions severe enough to require discontinuation of Tofrānil are uncommon. However, for complete details, please refer to the complete Prescribing Information.

Turn page for brief summary of Prescribing Information.

in depression **Tofrānil®** imipramine hydrochloride

Geigy

in depression



Tofrānil® Geigy

imipramine
hydrochloride

Tofrānil®, imipramine hydrochloride

Indications: Tofrānil is recommended for the treatment of depressive states of diverse psychopathology.

Contraindications: The concomitant use of this agent and monoamine oxidase inhibiting (M.A.O.I.) compounds is contraindicated. Hyperpyretic crises or severe convulsive seizures may occur. Potentiation of adverse effects can be serious or even fatal. An interval of at least 7 days after M.A.O.I. therapy has been discontinued should be allowed before this drug may be substituted. Initial dosage should be low, increases should be gradual, and the patient's progress should be carefully observed.

Warning: Clinical reports have suggested that there may be a risk of teratogenesis associated with the use of this compound during the first trimester of pregnancy. Unless, in the opinion of the prescribing physician, the potential benefits outweigh the possible risks, it should not be used during the first trimester of pregnancy. Cardiovascular complications, including myocardial infarction and arrhythmias, have occasionally occurred in susceptible individuals. Patients with cardiovascular disease should be given the drug only under careful observation and in low dosage.

Precautions: Since suicide is always a possibility in severely depressed patients and one which may persist until significant remission occurs, such patients should be carefully supervised during early treatment. Some severely depressed patients may also require hospitalization and/or concomitant electroconvulsive therapy. Because of its anticholinergic effect, caution should be observed in prescribing the drug for patients with increased intraocular pressure.

In rare instances, transient cardiac arrhythmias have occurred in hyperthyroid patients and in patients receiving thyroid medication when this compound was added to the regimen. Imipramine may block the pharmacologic activity of guanethidine and other related adrenergic neuron-blocking agents.

The drug is not recommended at the present time in patients under 12 years of age.

Adverse Reactions: Dryness of the mouth, tachycardia, constipation, disturbances of accommodation, sweating, dizziness, weight gain, urinary frequency or retention, nausea and vomiting, peripheral neuritis, mild parkinson-like syndrome, tremors, rare cases of falling in elderly patients, confusional states (with such symptoms as hallucinations and disorientation), activation of psychosis in schizophrenics and agitation (including hypomanic and manic episodes) which may require dosage reduction and/or addition of a tranquilizer or temporary discontinuation of the drug, epileptiform seizures, orthostatic hypotension and substantial blood pressure fall in hypertensive patients, purpura, transient jaundice, bone marrow depression including agranulocytosis, sensitization and skin rash including photosensitization, eosinophilia, and mild withdrawal symptoms on sudden discontinuation after prolonged treatment with high doses. Occasional hormonal effects (impotence, decreased libido, and estrogenic effects) may be observed. Atropine-like effects may be more pronounced (e.g. paralytic ileus) in susceptible patients and in those using anticholinergic agents (including antiparkinsonism drugs).

Outpatient Adult Dosage: Initially, 75 mg. daily, increased, if necessary, to 150 or 200 mg. Maintenance dosage may be lower, 50 to 150 mg. daily, if possible.

Geriatric and Adolescent Dosage: Initially, 30 or 40 mg. daily, which may be increased according to response and tolerance. It is usually unnecessary to exceed 100 mg. daily.

A lag in therapeutic response, lasting from a few days to a few weeks, should be expected. When dosage recommendations are already being followed, increasing the dosage does not normally shorten this latency period and may increase the incidence of adverse reactions.

Availability: Round tablets of 25 and 50 mg.; triangular tablets of 10 mg. for geriatric and adolescent use; and ampuls, each containing 25 mg. in 2 cc. for I.M. administration.

et's be specific about Campbell's Soups...
and *reducing diets*

There are more than 30 million people in America who are overweight. During the next year, you probably will see more than 1,000 of them in your own practice.

One good way to help these patients is to give them a reducing diet based on ordinary eating patterns.

Campbell has prepared a sensible plan for weight control based on ordinary eating patterns. The plan consists of a patient instruction booklet and a set of menus which provide approximately 1,200 calories daily. The menus are balanced to provide the minimum daily requirements of nutrients.

To obtain a supply for your office write to:
Campbell Soup Company, Box 265, Camden, N. J. 08101

Campbell's
CONDENSED
SOUP

In childhood

Warnings: Lomotil should be used with caution in patients taking barbiturates and with caution, if not contraindicated, in patients with cirrhosis, advanced liver disease or impaired liver function.

Precautions: Lomotil is a Federally exempt narcotic with theoretically possible addictive potential at high dosage; this is not ordinarily a clinical problem. Use Lomotil with considerable caution in patients receiving addicting drugs. Recommended dosages should not be exceeded, and medication should be kept out of reach of children. Should accidental overdosage occur, signs may include severe respiratory depression, flushing, lethargy or coma, hypotonic reflexes, nystagmus, pinpoint pup s, tachycardia; continuous observation is necessary

Adverse Reactions: Side effects reported w Lomotil therapy include nausea, sedation, dizziness, vomiting, pruritus, restlessness, abdominal discomfort, headache, angioneurotic edema, giant urticaria, lethargy, anorexia, numbness of the extremities, atropine effects, swelling of the gums, euphoria, depression and malaise. Respiratory depression and coma may occur with overdosage.

Dosage: The recommended initial daily dosages given in divided doses until diarrhea is controlled, are as follows:

diarrheas...

- careful supervision
- electrolyte replacement
- specific anti-infective therapy

and...

LOMOTIL®

TABLETS/LIQUID

Each tablet and each 5 cc. of liquid contains:

diphenoxylate hydrochloride (Warning: May be habit forming)	2.5 mg.
atropine sulfate	0.025 mg.

LOMOTIL, in conjunction with specifically indicated medical management, may be lifesaving in children with severe diarrhea.

Lomotil lowers the excessive intestinal propulsion characteristic of diarrhea. This reduction of precipitate intestinal flow allows a normal or more nearly normal reabsorption of fluid and electrolytes and counteracts the dehydration so hazardous to children.

Moreover, eight years' experience has demonstrated that Lomotil controls diarrhea with a minimum of unwanted secondary actions.

Senra del Valle and his associates[1] conducted a study of 477 children with diarrhea, most of whom were hospitalized with the disorder. Lomotil, used in 407 of the children, shortened the duration of the diarrhea.

Grinszpan, Goldstein and Divito[2] used Lomotil in 20 children with diarrhea and also reported a prompt disappearance of diarrhea. Harris and Beveridge[3] in a double-blind study of 50 children with diarrhea, however, found no clear pattern to suggest that Lomotil influenced the course of the condition.

Michener, Brown and Turnbull[4] added evidence supporting the beneficial effects of Lomotil in 80 children, concluding that Lomotil was highly useful in controlling abdominal cramping, diarrhea and hypermotility.

hildren: Total Daily Dosage

3-6 mo.	½ tsp.* t.i.d. (3 mg.)
6-12 mo.	½ tsp. q.i.d. (4 mg.)
1-2 yr.	½ tsp. 5 times daily (5 mg.)
2-5 yr.	1 tsp. t.i.d. (6 mg.)
5-8 yr.	1 tsp. q.i.d. (8 mg.)
8-12 yr.	1 tsp. 5 times daily (10 mg.)
dults:	2 tsp. 5 times daily (20 mg.) or 2 tablets q.i.d.

ased on 4 cc. per teaspoonful.

laintenance dosage may be as low
s one-fourth the initial daily dosage.

OMNI-TUSS® b.i.d.

. . . because OMNI-TUSS is indicated for cough associated with upper respiratory tract infections, bronchitis, bronchiectasis, bronchial asthma, emphysema, sinusitis and rhinitis, hay fever, or other allergic conditions. Any of these conditions may exhibit the general symptom syndrome—coughing, wheezing, bronchospasm, and tenacious mucus—which may benefit from the antitussive, bronchodilative, antihistaminic, and expectorant action of Omni-Tuss.

The therapeutic usefulness of Omni-Tuss is enhanced by a unique resin complex formulation providing the clinically desirable advantages of: (1) uniform drug availability throughout an extended period, (2) 8 to 12 hours of symptomatic control, (3) minimal dosage requirement, (4) minimal side effects.

Economical, efficient **b.i.d.** dosage—extremely well-tolerated by children, 6-12, and adults.

'Omni Tuss' Suspension: Each teaspoonful (5 cc.) contains 10 mg. codeine (Warning: May be habit-forming), 5 mg. phenyltoloxamine, 3 mg. chlorpheniramine, 25 mg. ephedrine, all as cation exchange resin complexes of sulfonated polystyrene, and 20 mg. guaiacol carbonate.

Available on prescription only. Class X exempt narcotic. Permissible on oral prescription.

Dosage: *Adults:* 1 teaspoonful (5 cc.) q12h.
Children (6-12 *years*): ½ teaspoonful q12h.

Side Effects: Minimal, but when encountered may include jitteriness, nausea, drying of mouth, insomnia, constipation, which disappear upon adjustment of the dose or discontinuance of treatment.

Precautions and Contraindications: For complete detailed information, refer to package insert or official brochure.

When it's more than a bad cold

your patient can feel better
while she's getting better

Achrocidin®

Tetracycline HCl—Antihistamine—Analgesic Compound

Each tablet contains: ACHROMYCIN® Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Caffeine 30 mg.; Salicylamide 150 mg.; Chlorothen citrate 25 mg.

In tetracycline-sensitive bacterial infection complicating respiratory allergy, ACHROCIDIN brings the treatment together in a single prescription—prompt relief of headache and congestion together with effective control of the organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

For children and elderly patients you may prefer caffeine-free ACHROCIDIN Syrup. Each 5 cc contains: ACHROMYCIN (Tetracycline) equivalent to Tetracycline HCl 125 mg.; Phenacetin 120 mg.; Salicylamide 150 mg.; Ascorbic Acid (C) 25 mg.; Pyrilamine Maleate 15 mg.

Contraindications: Hypersensitivity to any component.

Warning: In renal impairment, since liver toxicity is possible, lower doses are indicated; during prolonged therapy consider serum level determinations. Photodynamic reaction to sunlight may occur in hypersensitive persons. Photosensitive individuals should avoid exposure; discontinue treatment if skin discomfort occurs.

Precautions: Drowsiness, anorexia, slight gastric distress can occur. In excessive drowsiness, consider longer dosage intervals. Persons on full dosage should not operate vehicles. Nonsusceptible organisms may overgrow; treat superinfection appropriately. Treat beta-hemolytic streptococcal infections at least 10 days to help prevent rheumatic fever or acute glomerulonephritis. Tetracycline may form a stable calcium complex in bone-forming tissue and may cause dental staining during tooth development (last half of pregnancy, neonatal period, infancy, early childhood).

Adverse Reactions: *Gastrointestinal*—anorexia, nausea, vomiting, diarrhea, stomatitis, glossitis, enterocolitis, pruritus ani. *Skin*—maculopapular and erythematous rashes; exfoliative dermatitis; photosensitivity; onycholysis, nail discoloration. *Kidney*—dose-related rise in BUN. *Hypersensitivity* reactions—urticaria, angioneurotic edema, anaphylaxis. *Intracranial*—bulging fontanels in young infants. *Teeth*—yellow-brown staining; enamel hypoplasia. *Blood*—anemia, thrombocytopenic purpura, neutropenia, eosinophilia. *Liver*—cholestasis at high dosage.

Upon adverse reaction, stop medication and treat appropriately.

An anorectic will help her lose weight—but can she keep it off? You need more than a pill (even ours) to do that!

That's why Abbott offers you a pill plus a program.

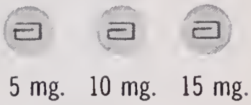
ABBOTT

The Product

For smooth appetite control plus mood elevation

DESOXYN® Gradumet®

Methamphetamine Hydrochloride
in Long-Release Dose Form



For patients who can't take plain amphetamine

DESBUTAL® 10 Gradumet

10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet

15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

The Program

Weight Control Booklet

Specifically written to help your patients understand why they are overweight, and what they can do about it. The booklet stresses the importance of *changing lifelong eating habits* and explains how this can be done, sensibly, comfortably—and permanently. There is, also, a comprehensive list of foods showing their caloric content.

the
secret
of
controlling
your weight

Food Diary

Designed to help the overweight patient follow your eating instructions. Space is provided for breakfast, lunch, supper, and even snacks. By writing down everything that's eaten each day, the patient is constantly reminded that she's trying to change her eating habits. And you are furnished with a written record of how well she's doing.

Picture Menu Booklet

A large (10″ x 10″) booklet which features appetizing lunch and dinner menus for every day of the week. The meals are depicted in full color and the correct portion size so that the dieter can see the amount of food that's recommended. Patients are pleasantly surprised to learn that each day's meals add up to only 1,000 calories.

Brief Summary

DESOXYN® Gradumet®
Methamphetamine Hydrochloride
in Long-Release Dose Form

DESBUTAL® 10 Gradumet
10 mg. Methamphetamine Hydrochloride,
60 mg. Sodium Pentobarbital

DESBUTAL 15 Gradumet
15 mg. Methamphetamine Hydrochloride,
90 mg. Sodium Pentobarbital

Indications: Desoxyn and Desbutal are used orally as appetite suppressants, for reduction of mild mental depression, and to help in management of psychosomatic complaints or neuroses. Desoxyn, when administered parenterally, may be used as a vasopressor agent or analeptic.

Contraindications: Methamphetamine (in Desoxyn and Desbutal) is contraindicated in patients taking a monoamine oxidase inhibitor. Do not use pentobarbital (in Desbutal) in persons hypersensitive to barbiturates.

Precautions, Side Effects: Observe caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs. Prolonged usage may lead to tolerance or psychic dependence. Careful supervision is necessary to avoid chronic intoxication and drug dependence.

Amphetamine side effects such as headache, excitement, agitation, palpitation or cardiac arrhythmia usually may be controlled by reducing the dose. Paradoxically-induced depression is an indication to withdraw the drug. Pentobarbital (in Desbutal) may cause skin rash. Nervousness or excessive sedation with Desbutal is often transient.

...a checklist for updating your ECG

If you bought your present cardiograph several years ago, are you aware of the many improvements that have been designed into new ECG equipment for greater reliability and diagnostic accuracy?

- √ High frequency response for diagnostically accurate tracings
- √ Dependable, trouble-free service
- √ Adaptable for auxiliary use, such as phone transmission of ECG's, heart sound recording, recording Achilles tendon reflex to determine patient's thyroid dysfunction
- √ One-half, standard, and double standardization on all leads
- √ Fast switching from lead to lead — 25 or 50mm. recording speeds
- √ Ease of operation; light weight; attractive styling

Take another close look at your ECG. Does it give you these important advantages? Ask your Burdick dealer to demonstrate the EK 4 — it's an excellent investment for your practice or department.
